## CHAPTER V.

### STATISTICAL REVIEW OF PROFESSIONAL SCHOOLS.

The statistics of theological schools are given more fully than those of either law or medicine. This is to be explained in part by the fact that medical and law schools so frequently constitute departments of universities, in the use of whose buildings, grounds, and funds they are allowed to participate; while according to the American idea of entire separation of church and state, theological schools can not form part of those universities at least which are supported by State governments. Although about one-third of the theological schools made no report as to the value of grounds and buildings and the amount of endowment funds, the remaining schools reported grounds and buildings to the value of \$12,057,747 and endowment funds to the amount of \$16,083,683, while benefactions for the one year aggregated over \$1,000,000. The endowment funds reported from medical schools aggregated only \$749,992, and although these figures are below the real amount, it nevertheless remains true that medical schools are practically without endowments. From law schools the amounts reported were so small that they were not tabulated. Although medical schools have such meager endowments they own much valuable property, frequently near the center of large cities. From the schools reported the value of property is \$8,130,422. Tables 5 to 20 show the increase in the number of schools and attendance for five years.

TABLE 1.—*General summary of statistics of professional and allied schools for 1894-95.*

| Class of schools.   | Schools. | Instructors. | Students. | Graduates. |
|---------------------|----------|--------------|-----------|------------|
| Theological.....    | 149      | 906          | 8,050     | 1,598      |
| Law.....            | 72       | 604          | a 8,950   | 2,717      |
| Medical.....        | 151      | 3,909        | b 22,887  | 4,827      |
| Dental.....         | 45       | 968          | 5,347     | 1,297      |
| Pharmaceutical..... | 39       | 317          | 3,859     | 1,067      |
| Veterinary.....     | 9        | 132          | 474       | 155        |
| Nurse training..... | 131      | .....        | 3,985     | 1,498      |
| Total .....         | 596      | 6,836        | 53,552    | 13,159     |

a 65 of these were women.

b 1,413 of these were women.

Religious instruction under the London school board. (Report for 1892-93, Vol. I, pp. 208-218.)

*Topical outline: General educational policy and statistical summary—Elementary schools; relation of government to; comparative statistics—Renewal of the agitation respecting religious instruction in board schools and of public support for denominational schools.*

A sense of public responsibility with respect to the education of the masses and a deep-seated regard for local independence and local initiative mark the educational policy within the British Empire. It is the excess of one or the other of these principles which gives special character to this policy as it operates in Great Britain, in Ireland, in the colonies, and in British India and other dependencies.

---

<sup>1</sup> Prepared by Miss Anna Tolman Smith.

The feeble beginning in 1833 (i. e., the appropriation of \$100,000 for school buildings) scarcely foreshadowed the part which the General Government was to take in the development of this interest in Great Britain. Without encroaching at all upon local rights or assuming local obligations, it has become the organizing power in elementary education and the chief source of its support, contributing in 1893-94 about 67 per cent of the income of elementary schools in England and 73 per cent in Scotland. Nearly one-third of this appropriation, amounting to \$10,213,800 for England and to \$1,629,600 for Scotland, was the grant in lieu of fees. Local taxes (rates) supplied 19 per cent of the income in England and 22 per cent in Scotland, leaving about 15 per cent derived from private sources in the former division and less than 5 per cent in the latter.

In England, as yet, only elementary instruction has been brought into the form of a system, which is determined in its main features by the law of 1870. The law, passed two years later (1872), for Scotland has a more extensive range. In this, secondary schools are distinctly recognized; moreover, Scotch universities have a very close relation to the Government, since parliamentary grants provide the larger part of their income. Hence, scholastic institutions of all grades in Scotland have a basis for organic union, which is wanting in England. Nevertheless, taken in its full sense, the word system must be considered as relating only to the elementary schools of Scotland, which are organized on substantially the same lines as those of England.

The following summary presents the principal statistics pertaining to universities and elementary schools for the year under review:

*Educational statistics.*

a Average number on rolls; the number of pupils who made at least one attendance during the year was 1,028,281.

b In addition to pupils in elementary schools receiving grants from the science and art department.

c Parliamentary grant for use in the work of the department, 1894-95.

The entire province of secondary instruction is omitted from the above table, as no summaries for this department are attainable. Recent estimates place the number of pupils pursuing secondary studies in England and Wales at 890,000, including the 90,000 pupils in higher board schools. In Scotland 73 secondary schools (i. e., 30 public high schools, 24 endowed schools, and 19 private schools) have submitted to the scheme of government inspection. The number presenting candidates for the government "leaving certificate" in 1894 was 270, and the number of candidates 13,173. The intermediate education board of Ireland, a public examining body, reports 6,974 students (5,265 boys and 1,709 girls) as coming up for examination in 1894.

## ELEMENTARY EDUCATION.

*Supervision and control.*—In both divisions of Great Britain, the action of the General Government with respect to elementary education is directed to securing through local agents sufficient school accommodation, and an adequate outcome for the money appropriated from the public treasury. This action is exercised through committees of the privy council (education department for England and the same for Scotland). The vice-president of each committee<sup>1</sup> is the virtual head of the respective system, and represents its interests in the House of Commons when the appropriations or general regulations (codes) are under discussion. The local managers with whom the department deals are: (1) Elected boards serving for three years; (2) private bodies (churches, corporations, etc.), whose schools are subject to Government inspection. Prior to 1895 every school was examined once a year by a Government inspector, who tested each class in the work of a prescribed programme, examined the buildings and premises with reference to specified requirements, and passed judgment upon the general organization and conduct of the school. By the regulations of 1895, schools that have reached a certain standard are now excused

<sup>1</sup> Right Hon. A. H. Dyke Acland, vice-president for England at the date of the last report issued, was succeeded, in July, 1895, by Sir John Gorst. The vice-president for Scotland is Lord Balfour, of Burleigh.

from the ordeal of a rigid examination; in place of this may be substituted two annual visits from the inspector, the visits to be made without notice. On these occasions the inspector is to test the instruction and the general condition of the school, and from the notes taken at the time to make up his report. The rate of grant allowed is determined by this report.<sup>1</sup> Thus virtually ends the system of "payment upon results."

For the maintenance of the inspection, England is divided into ten districts, each under a chief inspector. Under these is a force of 107 inspectors, 45 subinspectors, and 152 inspectors' assistants. There are also 2 chief inspectors for training colleges, a special inspector of music, a directress of needlework, and an inspectress of cookery and laundry work.

Scotland is divided into three districts, each having a chief inspector. Under these are 25 inspectors, 4 subinspectors, and 21 assistants.

*Elementary day schools; accommodation, enrollment, and average attendance.*—By the combined action of public and private agencies, school accommodation has been provided in England for 5,873,098 children, 77 per cent of the total number 3 to 14 years of age both inclusive, and in Scotland for 785,207, 82 per cent of the children 5 to 14 both inclusive.

For the year under review (1893-94) the total enrollment was for England, 5,235,887, and for Scotland, 699,716.

The detailed statistics and comparative views presented in the annual reports include only the schools actually inspected during the current year, a number always a little below the total on the list.

The following table gives the principal statistics in comparison with the same, for earlier dates. The date selected for England, 1876, was

<sup>1</sup>The grant is composed as follows:

(1) A fixed grant of 12½s. to 14s. (10s. to 14s. Scotland) per pupil in average attendance.

(2) A grant of 1s. to 1½s. for discipline and organization, reckoned on average attendance.

(3) Various grants in class and specified subjects. In Scotland a grant of 1s. to 3½s. is also allowed, according to the report on the general character of the instruction in the three elementary subjects. Special grants (£10 to £15) are also allowed under specified conditions for schools in thinly populated districts. Grants of £1 to £5 are also allowed in respect to each pupil teacher required to make up the minimum staff who passes a specified examination and of £10 to £15 for each assistant teacher passing the examination for a Government certificate. The total annual grant to a school, exclusive of the special grants to schools in sparsely settled regions, must not exceed 17s. 6d. for each unit of average attendance or the total income from all other sources. In other words, the Government seeks to stimulate, but not to replace, local effort.

In England infant schools are treated separately, grants for them reckoned on the basis of average attendance being:

(1) Fixed grant, 7s. to 9s. per capita of average attendance.

(2) Variable grant, 2s., 4s., or 6s.

(3) Grant for singing, 6d. or 1s.

(4) Grant for needlework, 1s. per capita of average attendance of girls.

marked by the passage of the first amendment to the law of 1870, constituting school attendance committees in districts where no boards were elected:

| Current expenditures..   | \$16,584,356       | \$44,513,316 | +163.45                     | \$4,122,879 | \$6,730,743 | + 63.25                     |
| Government grant.....  | 7,457,684          | 29,766,300   | +299                        | 2,157,898   | 4,758,291   | +120.56                     |

It will be seen from the above table that the progress of elementary instruction has far outstripped the growth in population, and that it is marked not only in respect to the enrollment of pupils, but in respect to conditions which may be taken as proofs of improvement in the system; such are the increase in average attendance, which exceeds that of enrollment, and the increase in the number of adult teachers, with a corresponding decline in the number of pupil teachers. As the deficiency of school provision existing when the Government began its active efforts is overcome, the progress of the system is necessarily less decided than at first, nevertheless the growth from year to year more than keeps pace with the increase of population.

Comparing the statistics of 1894 with those of 1893, it appears that in England the increase of the population during the year is estimated at 1.09 per cent; the enrollment shows an increase of 1.41 per cent; the average attendance, an increase of 3.07 per cent. The enrollment was equivalent to 17.29 per cent of the population.

In Scotland, while the estimated population shows an increase over 1893 of 0.8 per cent, the enrollment has increased by 3.23 per cent and the average attendance by 4.53. Here the enrollment is equivalent to 16.64 per cent of the population.

Sufficient time has elapsed to determine the effect that remission of fees (laws of 1891, England; of 1889, and 1890, Scotland) has had upon school attendance.

As regards England, it was noted in the report for 1892-93 that the increase in the numbers on the school registers and the improvement in the regularity of attendance, as compared with the same for 1891-92, were nearly as much marked among the older children as among the "infants" (i. e., children under 7 years of age).

Comparison of the statistics for 1893-94 with those of 1892-93 shows that the increase in the enrollment of older pupils surpassed that of the younger.

The detailed statistics under this head are as follows: The number of infants on the registers has gone up from 1,813,992 to 1,830,994, an increase of 17,002 (0.94 per cent), and that of older children from 3,312,381 to 3,367,747, an increase of 55,366 (1.67 per cent). The number of infants in average attendance has risen from 1,278,798 to 1,320,856, an increase of 42,058 (3.29 per cent), and that of older children in average attendance from 2,821,232 to 2,904,978, an increase of 83,746 (2.97 per cent).

In Scotland, where the school age is 5 to 14 (as against 3 to 14 in England), the attendance of younger children has never been large. Here it is observed that the remission of fees has increased the attendance of children of earlier years, and even brought into school many who are under school age.

These results are sufficient to dispel the fears expressed in some quarters that parental interest in the education of children would decline with the relief from fees.

#### FINANCES.

The total income of elementary schools (evening included) for 1893-94 was, in England, £9,178,178 (\$44,661,014); in Scotland, £1,383,219 (\$6,730,743.63), derived as follows:

|   | England.         | Scotland.        |

The total expenditure in England was \$44,513,316.45; in Scotland, \$6,730,743.65.

Fees remitted in Scotland by laws of 1889 and 1890 and in England by law of 1891 may still be charged if managers forego the fee grant and parents make no objection. That free schools are generally desired is indicated by the fact that in England 82 per cent of elementary schools and in Scotland the entire number are now free for children of legal school age—3 to 14, inclusive, in the former; 5 to 14, inclusive, in the latter.

Besides the proportional part of the current income furnished from local sources, as shown above, local managers must provide buildings and equipments. The general government has aided in this work by loans amounting in England to £29,468,477 5s. 8d. (\$143,393,610.46), and in Scotland to £5,702,957 1s. 11½d. (\$27,750,593.63).

#### RECENT MOVEMENTS RELATIVE TO RELIGIOUS INSTRUCTION AND TO PUBLIC SUPPORT FOR DENOMINATIONAL SCHOOLS.

The question of religious instruction in State-aided elementary schools, and in general that of the relation of the State to denominational schools, is again disturbing England.

The events of 1894 relating to this periodical agitation were set forth in the Commissioner's report for 1892-93. The subject was reopened during that year by the efforts of certain members of the London school board to establish a religious test for teachers. The effort was apparently abandoned and the whole subject dropped as a consequence of the school board election. The constitution of the new board for London, which came into control of the schools in December, was sufficient proof that the endeavor to reopen the religious controversy was not supported by the electors. The "Progressives," who oppose sectarian teaching, actually polled 150,000 more votes than their opponents, and the majority of the latter in the board was reduced from 15 to 3, and even these were known to be opposed to any disturbance of the "settlement of 1870." So far as the London board was concerned, the discussions of the previous year had centered in "the test circular for teachers." This circular explained that the religious instruction allowed in board schools should be held to include "a belief in God the Father as our Creator, God the Son as our Redeemer, and God the Holy Ghost as our Sanctifier." It stated, however, that teachers who could not conscientiously give the instruction in that sense might seek relief from the obligation. At the time the circular was issued (March, 1894) there were 8,902 teachers under the board giving religious instruction. Of these, 5,772 accepted the circular without protest, 6 applied individually for relief, and 3,127 applied collectively through the Metropolitan Board Teachers' Association. The appeal in this form was disregarded by the board, but a second circular letter was addressed to the signers asking if they personally desired to be relieved from giving the religious instruction in the sense explained in the circular. To this inquiry 8 responded affirmatively, 230 negatively, while 2,886 took no notice of the question.

On account of the attitude assumed by the teachers in the last-named group, the promotion of one of the number was opposed by Mr. Athelstan Riley, the author of the circular. His course in the matter was made the subject of investigation, and for several weeks excitement ran high in the board meetings and was reflected in the press.

The endeavor of Mr. Riley "to carry on a private inquisition" into the religious opinions of teachers was held to be a violation of a rule of the board, which reads as follows:

The religious opinions of teachers are not to influence their selection, nomination, appointment, or promotion, nor are teachers or candidates for appointment as teachers to be subjected to any questions with reference to their religious belief or as to the possession or otherwise of certificates which might be taken as indicative of belonging to any particular denomination, nor are inquiries to be made into the religious beliefs of teachers, either by committees of the board, local managers, or by any other person having any connection with the board.

Very few even of the Clerical party were prepared to defend Mr. Riley's course and it was virtually condemned by an amendment to a resolution calling for his resignation from the committee on teachers.

The amendment, which passed by a vote of 26 to 0, 10 members not voting, was as follows:

That the board is of opinion that any member who can not conscientiously act in the spirit of Rule 15 of the code of regulations should not serve upon the teaching staff subcommittee, and that the school management committee be informed of this resolution.

While the matter was under discussion in the London board, the unexpected defeat of the Liberal party at the polls reopened for the entire country the question of public support for denominational schools.

Leading conservative candidates for Parliament had made pledges in favor of additional aid to these schools from public funds. An important principle is here at stake—the appropriation of public money where public control can not be exercised. This principle is already strained in the grants made to denominational (i. e., voluntary) schools, and it is held by opponents that the policy should be abandoned instead of being extended. The admission of parochial schools to the benefit of local taxes would be resisted even more resolutely than a measure for increasing their resources from the public treasury.

The short session of Parliament that followed the election gave no time for any positive action in the matter. Meanwhile both parties are deploying all their forces for the contest and the air is full of compromise proposals. The importance of the principles and interests involved and the intense excitement which the controversy arouses will be best understood in the light of these proposals and the utterances which they have evoked. The watchword of the advocates of the denominational schools, "The intolerable strain to which these schools are now subjected," was supplied by Mr. Balfour, the leader of the House of Commons, in a letter addressed to Lord Cranborne, August 22. The expression "intolerable strain" was immediately seized upon and has been the text of appeals and addresses ever since. Under this phrase the sum that churchmen pay for the privilege of controlling the education of 45 per cent of the school children is concealed. From a careful analysis of the figures it appears that out of every £2 paid for a child in a "voluntary school the country provides

all but about 6 or 7 shillings—reckoning, of course, the fees paid by some of the children as part of the money paid by the country. Church voluntary contributions provide about three and sixpence in the pound, and it is by no means certain that the whole of what little money they have voluntarily contributed should all be accredited to elementary education.” In the letter already referred to Mr. Balfour not only gave expression to his personal desire to relieve the strain, but added, “this is, I believe, the general wish of the party and of the Government.”

The premier, Lord Salisbury, since assuming the office, has defined his own position in the subject by referring to his speech made in May last, before the cabinet crisis. At that time he said :

I do earnestly claim for the Church of England the right that the parents who belong to the Church of England should bring up their children in their own way. I claim the same right for the Roman Catholics. I claim the same right for the Nonconformists.

What I urge above all things is that each parent should bring up his child in his own belief, undiminished and unquestioned, and should not attempt the impossible—almost profane—task of trying to boil down different beliefs into one common profession.

I earnestly press on all who hear me to value in the first instance, above all, that the children of all should be brought up to believe in the religion of their parents.

Naturally with these assurances of support from the Government chiefs the Church party, which a few months since was facing the possibility of disestablishment, is aroused to a determined effort in behalf of its educational forces.

The modes of relief proposed by the advocates of denominational schools as already stated are (1) increase of funds from the public treasury and (2) admission of denominational schools to a share in the local taxes (rates). Under the first head falls the bill proposed by “The National Society for the Education of the Poor in the Principles of the Established Church.”

This bill proposes—

to treat all schools alike, whether board schools or voluntary; to abolish entirely what is called “payment by results” and to continue the fee-grant as at present, and to appropriate the only other Government grant to paying the salaries of teachers; all schools are still to pay from local sources (either subscriptions or rates) a fractional part of the salaries, at the rate of 5s. per head, upon the average attendance, the grant paying all the rest; and the teachers are to be appointed and controlled by the local managers, and may be dismissed by them, but with a right of appeal.

A second scheme, submitted by an eminent churchman, simply proposes that the Government grant to all schools shall be increased by 5s. per capita of average attendance.

The Roman Catholic proposal calls for the support of elementary education in schools of all classes entirely from public funds, the additional help required to come from the rates; gives to any person or persons “the power to found a new school in any school-board district if the parents of at least 30 children of school age desire it and

intend to use it; and it gives to every such school the right to claim and receive support both from the education department and from the rates."

All of the above proposals agree in opposing public control of sectarian schools.

A species of representative management is indeed recognized in the Roman Catholic scheme by the provision "That the managers of such schools shall be representative by this way: That there shall be for every five managers two appointed by the parents of the scholars and three by the trustees or founders—none by the ratepayers as such."

Under any one of these proposals what is known as the 17s. 6d. limit would disappear; that is, the amount of Government grant to any school would no longer, as now, be limited to 17s. 6d. per capita of average attendance, or to an amount equal to that from local sources. In other words, it would become possible for a denominational school to be supported wholly by grants. Compromise measures are offered also by the advocates of board schools. The National Union of Elementary Teachers proposes a new special grant of 10s. per head; this grant to be exempted from the operation of the 17s. 6d. limit, and all of it to be spent year by year upon the staff and appliances of the school.

There should be no diminution of rates, fees, or subscriptions on account of this grant.

Every voluntary school to have a "competent body of managers," conducting their business in a formal manner approved by the Department, and, of them, a certain number or proportion to be nominated by the Education Department.

Mr. Spottiswoode, well known in the educational world, submitted a bill, of which the main points are (1) that it provides for rate aid to all schools, and (2) "that it secures full denominational teaching on condition of representative management."

The determined attitude of the great religious bodies in the questions at issue does not argue well for the ultimate permanent success of compromise measures.

At the church congress held in October the report of a committee appointed by the archbishops to propose a plan for the further aid of voluntary schools was presented by the chairman, Canon Scott. "The committee were unanimous in agreeing that the voluntary schools should not be given up. They advised churchmen to demand the abolition of the 17s. 6d. and other limitations upon the grant earned, and the freeing of the school buildings from rates and taxes." They also recommended further legislative facilities for the confederation of schools, i. e., to enable the church schools to help one another. The report then discusses three important questions: (1) The religious question; (2) The source of further financial aid; (3) The school board veto upon so-called "unnecessary" schools. On the first head the committee held that the only course is to provide church schools for church

children, and Roman Catholic schools for Roman Catholic children, "for thus only is it possible to secure that the teachers shall be appointed with a real care for their religious influence and teaching, as well as for their secular acquirements."

The second question, which followed directly from this, was the question of additional financial support. On this point Canon Scott said:

The committee had before them every proposal for rate aid. Now, all rate-aid schemes fall under one of two heads—either a subvention from the rates by the local authority or the power to the ratepayer to allocate his share of the school rate to a particular school. It does not seem to me that the supporters of either of these proposals have worked out their plans completely. It has not been taken into account, that, except the large cities, very few towns can afford such an increase to the local rates. There is a further question. Rate aid involves representative management. No plan has yet been proposed which does not leave the representatives of the church in a minority upon the management. Rate aid having thus failed to provide a safe remedy for our troubles, the archbishops' committee recommended an appeal for increased aid from the Imperial Government, such aid to go toward the teaching staff. This proposal has three great advantages. It would secure an adequate, proportionate, and fairly paid teaching staff in every school; it would effectually eliminate competition between board and voluntary schools in the only place where competition is of serious consequence; it earmarks the Government grant so that the managers are simply the paymasters, and therefore they have no opportunity of abusing public money; they must put it to the purpose for which it was intended; and it avoids the question of representative management.

The third point in the bill—

is the liberty to open new schools whether they be actually new schools or the resumption of old schools previously handed over to a board, which would be technically reckoned as new schools. In the opinion of the committee, this is at present the only satisfactory solution of the religious difficulty—that is, to make religion one of the elements to be considered in deciding whether a school is necessary or unnecessary. There are some cases where the population is so small that this would not be possible. In such cases the religious difficulty might be entirely met by the school providing for all children who are not withdrawn, teaching such as a board school might give—Holy Scripture, the Creed, the Lord's Prayer and the Ten Commandments, and then, in addition, giving to those children who claimed it the fuller teaching of the entire Catechism. Lastly, whatever is done should be done so as to enable the schools in rural districts not only to provide better teachers, and pay them better, but also to improve their curricula and provide more opportunities for their scholars.

The protest of the Congregational Union against the positions here assumed was expressed in the following resolution:

That this assembly, feeling with ever-increasing force the importance of the education of the children of this country, and the need of watchful care, that the people from whose resources the cost of education is provided should have a powerful voice in the government of all schools aided by public grants; mindful also of the extent to which the children of nonconformists are forced to attend schools under clerical control, is strenuously opposed to the proposals of the archbishops and the Roman Catholic committees to seek increased grants of public funds for schools under denominational management, and for teachers whose appointment or dismissal would be vested in unrepresentative bodies. The assembly can not but regard these proposals as an attempt, under the guise of assistance to so-called voluntary schools, to create a fresh endowment of religious denominations by the state. It trusts that

all Congregationalists will present a united front in resisting such proposals and will maintain the principle that schools supported by the people must be governed by the people. The assembly further recommends the appointment of a national committee, including representative men of every denomination in England and Wales, to resist any further endowment of sectarian schools out of taxes or rates, and to demand the extension of school boards throughout the country, with large areas of administration, and providing unsectarian schools within reach of the population. And the assembly instructs the committee of the union to take immediate action for the formation of such a national committee.

The Baptist Union of Great Britain and Ireland and the Welsh Baptist Union were equally pronounced in their opposition.

At the Grindelwald conference on the reunion of Christendom, the Rev. Hugh Price Hughes created great excitement by a proposal which he termed a "concordat." It was as follows:

That the Church of England should make its day schools truly national schools, free from denominational bias, and that, on the other hand, nonconformists should sanction the teaching of the Apostles' Creed in all the schools of the country subject, of course, to a conscience clause.

Mr. Hughes added that he—

would further be prepared to support a proposal that all teachers that undertook religious teaching should be definitely trained in historical Christianity, by which he meant the Christianity of the Apostles' Creed. They must tell Unitarians, Atheists, Agnostics, Jews, Mohammedans, and Theosophists, and any others who objected to such a proposal that the majority of Englishmen desired their children to have a Christian education; that they were sufficiently protected by the conscience clause, and that they could not be permitted to interfere with a great national scheme of education.

No sooner was the "concordat" made public than it was repudiated on all sides by leading Methodists.

Dr. Rigg, in protesting against the Hughes "concordat," reiterates the resolution adopted by the Methodist Conference in 1891, which was as follows:

That the primary object of Methodist policy in the matter of elementary education is the establishment of school boards everywhere, acting in districts of sufficient areas, and the placing of a Christian nonsectarian school within reasonable distance of every family. This is of special importance in the rural districts, where our people have no alternative to the compulsory attendance of their children at Anglican schools.

The actual position of all nonconformists is plainly expressed by Dr. Parker, of London:

The only way out of the religious difficulty in rate-supported schools is to withdraw religion from the control of the state.

Outside of church orders the opposition to the increase of clerical power in elementary schools is organized for effective manifestation. Although the National Union of Teachers has proposed a compromise measure, the association is fully committed to the policy of public control where public funds are applied. Much more significant is the formation of the Birmingham Education League for the purpose of

resisting all proposals for increased aid from "public funds to schools under private denominational management, on the ground that they reopen the educational settlement of 1870, and tend to arrest the growth of an universal system of education under the local control of the elected representatives of the ratepayers."

The leader of the movement is Mr. George Dixon, chairman of the Birmingham school board, who achieved a national reputation as president of the National Education League. This league was founded prior to 1870, and contended in Parliament and out of Parliament for a complete system of public secular free schools as against the compromises actually adopted. From this same league, which was dissolved nearly twenty years ago, also emanated the scheme of Bible reading, without note or comment adopted by many school boards of England. The new association is not like the old league, a national organ, but its spirit is contagious, as is shown by the conference held in London soon after the Birmingham meeting, over which Mr. Dixon was invited to preside.

It may be supposed that in the face of such opposition the Conservative leaders will hesitate as to practical measures. The latest manifestation of the Government intentions was the speech of Lord Salisbury to the deputation headed by the archbishop of Canterbury, which sought audience in November to submit the memorial of the archbishop's committee.

In his address as reported in the *Standard* (London) Lord Salisbury said:

I am naturally come here rather to listen to the speeches, and much of what has been under discussion is matter of departmental detail, with which I am not qualified to deal. Of course, I can not tell you what the intentions of the Government are, because, in the first instance, as you know, the matter is still under consideration by the Government and we could not speak with any distinctness or certainty. But we are deeply sensible of the extreme importance of the question you have brought before us. The presence of such a deputation as this would be sufficient to impress the matter upon our minds; and the circumstance alluded to by Sir Edward Clarke, as to the strong feeling in the country, naturally ought to have effect in inducing us to consider the question with great care. We are in a position of very great difficulty, and I must say—although I may be in a minority in saying so—largely in consequence of the omissions and defects of the act of 1870. I quite concur with those who have said that from the principles and structure of that act we can not now depart; but that does not prevent us from saying that in consequence of the oversights committed at that time much of the difficulty has arisen. That act was passed in a moment of considerable mental excitement, and largely founded upon enthusiasm and panic. There was a great desire on the part of the education department to take advantage of a moment which they thought might never recur to pass a measure, and there was a very great apprehension on the part of the friends of the church that if they did not pass that bill they might get something worse. In consequence of these two feelings, at a time when Parliament was very much occupied, sufficient consideration was not given to all the difficulties that might arise. After our experience, two main difficulties present themselves—that is, two on principal points in the working of the act which have hitherto been held to be fundamental principles in English legislation and administration. The board

schools were set up to satisfy the crying need of supplying education where it did not exist. But the religious difficulty was, of course, very strongly felt. The answer was that there were voluntary schools beside the board schools, and that parents who did not like the education of the board schools would always have that resource. So long as the board schools did not act as an agency for exterminating voluntary schools, that answer was perfect and complete; but now you have compulsory education, so that every parent must send his child to school, and you have in operation machinery which seems destined at no very distant period to remove a great number of the schools where the parent has found the religious education he desires. Of course, since 1870 there has sprung up a sort of defense of the system under which we are now proceeding. We are assured that the board schools are really teaching the religion we ought to believe in. The Roman Catholics are not represented in this room, and do not appear to this memorial, but their feelings and desires in the matter will have to be considered, and they have always repudiated most indignantly the idea that the religion taught in the board schools is the religion which they recognize. The objection on the part of members of the Church of England is not so intense and not so universal, but still it is very strong indeed, and, so far as I am able to judge, it is growing, not weakening, both in area and in intensity.

The Nonconformists are well satisfied with the religious teaching in the board schools. I do not grudge them the advantages they have and desire, in obtaining at the public cost a system of religious teaching which is practically their own. I do not begrudge them, and I earnestly hope that they will always have that facility; but I desire that other religious bodies should have it, too. That is why, from the point of view of religious liberty, we desire, so far as we can do it, to assist the voluntary schools in their trouble and to take the stress off them under which they are now suffering. But there is another evil that was not foreseen when the act of 1870 was passed. That is, you have confided the spending of the ratepayers' money to a body which, by its constitution, has a great interest in the expenditure, but has very little interest in frugality. We do not have this in any other part of our system. It is quite true that the school boards are very earnest educationalists, and all the members of the boards, of course, are so. I admire the motives which induced them to spend so much money as they have spent, but of course those who have to furnish the money do not feel that admiration in an unqualified degree. Just apply that to some general department of expenditure with which we are not so familiar. We know that nothing can be more upright than the desires for expenditure which are entertained by the military offices. The military office wishes to make its institution as useful and valuable and extensive as possible. It has that desire constantly before its mind. Conceive, if there was no treasury to keep the war office from gratifying its desire to the utmost limit of its wishes; conceive, if there was no treasury to prevent the war office from drawing upon the taxpayers as largely as the head of the department could wish in order to make his department as perfect as possible! That is exactly what you are doing in the case of these school boards. I feel that some check is necessary, and I sympathize with those who look upon this matter from a religious standpoint. I look also with great sympathy on the subject from the ratepayers' point of view. I can not help thinking that there has been expenditure, both of a character and upon a class, which was not intended by those who originally passed the education act, and which would have been repudiated by many. Some check is necessary. I observe what the archbishop said in regard to the unanimity with which his friends had adopted the principal recommendations that have been put forward. There is a great deal to be said for them, and I will not say a word against them. They solve all these difficulties by assuming that the chancellor of the exchequer is the point of least resistance. The proposal is able and ingenious, and, like all ingenious and able proposals, it is exceedingly simple. Although I do not now express any opinion, I venture to warn his grace that the chancellor of the exchequer is the lion in the path. I earnestly hope his grace may be—I am sure he is—animated

by liberal and sympathetic feelings toward all the voluntary schools, and I hope that his feelings may be supported by the possession of unbounded means for carrying them out. But upon that subject I am of course wholly unable to speak. We must do what we can. What we can do, we must do quickly. We must not despair if we find that time is necessary in order to give us command of the sinews of war. I can only assure you that not only do I feel very strongly the claims of the voluntary schools, but they are felt by the whole party. Though I think that the unanimity which your grace alluded to gives value to the recommendations, still the great object you have in view is the great object not only of the church, but of the party now in the majority in the House of Commons. I can only assure you that our efforts will be directed to securing the best and most efficient means which the circumstances of the times will allow us to apply in order to remedy the grievances complained of.

The week following this important conference the premier received a second deputation on the same subject, namely, that of the Wesleyan Methodists.

Less imposing in its array of dignitaries than the Anglican deputation, it represented a political force not to be ignored.

That Lord Salisbury might be duly impressed with this fact, a few statistics relative to the denomination had been presented to him before the conference. These set forth that "the number of sittings provided in Wesleyan Methodist chapels in England and Wales is 2,146,000; the number of Sunday schools, 7,096; the number of Sunday scholars, 965,222; the number of day-school departments, 786; the number of scholars therein, 168,616." The memorial of the Wesleyans was long, but its position is summed up in a few words: "That there should be no increased grant of public funds, either from the local rates or from the imperial taxes, to denominational schools, unless that increased grant is accompanied by adequate and representative public management." As to the conscience clause which, it has been assumed, protects the religious scruples of parents, the following resolution was submitted:

The experience of twenty years has shown that the conscience clause has to a considerable extent proved to be ineffectual and unreal as a protection for parents and children against religious intolerance and oppression; that, moreover, in not a few day schools of the Church of England religious intolerance and bigotry of an exceedingly offensive character are systematically taught the scholars, during the hours set apart for religious instruction, by means of a special catechism, such as it ought not to be possible to teach in connection with any public school of the nation; and that the way of appeal to the education department against such grievances is difficult, tedious, and often altogether unavailable. This committee therefore would strongly urge upon the Government that the local education authority, which is responsible for enforcing educational compulsion on children and their parents, should have authority to take cognizance of any complaints which may be made by parents or guardians of offenses against conscience or religious liberty in the conduct of any inspected school, and may make representations on the subject either to the managers of the school or to the education department, or to both these authorities, as the case may require.

The same resolution was aimed also at the evil of unsanitary school premises, which is a standing cause of complaint in rural districts. The clause relating to this matter was as follows:

Further, it shall be within the competency of the same local authority to take cognizance of the sanitary conditions of the schools within their districts which it

may be their duty to require children to attend, and to make representations on this subject to the managers of any school or to the education department, or to both these authorities.

Recalling the watchword supplied by Mr. Balfour to the Church party, Rev. Hugh Price Hughes, in the course of the conference, set forth "the intolerable strain" which the Wesleyans bear. As reported by the *School Guardian*, he stated—

that there were at least 850,000 Wesleyan Methodist children in this country who were not in their own day schools, because they lived in localities where Wesleyan day schools did not exist. There were upward of 10,000 parishes, chiefly in the rural districts, where the only day school was the Anglican school, although, as had been stated, in some of these cases the children of Wesleyan Methodist parents were in a majority. In one district in Lincolnshire, for example, there were in a certain school 188 children, 49 of whom were Anglicans and 139 Methodists. That was by no means an exceptional case in that part of the country. Unhappily, in present circumstances, they were in the painful position that their children were by law compelled to go to schools where much was taught them to which their parents conscientiously objected. If the case were reversed and Churchmen were placed in such a position in relation, say, to the Baptists, he thought that Her Majesty's Government would soon find a remedy.

Lord Salisbury, in his reply, asserted that his remedy for the religious difficulty would be "simply the multiplication of denominational schools." He added further:

If I understand aright the position of a large number of people, it is that they energetically repudiate the idea that there is, in any sense of the word in which it has been used, a common ground of religious education by which only a portion of that religious education can be taken out and the rest given in its place. I am not asking whether they are right or wrong; but I again ask you to look at it from a political point of view—the view of the statesman or politician who wishes to know how the currents of opinion are trending—and I think you will find I am right in saying that the objection to leave out what Dr. Rigg would call the indifferent parts of Anglican teaching is very much more intense now than it was thirty years ago, and that the difficulty, therefore, of providing what is called unsectarian religion that shall be sufficient for all kinds of religious belief has increased enormously in recent years, and my impression is that it is going on increasing. The tendency of discussion must be to make it increase; and therefore I look with considerable doubt and apprehension at this idea, which I am afraid many of you possess, that it is possible to solve all our difficulties by forcing all children into one common school where they should be taught what may be called the residuum of religious education.

As to the resolution quoted above, he said:

May I say one word as to resolution No. 9, which, I confess, I read with sorrow? In that resolution the Wesleyan Conference says that "religious intolerance and bigotry of an exceedingly offensive character are systematically taught the scholars during the hours set apart for religious instruction by means of a special catechism." Now, I think that that statement ought to be reconsidered. If a Jew or a Roman Catholic insists upon teaching the religion which he believes, you only say that it is a legitimate and praiseworthy exercise of his just liberty; if a Scotch Presbyterian insists upon teaching the Westminster Confession you pass the same judgment upon him; but if a Church of England clergyman insists upon teaching what he believes, you denounce him as being guilty of religious intolerance and bigotry. I have no doubt that those observations were made in perfect sincerity and with the

highest motive, but on behalf of the Church of England I must say that I do not think that they are just, and I do not think that in the meeting of a week ago, to which allusion has been made, any such judgment on our Nonconformist brethren would have been passed.

In conclusion, the premier expressed the hope that—

we shall all earnestly try to keep them apart from political bias and do what we can to solve one of the most difficult problems which ever beset any community in a manner which shall be favorable, not only to the highest interests of education, but also to religion itself. (From report of the conference, in the *School Guardian*, November 30, 1895, pp. 943-944.)

All question as to the actual purposes of the Conservative government in respect to the pledges made to the advocates of clerical schools has been answered by the education bill, a copy of which has been received as this matter comes from press. The bill was presented by Sir John Gorst March 31, 1896, and carried through the second reading May 5 by a majority of 267. It is the first measure presented with any prospect of success since 1870 which advocates a distinct departure from the settlement effected by the education law of that year.

The radical changes in the existing system that it contemplates are comprised in the following proposals:

(1) For the creation of a new local educational authority by appointment of the county council, secondary and elementary education both to be included in its province; the same, however, to supplement not supersede such existing organizations for educational purposes as "supple efficient instruction."

(2) Transfer to the same of the routine work of the central education department, i. e., distribution of public grants for education, inspection of schools, etc., leaving the department to act as a court of appeal.

(3) Measures for preventing increase of school boards and absorbing those that exist.

(4) An extra parliamentary grant to be given alike to private (voluntary schools) and the poorer board schools at the rate of 4s. per capita of attendance.

(5) The abolition of the existing limit of the government grant to 17s. 6d. per capita of attendance.

(6) Exemption of school property from rating (local property tax).

(7) Introduction of sectarian instruction into public elementary schools.

The opposition to the bill is so intense and determined that in spite of the great majority which the government controls in the house it is likely to be modified in all essential particulars if not actually withdrawn.

## CHAPTER VII.

### MANITOBA SCHOOL CASE.

---

#### INTRODUCTORY STATEMENT.<sup>1</sup>

Through the courtesy of school officials in Canada this office is able to present a statement of the legal status of the Manitoba school case. The local conditions under which schools must be maintained, naturally, are not touched upon in that document; for a clearer understanding of the circumstances to which it pertains, these are here briefly considered.

In addition to the exigencies of a sparse and scattered population, and a severe winter climate, the peculiar character of the population must be taken into account. The census of 1891 showed 152,506 inhabitants in an area of 64,066 square miles, giving an average density of 2.4 a square mile. In the ten years 1881-1891, the population had increased by 145 per cent; 69 per cent of the population at the later date were natives of British America. Of the foreign born, the largest contingent were natives of Ireland.

Considered as to religion, Roman Catholics numbered 20,571, or 13½ per cent of the total population, and the Mennonites, a German sect who originally came to Canada from southern Russia, about two-thirds as many. Adherents of the Church of England formed 20 per cent of the population; Presbyterians, 25.5 per cent; Methodists, 18.5 per cent, and Baptists 10 per cent.

Rural life predominates, cities comprising less than one-fourth of the people (22.5 per cent). Winnipeg, the capital of the Province, had 25,642 inhabitants in 1891.

In spite of the many obstacles in the way, the increase of school facilities has been very marked. In the decade 1884-1894, while the school population increased by 195 per cent, the number of schools increased by 245 per cent, the teachers by 325 per cent, enrollment by 201 per cent, average attendance by 320 per cent, and the expenditure on public education by 113 per cent.

---

<sup>1</sup> Prepared by Miss Anna Tolman Smith.

The following tables from the Statistical Year Book of Canada for 1894 present the statistics of public schools for the successive years since the passage of the new school law (1890):

*Educational statistics of Manitoba.*

| Year.      | Number of schools. | Number of teachers. | School population (ages 5 to 16). | Number of pupils. | Average attendance. |
|------------|--------------------|---------------------|-----------------------------------|-------------------|---------------------|
| 1890 ..... | 627                | 840                 | 25, 077                           | 23, 256           | 11, 627             |
| 1891 ..... | 612                | 866                 | 28, 678                           | 23, 871           | 12, 433             |
| 1892 ..... | 660                | 902                 | 29, 564                           | 23, 244           | 12, 976             |
| 1893 ..... | 718                | 997                 | 34, 417                           | 28, 706           | 14, 180             |
| 1894 ..... | 884                | 1, 047              | 36, 459                           | 32, 680           | 16, 260             |

In 1894 there were 744 schoolhouses in the Province, of which 627 were frame, 37 brick, 11 stone, and 69 log. The number of trees planted was 2,223.

*Receipts and expenditures.*

| Year.      | Receipts.          |                |            | Expenditures.       |                            |                     |            |
|------------|--------------------|----------------|------------|---------------------|----------------------------|---------------------|------------|
|            | Government grants. | Municipal tax. | Total.     | Teachers' salaries. | Buildings, furniture, etc. | Fuel, repairs, etc. | Total.     |
| 1890 ..... | \$99, 258          | \$255, 089     | \$426, 705 | \$200, 929          | \$61, 036                  | \$29, 163           | \$388, 981 |
| 1891 ..... | 95, 307            | 312, 396       | 502, 640   | 251, 719            | 138, 403                   | 39, 911             | 457, 231   |
| 1892 ..... | 105, 575           | 262, 297       | 500, 227   | 291, 329            | 199, 637                   | 68, 957             | 636, 592   |
| 1893 ..... | 108, 072           | 329, 562       | 760, 583   | 317, 119            | 134, 590                   | 42, 757             | 744, 178   |
| 1894 ..... | 101, 013           | 354, 963       | 975, 156   | 359, 076            | 132, 932                   | 58, 794             | 774, 865   |

The amount of debenture indebtedness was \$655,723, and the value of the school sites, houses, and furniture was estimated at \$975,112.

The conditions under which the rapidly increasing schools are maintained are indeed unique. The Reverend Principal Grant, of Queen's College, Kingston, who has made many tours of the Province, the last in the fall of 1895, writes:

In not a few sections the winters are so severe that the schools are closed from December to April, and partly to make up for that there is no midsummer vacation.

In one township (an area of 8 or 10 square miles, with a population of from 3,000 to 6,000) he found but one school, "and therefore some of the scholars have to walk more than 3 miles to reach the school." He adds:

The whole number of scholars is 12 and the attendance is sometimes 2. When I visited it the other day 6 were present. The teacher seemed to me a governess instructing the children of one family, for the 6 were of different ages, and there were three or four reading classes.

The mixture of languages encountered almost everywhere reaches the extreme in Winnipeg. Writing from the capital, Principal Grant says:

I visited two representative schools the other day. The North Central, having eleven spacious class rooms crowded with 600 pupils, and beside it the modest little frame building called the School of the Immaculate Conception, in which the Sisters of Jesus and Mary teach 90 additional pupils—the one a public school, the other once public, but struck down by the act of 1890. In the little two-roomed school thirteen nationalities sit side by side—English (including Scotch, Irish, and Welsh), English-

Canadian, French-Canadian, Métis (half-breeds), Cree (an Indian tribe), German, Dutch, Swedish, Norwegian, Russian, Polish, Hungarian, and Syrian—all being ground up into Canadian. All are drilled in English up to the second reader, and after that point has been reached an hour and a quarter a day is given to drilling in French. In the big public school hard by, in addition to the thirteen nationalities mentioned, there are Jews, Icelanders, Finlanders, and negroes. In this school English is the sole language of instruction. Be it noted that there is not the slightest language or religious difficulty in either school, though religious exercises are held in both. The Sisters are excellent teachers in all the usual subjects.

In the public school every room is closed with the religious exercise prescribed by the advisory board—that is, the reading of a passage of Scripture and prayer. I asked the principal whether many of his 600 pupils retired before these exercises commenced. He seemed almost astonished at the question. “They never thought of such a thing.”

The necessity for making English the language of the schools and yet of preserving for the natives of French descent their mother tongue is readily recognized. Beyond this there is no special language problem. Of the Icelanders Principal Grant observes:

They have so little desire to preserve their own language in the new home which they have chosen that they prefer English to Icelandic teachers, even on their reserve at Gimli. Such an attitude shows their good sense, but it is to be remembered that they have no racial or religious difficulties worth speaking of to overcome. They are not part of a famous nation with a great literature; besides, they are Protestants, and without the extreme Puritanism and Quakerism of the Mennonites.

The difficulties of obtaining properly qualified teachers, which is experienced in all newly settled regions, is increased in Manitoba by several circumstances, among which the bilingual requirement is not the least.

The Mennonites [writes our author] need teachers able to converse and teach in German and English. The Métis and French-Canadians require teachers who can converse and teach in French and English. Bilingual readers are helpful, but in practice they amount to nothing unless the teachers can use both languages freely. This is Manitoba's crux.

\* \* \* \* \*

I may mention here that I visited one rural school in Manitoba, in an English-speaking Protestant district, where a genuine surprise and a rare pleasure awaited me. The teacher was aided in his work by an excellent wife, and, both being able to speak German fluently, they asked permission from the trustees to teach the scholars in both languages, assuring them that it would be to their advantage even in learning English. The district being near a Mennonite reserve, where it was apparent that a knowledge of German would be useful, the trustees and parents consented, and now all the children in that school are learning the two languages and finding the work a pleasure as well as a profit. I hope to see the day when we shall have hundreds of such teachers in our common schools. A supply of teachers of that kind would soon settle the real educational question of Manitoba, but they are not to be had unless special means are taken to get them; such means, for instance, as accepting university graduates for common schools, as they are accepted in Scotland; the employment of a teacher in the normal school whose sole business it would be to train candidates to teach in both languages, and the granting of a bonus or an addition to the salary of every teacher passing a satisfactory examination in both languages and thereafter obtaining a school in either a French or a German district.

Persistent efforts have been made to overcome these difficulties in the Mennonite districts by Rev. Mr. Ewert, a minister of the order who came from Kansas and was appointed special school inspector.

Mr. Ewert is employed by an association of religious, patriotic Mennonites to teach a kind of provisional normal school in Gretna, and from this school a gradually increasing supply of young Canadian Mennonite teachers will be obtained. Already it has sent out about a dozen, but Mr. Ewert frankly confesses that not one of them could get a third-class teachers' certificate. When his pupils are nearing that point they are eagerly sought for either by the private schools or by public-school trustees, and the youths can not resist the temptation of getting a salary and saving up money enough to enable them subsequently to attend his school without being an expense to their parents.

\* \* \* \* \*

It may be asked here why, seeing that the training of teachers is one of the functions of the Government, this association should have the burden laid on it of paying the only Mennonite normal-school teacher in the Province. The answer will be satisfactory to those who maintain that the state is an organism which must abstain from doing work necessary to its own well being rather than be unfaithful in any respect to a modern view of the relations of church and state. The Mennonites, whether public or private school supporters, insist that their teachers shall be trained in the Mennonite faith, so that they may be able to teach it to the children. The Government can not undertake to do that, and therefore would have to stand helplessly by and do nothing were it not for the voluntary Mennonite association, which benevolently has the same object in view—a supply of good teachers acceptable to the people. Mr. Ewert teaches not only the so-called secular branches, but also the Scriptures, and, being a duly ordained Mennonite minister, he has the confidence of that portion of them who are in favor of the public-school system, though he is regarded by many of the orthodox as a dangerous man, who is likely to lead their youth astray. Notwithstanding his being a suspect to this extent, the superiority of those trained by him over the old-fashioned teachers is so manifest that the managers of the private schools are engaging as many of them as they can get. It comes to this: That a little training is better than none, and that while what is practically a Mennonite church attends to that, the Government cooperates with it by paying half the salary of the teacher, paying him, however, not as a teacher, but as inspector of the Mennonite schools.

The Government has done much also to secure good teaching. A normal school is maintained at Winnipeg, and in 1894 there were also twelve provincial and local normal schools—or institutes, perhaps we should call them. These had 75 students in attendance at long sessions and 124 at short sessions.

The Government also pursues a liberal policy in respect to salaries. An annual grant of \$130 for each public-school teacher is made by the legislature, and from \$200 to \$400 from the municipality, to which the district may add as much as the trustees think proper to ask the council to assess.

In his final report embodying the results of his mission Principal Grant thus sums up his opinion on the question at issue between the provincial and the Dominion Government:

While the Province is morally bound to take action to meet the decision of the privy council and restore their educational rights to the Catholics, the Dominion Parliament should, nevertheless, not obtrude on the provincial domain, as provincial rights are the keystone of the constitution.

## THE PRESENT ISSUE.

By HENRY R. ALLEY, *Secretary to the Minister of Education for the Province of Ontario.*

By an act of the Imperial House of Commons known as the British North America act, 1867, the provinces of Upper Canada, Lower Canada, New Brunswick, and Nova Scotia, forming part of the British territories of North America, were federally united under the title of the "Dominion of Canada." Since the date of that act (1867) the Dominion has been enlarged easterly by the addition of Prince Edward Island, and westerly by the addition of British Columbia and the acquisition of the lands known as the Northwest Territories, and sometimes as the Hudson Bay Territories. These lands embrace all the country lying between the Rocky Mountains and the Lake of the Woods. Out of this territory, in 1870, the Province of Manitoba was laid out and given the same status as any other Province in the federal system of Canada.

By the act of confederation every Province was endowed with certain exclusive powers of self-government similar to the powers of sovereignty enjoyed by the States of the American Republic. In some other matters the power of the Central Government was supreme. Owing, however, to the contention between Protestants and Catholics for many years over the question of separate schools, the federal act, as will be seen more fully later on, authorized the Central Government to supersede, if need be, the legislation of any Province in matters of education. This power the Central Government could exercise in favor of either Catholics or Protestants, and was only to be invoked when it was clear that the interests of the minority of any Province were prejudicially affected in educational matters by local legislation. These powers are described in the confederation act as powers of "remedial legislation," and apply not only to the Provinces forming part of the original federation but to others subsequently added, so that when a Province established separate schools after it became part of the federation the Dominion Government would have the right to consider to what extent the powers conferred upon them could be interfered with by the subsequent legislation of the Province. The statutes bearing upon the question are as follows:

Section 93 of the British North America act, 1867, provides as follows:

In and for each Province the legislature may exclusively make laws in relation to education, subject and according to the following provisions:

(1) Nothing in any such law shall prejudicially affect any right or privilege with respect to denominational schools which any class of persons have by law in the Province of the Union.

(2) All the powers, privileges, and duties at the Union by law conferred and imposed in Upper Canada on the separate schools and school trustees of the Queen's

Roman Catholic subjects shall be, and the same are hereby, extended to the dissentient schools of the Queen's Protestant and Roman Catholic subjects in Quebec.

(3) Where in any Province a system of separate or dissentient schools exists by law at the Union, or is thereafter established by the legislature of the Province, an appeal shall lie to the Governor-General in council from any act or decision of any provincial authority affecting any right or privilege of the Protestant or Roman Catholic minority of the Queen's subjects in relation to education.

(4) In case any such provincial law, as from time to time seems to the Governor-General in council requisite for the due execution of the provisions of this section, is not made, or in case any decision of the Governor-General in council on any appeal under this section is not duly executed by the proper provincial authority in that behalf, then, and in every such case, and as far only as the circumstances of each case require, the Parliament of Canada may make remedial laws for the due execution of the provisions of this section, and of any decision of the Governor-General in council under this section.

Section 22 of the Manitoba act, 1870, provides as follows:

In and for the Province, the said legislature may exclusively make laws in relation to education, subject and according to the following provisions:

(1) Nothing in any such law shall prejudicially affect any right or privilege with respect to denominational schools which any class of persons have by law or practice in the Province at the Union.

(2) An appeal shall lie to the Governor-General in council from any act or decision of the legislature of the Province, or of any provincial authority, affecting any right or privilege of the Protestant or Roman Catholic minority of the Queen's subjects in relation to education.

(3) In case any such provincial law, as from time to time seems to the Governor-General in council requisite for the due execution of the provisions of this section, is not made, or in case any decision of the Governor-General in council on any appeal under this section is not duly executed by the proper provincial authority in that behalf, then, and in every such case, and as far only as the circumstances of each case require, the Parliament of Canada may make remedial laws for the due execution of the provisions of this section and of any decision of the Governor-General in council under this section.

It would appear, therefore, that the Manitoba act of 1870, like the act establishing confederation, intended to confer upon the minority the right to establish separate schools—that is, schools where religious instruction could be given to the pupils under such regulations as the government of the Province for the time being thought proper, the provisions of which may now be considered. For instance, the Manitoba school act of 1871 provided for a board of education of not less than ten nor more than fourteen members, of whom one-half were to be Protestants and the other half Catholics. The two sections of the board might meet at any time separately. Each section was to choose a chairman, and to have under its control and management the discipline of the schools of the section. One of the Protestant members was to be appointed superintendent of the Protestant schools, and one of the Catholic members superintendent of the Catholic schools, and these two were to be the joint secretaries of the board, which was to select the books to be used in the schools, except those having reference to religion or morals, which were to be prescribed by the sections respectively. The legislative grant for common-school education was to be

appropriated, one moiety to support the Protestant, the other moiety the Catholic schools. Certain districts in which the population was mainly Catholic were to be considered Catholic school districts, and certain other districts where the population was mainly Protestant were to be considered Protestant school districts. Every year a meeting of the male inhabitants of each district, summoned by the Superintendent of the section to which the district belonged, was to appoint trustees, and to decide whether their contributions to the support of the schools were to be raised by subscription, by a collection of a rate per scholar, or by assessment on the property of the district. They might also decide to erect a schoolhouse, and that the cost of it should be raised by assessment. In case the father or guardian of a school child was a Protestant in a Catholic district, or vice versa, he might send the child to the school of the nearest district of the other section, and in case he contributed to the school the child attended a sum equal to what he would have been bound to pay if he had belonged to that district, he was exempt from payment to the school of the district in which he lived.

Acts amending the education law in some respects were passed in subsequent years, but it is not necessary to refer to them, as in 1881 the act of 1871 and these amending acts were repealed. The Manitoba school act of 1881 followed the same general lines as that of 1871. The number of the board of education was fixed at not more than 21, of whom 12 were to be Protestants and 9 Catholics. If a less number were appointed the same relative proportion was to be observed. The board, as before, was to resolve itself into two sections, Protestant and Catholic, each of which was to have the control of the schools of its section, and all the books to be used in the schools under its control were now to be selected by each section. There were to be, as before, a Protestant and a Catholic superintendent. It was provided that the establishment of a school district of one denomination should not prevent the establishment of a school district of the other denomination in the same place, and that a Protestant and Catholic district might include the same territory in whole or in part. The sum appropriated by the legislature for common-school purposes was to be divided between the Protestant and Roman Catholic sections of the board in proportion to the number of children between the ages of 5 and 15 residing in the various Protestant and Roman Catholic school districts in the province where schools were in operation. With regard to local assessments for school purposes, it was provided that the ratepayers of a school district should pay their respective assessments to the schools of their respective denominations, and in no case was a Protestant ratepayer to be obliged to pay for a Catholic school or a Catholic ratepayer for a Protestant school.

The scheme embodied in this act was modified in some of its details by later acts of the legislature, but they did not affect in substance

the main features, to which attention has been called. While traces of the increase of the Protestant relatively to the Catholic population may be seen in the course which legislation took, the position of the Protestant and Catholic portions of the community in relation to education was not substantially altered, though the State aid, which at the outset was divided equally between them, had, of course, to be adjusted and made proportionate to the school population which each supplied.

Passing now to the department of education, we find that the public-schools act of 1890 wrought a great change. Under the former of these, Roman Catholics were not entitled as such to any representation on the board of education or on the advisory board, which was to authorize text-books for the use of pupils and to prescribe the form of religious exercises to be used in schools. All Protestant and Catholic school districts were to be subject to the provisions of the public-schools act. The public schools were to be free and entirely nonsectarian. No religious exercises were to be allowed unless conducted according to the regulations of the advisory board and with the authority of the school trustees for the district. It was made the duty of the trustees to take possession of all public-school property which had been acquired or given for public-school purposes in the district. The municipal council of every city, town, and village was directed to levy and collect upon the taxable property within the municipality such sums as might be required by the public-school trustees for school purposes. No municipal council was to have the right to exempt any property whatever from school taxation; and it was expressly enacted that any school not conducted according to all the provisions of the act or the regulations of the department of education or the advisory board should not be deemed a public school within the meaning of the law, and that such school should not participate in the legislative grant.

Memorials and petitions were presented to the Governor-General of Canada in council, and by many other Roman Catholic inhabitants of the Province, on behalf of the Roman Catholic minority of the Queen's subjects in the Province, by way of appeal from the two acts of Manitoba of 1890 before referred to, which petitions prayed as follows:

(1) That Your Excellency the Governor-General in council may entertain the said appeal, and may consider the same, and may make such provision and give such directions for the hearing and consideration of the said appeal as may be thought proper.

(2) That it may be declared that the said acts (53 Vic., chaps. 37, 38) do prejudicially affect the rights and privileges with regard to denominational schools which Roman Catholics had by law or practice in the Province at the Union.

(3) That it may be declared that the said last-mentioned acts do affect the rights and privileges of the Roman Catholic minority of the Queen's subjects in relation to education.

(4) That it may be declared that to Your Excellency the Governor-General in council it seems requisite that the provisions of the statutes in force in the Province of Manitoba prior to the passage of the said acts should be reenacted in so far at least

as may be necessary to secure to the Roman Catholics in the said Province the right to build, maintain, equip, manage, conduct, and support these schools in the manner provided for by the said statutes, to secure to them their proportionate share of any grant made out of the public funds for the purposes of education, and to relieve such members of the Roman Catholic Church as contribute to such Roman Catholic schools from all payment or contribution to the support of any other schools, or that the said acts of 1890 should be so modified or amended as to effect such purposes.

(5) And that such further or other declaration or order may be made as to Your Excellency the Governor-General in council shall, under the circumstances, seem proper, and that such directions may be given, provisions made, and all things done in the premises for the purpose of affording relief to the said Roman Catholic minority in the said Province as to your excellency in council may seem meet.

The case then was referred to the supreme court of Canada, by which case various questions were submitted for the opinion of the court. These were as follows:

(1) Is the appeal referred to in the said memorials and petitions, and asserted thereby, such an appeal as is admissible by subsection 3 of section 93 of the British North America act, 1867, or by subsection 2 of section 22 of the Manitoba act (33 Vic. (1870), chap. 3, Canada)?

(2) Are the grounds set forth in the petitions and memorials such as may be the subject of appeal under the authority of the subsections above referred to, or either of them?

(3) Does the decision of the judicial committee of the privy council in the cases of *Barrett v. The City of Winnipeg* and *Logan v. The City of Winnipeg* dispose of or conclude the application for redress based on the contention that the rights of the Roman Catholic minority which accrued to them after the Union under the statutes of the Province have been interfered with by the two statutes of 1890, complained of in the said petitions and memorials.

(4) Does subsection 3 of section 93 of the British North America act 1867, apply to Manitoba?

(5) Has his excellency the Governor-General in council power to make the declarations or remedial orders which are asked for in the said memorials and petitions, assuming the material facts to be as stated therein, or has his excellency the Governor-General in council any other jurisdiction in the premises?

(6) Did the acts of Manitoba relating to education, passed prior to the session of 1890, confer on or continue to the minority a right or privilege in relation to education within the meaning of subsection 2 of section 22 of the Manitoba act, or establish a system of separate or dissentient schools within the meaning of subsection 3 of section 93 of the British North America act, 1867, if said section 93 be found to be applicable to Manitoba; and if so, did the two acts of 1890 complained of, or either of them, affect any right or privilege of the minority in such a manner that an appeal will lie thereunder to the Governor-General in council.

In regard to this question the supreme court were divided, three of the judges out of the five giving a negative answer to all the questions. The Roman Catholics then appealed to the judicial committee of the privy council, the highest court in the British Empire, against the supreme court of Canada, and, after argument before the privy council, judgment was given in January last to the effect that the Governor-General in council had jurisdiction to make remedial orders or declarations, and that the appeal was well founded. The privy council further stated that it was not essential that the statutes of Manitoba repealed by the act of 1890 should be reenacted, or that the precise provisions of

these acts should again be made law; or, in other words, the privy council said that it was not absolutely necessary to restore the separate-school system which was abolished by the public-schools act of 1890, in the form in which it previously existed, but that the system of 1890 might be supplemented by provisions which would remove the grievance of which the Roman Catholics complained.

On the receipt of the judgment of the privy council the Governor-General of Canada, on the advice of his council, passed a remedial order, which sets forth that it seems requisite that the system of education embodied in the two acts of 1890 should be supplemented by a provincial act or acts which would restore to the Roman Catholic minority the rights and privileges of which they were deprived by the act of 1890 so far, and so far only, as may be necessary to enable them (a) to build, maintain, equip, manage, conduct, and support Roman Catholic schools in the manner provided for by the said statutes which were repealed by the two acts of 1890; (b) the right to share proportionately in any grant made out of the public funds for the purposes of education; (c) the right of exemption of the supporters of such Roman Catholic schools from all payment or contribution to the support of any other schools.

The following is the text of the remedial order of the government of the Dominion of Canada. As this document is of considerable importance, I quote it in full:

Whereas on the 26th day of November, 1892, a petition by way of appeal, under the provisions of section 22 of chapter 3 of the acts of the Parliament of Canada, passed in the thirty-third year of Her Majesty's reign, and entitled an act to amend and continue the act 32-33 Victoria, chapter 3, and to establish and provide for the government of the Province of Manitoba (commonly called the Manitoba act), and confirmed by "The British North America act, 1871," was presented to his excellency the Governor-General of Canada, by and on behalf of the Roman Catholic minority of Her Majesty's subjects in the Province of Manitoba, which petition, among other things, alleged in effect that by certain acts of the legislature of the Province of Manitoba passed after the Union and by an act passed by the said legislature in the forty-fourth year of Her Majesty's reign, chapter 4, which may be cited as "The Manitoba school act," and by the acts amending the same, the Roman Catholic minority of Her Majesty's subjects in Manitoba acquired the rights and privileges in relation to education thereby conferred upon them, including the right to build, maintain, equip, manage, conduct, and support Roman Catholic schools in a manner provided by the said statutes, the right to a proportionate share of any grant made out of the public funds for the purposes of education and the right of exemption of such members of the Roman Catholic Church as contribute to such Roman Catholic schools from all payments or contributions to the support of any other schools.

That subsequently, in the fifty-third year of Her Majesty's reign, two statutes were passed by the legislature of the Province of Manitoba relating to education, which statutes came into force on the 1st day of May, 1890, and are entitled, respectively, "An act respecting the department of education" and "An act respecting public schools," and that the effect of the two last-mentioned statutes was to repeal the previous acts of the Province of Manitoba in relation to education, and to deprive the Roman Catholic minority of the rights and privileges which it had acquired under such previous statutes, and by the said petition the said Roman

Catholic minority prayed, among other things, that it might be declared that the said last-mentioned acts did affect the rights and privileges of the said Roman Catholic minority of the Queen's subjects in relation to education.

That it might be declared that to his excellency the Governor-General in council it seems requisite that the provisions of the statutes in force in the Province of Manitoba, prior to the passage of the said acts, should be reenacted in so far at least as may be necessary to secure to the Roman Catholics in the said Province the right to build, maintain, equip, manage, conduct, and support their schools in the manner provided for by the said statutes, to secure to them their proportionate share of any grant made out of the public funds for the purposes of education, and to relieve such members of the Roman Catholic Church as contribute to such Roman Catholic schools from all payment or contribution to the support of any other schools, or that the said acts of 1890 should be so modified or amended as to effect such purposes.

And that such further or other declaration or order might be made as to his excellency the Governor-General in council should under the circumstances seem proper, and that such directions might be given, provisions made, and all things done in the premises for the purpose of affording relief to the said Roman Catholic minority in the said Province, as to his excellency in council might seem meet. And

Whereas the 26th day of February, 1895, having been appointed for the hearing of the said appeal, and the same coming on to be heard on that day, and on the 5th, 6th, and 7th days of March, 1895, in the presence of counsel for the petitioners (the said Roman Catholic minority of Her Majesty's subjects in the Province of Manitoba) and as well for the Province of Manitoba, upon reading the said petition and the statutes therein referred to, and upon hearing what was alleged by counsel on both sides, his excellency the Governor-General in council was pleased to order and adjudge, and it is hereby ordered and adjudged, that the said appeal be and the same is hereby allowed in so far as it relates to rights acquired by the said Roman Catholic minority under legislation of the Province of Manitoba, passed subsequent to the Union of that Province with the Dominion of Canada, and his excellency the Governor-General in council was pleased to adjudge and declare, and it is hereby adjudged and declared, that by the two acts passed by the legislature of the Province of Manitoba, on the 1st day of May, 1890, entitled respectively "An act respecting the department of education," and "An act respecting public schools," the rights and privileges of the Roman Catholic minority of the said Province in relation to education prior to the 1st day of May, 1890, have been affected by depriving the Roman Catholic minority of the following rights and privileges, which previous to and until the 1st day of May, 1890, such minority had, viz:

(a) The right to build, maintain, equip, manage, conduct, and support Roman Catholic schools in the manner provided for by the said statutes, which were repealed by the two acts of 1890 aforesaid.

(b) The right to share proportionately in any grant made out of the public funds for the purposes of education.

(c) The right of exemption of such Roman Catholics as contribute to Roman Catholic schools from all payment or contribution to the support of any other schools.

And his excellency the Governor-General in council was further pleased to declare and decide, and it is hereby declared, that it seems requisite that the system of education embodied in the two acts of 1890, aforesaid, shall be supplemented by a provincial act or acts which will restore to the Roman Catholic minority the said rights and privileges of which such minority has been deprived as aforesaid, and which will modify the said acts of 1890 so far, and so far only, as may be necessary to give effect to the provisions restoring the rights and privileges in paragraphs (a), (b), and (c) hereinbefore mentioned.

Whereof the lieutenant-governor of the Province of Manitoba for the time being, and the legislature of the said province, and all persons whom it may concern, are to take notice and govern themselves accordingly.

The legislature of Manitoba met on the 14th of June, 1895, and after a full discussion of the remedial order the following reply to the Dominion Government was adopted on the 19th of June:

The privileges which by the said order we are commanded to restore to our Roman Catholic citizens are substantially the same privileges which they enjoyed previously to the year 1890. Compliance with the terms of the order would restore Catholic separate schools with no more satisfactory guaranties for their efficiency than existed prior to the said date.

The educational policy embodied in our present statutes was adopted after an examination of the results of the policy theretofore followed under which the separate Roman Catholic schools (now sought to be restored) had existed for a period of upward of nineteen years. The said schools were found to be inefficient. As conducted under the Roman Catholic section of the board of education they did not possess the attributes of efficient modern public schools.

Their conduct, management, and regulation were defective; as a result of leaving a large section of the population with no better means of education than was thus supplied, many people grew up in a state of illiteracy. So far as we are aware there has never been an attempt made to defend these schools on their merits, and we do not know of any ground upon which the expenditure of public money in their support could be justified.

We are therefore compelled to respectfully state to your excellency in council that we can not accept the responsibility of carrying into effect the terms of the remedial order.

Objections upon principle may be taken to any modification of our educational statutes which would result in the establishment of one or more sets of separate schools. Apart, however, from the objections upon principle, there are serious objections from a practical educational standpoint. Some of these objections may be briefly indicated:

We labor under great difficulties in maintaining an efficient system of primary education. The school taxes bear heavily upon our people. The large amount of land which is free from school taxes, and the great extent of country over which our small population is scattered, present obstacles to efficiency and progress.

The reforms effected in 1890 have given a strong impetus to educational work, but the difficulties which are inherent in our circumstances have constantly to be met. It will be obvious that the establishment of a set of Roman Catholic schools, followed by a set of Anglican schools and possibly Mennonite, Icelandic, and other schools, would so impair our present system that any approach to even our present general standard of efficiency would be quite impossible. We contemplate the inauguration of such a state of affairs with very grave apprehension. We have no hesitation in saying that there can not be suggested any measure which to our minds would more seriously imperil the development of our Province.

We believe that when the remedial order was made there was not then available to your excellency in council full and accurate information as to the working of our former system of schools.

We also believe that there was lacking the means of forming a correct judgment as to the effect upon the Province of changes in the direction indicated in the order.

Being impressed with this view, we respectfully admit that it is not yet too late to make a full and deliberate investigation of the whole subject. Should such a course be adopted, we shall cheerfully assist in affording the most complete information available. An investigation of such a kind would furnish a substantial basis of fact upon which conclusions could be formed with a reasonable degree of certainty.

It is urged most strongly that upon so important a matter, involving as it does the religious feelings and convictions of different classes of the people of Canada, and the educational interests of a Province which is expected to become one of the

most important in the Dominion, no hasty action should be taken, but that, on the contrary the greatest care and deliberation should be exercised, and a full and thorough investigation made.

While we do not think it proper to enter upon a legal argument in this memorial, we deem it our duty to briefly call attention to some of the legal and constitutional difficulties which surround the case. It is held by some authorities that any action taken by the Parliament of Canada upon the subject will be irrevocable. While this opinion may or may not be held to be sound, it is, in our judgment, only necessary to point out that there are substantial grounds for entertaining such an opinion, in order to emphasize the necessity for acquiring a most ample knowledge of the facts before any suggestion of parliamentary action is made.

It will be admitted that the two essentials of any effective and substantial restoration of Roman Catholic privileges are—

(1) The right to levy taxes.

(2) The right to participate in the legislative school grant.

Without these privileges the separate schools can not be properly carried on, and without them, therefore, any professed restoration of privileges would be illusory.

It may be held that the power to collect taxes for school purposes conferred upon school boards by our former educational statutes was conferred by virtue of the provisions of subsection 2 of section 92 of the British North America act and not by virtue of the provisions of section 22 of the Manitoba act. If this view be well founded, then that portion of the act of 1890 which abolished the said right to collect taxes is not subject to appeal to your excellency in council, and the remedial order and any subsequent legislative act of the Parliament of Canada (in so far as they may purport to restore the said right) will be *ultra vires*.

As to the legislative grant, we hold that it is entirely within the control of the legislature of the Province, and that no part of the public funds of the Province could be made available for the support of separate schools without the voluntary action of the legislature. It would appear, therefore, that any action of the Parliament of Canada looking to the restoration of Roman Catholic privileges must, to be of real and substantial benefit, be supplemented by the voluntary action of the provincial legislature.

If this be the case, nothing could be more unfortunate, from the standpoint of the Roman Catholic people themselves, than any hasty or peremptory action on the part of the Parliament of Canada, because such action would probably produce strained relations and tend to prevent the possibility of restoring harmony.

We respectfully suggest to your excellency in council that all of the above considerations call most strongly for full and careful deliberation, and for such a course of action as will avoid irritating complications.

We deem it proper, also, to call attention to the fact that it is only a few months since the latest decision upon the subject was given by the judicial committee of the privy council. Previous to that time a majority of the members of the legislative assembly of Manitoba had expressly or impliedly given pledges to their constituents which they feel in honor bound loyally to fulfill.

We understand that it has been lately suggested that private funds of the Roman Catholic Church and people had been invested in school buildings and land that are now appropriated for public-school purposes. No evidence of such fact has ever been laid before us, so far as we can ascertain, but we profess ourselves willing, if any such injustice can be established, to make full and fair compensation therefor.

Owing to the differences of opinion among the members of the Government of the Dominion of Canada as to what course was best to pursue, the House of Commons adjourned until the month of January, 1896, with a view to take such action as may seem proper after having taken time fully to consider the question in all its bearings.

The following events, which have occurred since the foregoing account was written, bring the history of this case to date:

On December 23, 1895, Premier Greenway announced that the people of Manitoba should have an opportunity at a general election to express their sentiments on the school issue. Accordingly, the provincial legislature on the 26th of December approved an answer to the Dominion Government definitely rejecting the Dominion's request that Manitoba should enact a remedial law. The Manitoba legislature was thereupon dissolved, and the appeal was taken directly to the people. The election was held on the 15th of January, and it resulted in an overwhelming triumph for Mr. Greenway and his policy of nonsectarian schools.

The Dominion Parliament assembled January 2, on which day Lord Aberdeen, as Governor-General, had presented his address to the lawmakers, and had strongly urged the necessity of compelling Manitoba to submit. It turned out that the Dominion cabinet was seriously divided on the subject, and on January 4 half of the ministers resigned their portfolios. For a few days it seemed probable that Sir Mackenzie Bowell would be unable to reorganize the cabinet and would have to resign his position as prime minister. Sir Charles Tupper, sr., was slated as Mr. Bowell's successor. Largely, however, through the efforts of Lord Aberdeen and of Mr. Joseph Chamberlain, in his capacity as British colonial secretary, the cabinet breach was mended, the retiring ministers were induced to withdraw their resignations, a place in the cabinet was found for Sir Charles Tupper, sr., and Sir Mackenzie Bowell remains at the helm. It is difficult to see what solution can be found for the deadlock. (*Review of Reviews*, February 1896, p. 147.)

## CHAPTER VIII.

### EDUCATION IN FRANCE.<sup>1</sup>

---

*France, Republic.*—Area, 204,092 square miles. Population (actual), April 12, 1891, 38,095,156; domiciled or legal, 38,343,193.

*Civil divisions.*—For purposes of civil government, France is divided into 86 departments (90, if Algiers be included), each having its local legislative assembly formed by election. The departments are subdivided into arrondissements and these into cantons. The smallest civil divisions comprised within the cantons are communes.

Education in France: Outline view, with current statistics; inspection of infant schools; recent changes in the baccalaureate; reorganization of medical studies, and of the scientific course preparatory thereto. (Report, 1892-93, Vol. I, pp. 219-237.)

*TOPICAL OUTLINE.*—*General features of the system, with current statistics—Recent modifications in the department of secondary instruction—Recent development of the faculties—Correlation of courses—Higher education of women—Progress of the primary school system as shown by successive laws and statistics—Movements for promoting the instruction of adults—Movement for admitting American students as candidates for degrees in the universities of France.*

#### GENERAL FEATURES OF THE EDUCATIONAL SYSTEM.

The system of education maintained by the French Republic preserves many of the administrative features of the Imperial University. The official head of the system is a cabinet officer, the minister of public instruction, fine arts, and worship.<sup>2</sup> His authority is modified by the

---

<sup>1</sup> Prepared by Miss Anna Tolman Smith.

<sup>2</sup> M. Leygues was appointed to the office June, 1894, and was succeeded January 26, 1895, by M. Poincaré, who, in turn, was succeeded November 1, of the same year, by M. Combes.

advice of professional experts, constituting the superior council of public instruction. A tendency toward decentralization is at present manifest throughout the system.

Administration is facilitated by the subdivisions of the system.

On the basis of scholastic grade it is divided into three great departments—primary, which includes infant schools (ages, 2 to 6), primary schools (elementary and superior, ages 6 to 13), adult schools, and normal schools for primary teachers; secondary, to which belong the lycées (State classical colleges) and communal colleges; superior, which comprises special schools<sup>1</sup> and the faculties for liberal education and professional training, at present 59 in number.

Each of the three departments has its own chief or director,<sup>2</sup> its separate budget and distinct body of laws, decrees, etc.

Local divisions result from the organization of the universities (faculties), colleges, and schools comprised in the system into academic groups (17 in number) each under its own chief or rector.

The enrollment in the several classes of institutions for the latest years reported were as follows: 1891-92, infant schools, 679,579; primary schools, 5,556,470. Lycées and communal colleges for boys, public, 85,291; private, 89,566; for girls, public secondary, 11,605. University faculties (1893), public, 23,397 students; private, 988.

The obligatory expenses of the service are covered substantially by an annual appropriation from the State, amounting in 1893 to \$33,699,943; of this amount 77.8 per cent was for primary instruction. The total expenditures for this department amounted in 1892 to \$37,261,215. This includes, besides the obligatory expenses of the primary schools, i. e., \$29,768,033, the optional expenditures, costs of local inspection, and the expenditure for departmental normal schools.

The scholastic work of all public establishments is regulated by law or by official decrees that embody the matured opinions of the superior council of education, a representative body of 60 members, three-fourths of whom are elected by their peers from the various orders of public instruction, the remainder being appointed by the President. The council is not only an advisory, but also a judicial body, being the final court of appeal in certain cases of contention; as, for example, cases of the removal of teachers by local authorities. Paris is the seat of the council, whose deliberations are presided over by the minister. The academic rectors have the advice of academic councils composed of

<sup>1</sup> The special schools which are under the exclusive control of the minister of public instruction and fine arts are the Collège de France, Muséum d'Histoire Naturelle, École Normale Supérieure, École Française de Rome, École Française d'Athènes, École Nationale des Chartes, École Spéciale des Langues Orientales Vivantes, École Nationale et Spéciale des Beaux Arts à Paris, Conservatoire National de Musique et de Déclamation.

<sup>2</sup> The present incumbents are: M. Louis Liard, superior; M. Rabier, secondary; M. F. Buisson, primary.

"inspecteurs d'académies," professors, and teachers; finally, the prefects are assisted by departmental councils. These several councils save the work of public education, to some degree at least, from the mechanical routine which is one danger of a centralized system.

All appointments to the service, whether official or professional, are made either by the minister or by the President of the Republic, excepting only those of elementary teachers. They are appointed by the heads of departments (prefects, themselves appointed by the President). The officers of administration form an educational hierarchy whose successive stages are open only to candidates who pass examinations and secure the required diplomas or degrees. Promotions are generally the reward of distinguished service or the recognition of superior merit. Officials, professors, and teachers all receive their salaries from the State.

Secondary and superior institutions have more immediate relation with the central administration than primary schools.

#### RECENT MODIFICATIONS IN THE DEPARTMENT OF SECONDARY INSTRUCTION.

The most important recent measures affecting secondary institutions are the decrees of August 8, 1890, and of June 4, 1891 (discussed in full in the Commissioners' report for 1890-91). The decree of August 8, an outcome of efforts begun in 1872 by Jules Simon, at that time minister of public instruction, reorganizes the classical course of the lycée. The trifurcation, which formerly took place after troisième, i. e., the sixth year of the lycée course, is abolished, and a single degree of bachelor is substituted for the three orders previously existing. All students must now pursue the same course to the end of rhetoric, or the eighth year, when the first examination for the bachelor's degree takes place. In the remaining year (philosophy) options are allowed, and according to the choice then made he who successfully passes the final examination will have his diploma inscribed, "Lettres, philosophie," "Lettres, mathématiques," or "Lettres, sciences physiques et naturelles." The measures which have thus simplified the plan of studies aimed also at readjustments which should give the natural sciences equal recognition with the classics. The failure of this effort shows the inherent tenacity of the traditional course. Latin and Greek, which declined slightly in 1880 in favor of history, geography, and science, have since gained increased time. The efforts to relax the rigid uniformity of the lycée programmes and the mechanical routine of student life have been more successful. Opportunity is now given the principals (provisours) to develop individual characteristics in their respective lycées.

The decree of June 4, 1891, relates to the nonclassical course of the lycées. The name of this course is changed from "enseignement secondaire spécial" to "enseignement secondaire moderne." In the read-

justment of the studies the technical or commercial character has given way to the educative. The claim is made that the course, "although modern is classic." This claim is based upon the proposed method of treating the modern languages and literature, especially French. On the grammatical side the historical development of the language is to be considered, while the study of the several literatures is to be made wholly from authors of the highest order.

The most original feature of the course is the expedient for placing minds on the historic plane. This is to be done by interpretations of the master works of antiquity, based upon translations. The interpretations are to be presented by professors thoroughly acquainted with the original, and able, if need be, to translate as they interpret. Thus, while modern languages and literature are the center of the programme, they will not be wholly detached from historic relations.

Students who complete the course receive a diploma "*baccalauréat de l'enseignement secondaire moderne*" upon the successful passing of two examinations at an interval of three months. The second of these examinations is divided into three orders, between which the candidate may choose. According to the choice, his diploma is inscribed, "*Lettres, philosophie*," "*Lettres, sciences*," or "*Lettres, mathématiques*."

#### RECENT DEVELOPMENT OF THE FACULTIES (UNIVERSITIES).

The faculties are institutions of superior instruction corresponding to the universities of other countries. They comprise groups of professors, whose function it is to maintain courses of advanced instruction and to examine for and confer degrees. From their organization by Napoleon until a very recent date it was the latter service that gave dignity and importance to these bodies. The development of teaching functions and of autonomous powers are features of their later history.

By a decree of 1885, authorizing them to receive, hold, and administer property, civic personality was conferred upon the faculties, and the work of organization was begun by the creation of a council-general of all the faculties (*conseil général des facultés*) of an academic district and a general assembly and a council of each individual faculty. The council-general consists of the deans of the faculties, together with two representatives from each faculty, chosen by their colleagues. It is presided over by the academic rector. This body regulates scholastic affairs of general interest to all the faculties represented therein, and has control of their finances. The general assembly of each faculty, which comprises all the members of the same, arranges the details of the courses of instruction. The council, which comprises only titular professors and "*professeurs adjoints*," receives gifts and legacies on behalf of the faculty and distributes its revenues. This council also has a voice in the choice of professors, appointments to the respective faculties being made by the President of the Republic from two lists, one submitted by the faculty council, the other by the superior council

of public instruction. The movement for reorganizing the faculties has culminated in a measure for transforming them into independent universities, a bill to that effect being now before the French Chambers.

Meanwhile, efforts for the extension of the powers and scope of the several faculties are constantly in progress. The decrees of July 31, 1893, pertaining to the medical course were discussed in the Commissioner's preceding report. They require students to obtain a special certificate of physical, chemical, and natural sciences in addition to the bachelor's degree before entering upon a medical course. Provision for special scientific instruction leading to the certificate is to be made in the faculties of sciences, which thus derive new importance in the scheme of university work.

The faculties of law have been the subject of revision during the present year. By a decree dated April 8, 1895, the doctorate of law was established in two forms, i. e., the doctorate of legal science and the doctorate of political and economic science. This is the successful termination of efforts reaching as far back as 1789 to secure state recognition and support for studies that pertain essentially to the conditions of modern society. The decree also permits elective courses to a limited extent. The student of legal science, in preparing for his final examination, beside the required subjects in civil law, may make choice between criminal law, administrative law, and international public law. The student of political and economic science may, in like manner, choose between industrial legislation, rural legislation, and colonial legislation, or an equivalent course in history or economics given in another faculty.

The standard of legal instruction, which has always been high, is in no wise lowered by the changes. Students must, as before, secure the bachelor's diploma in the classical course before entering upon their legal studies. The legal course itself is arranged still for four years—i. e., one for the baccalaureate, two for the licencié, and one for the doctorate. The actual duration of the studies is generally five years.

*Correlation of courses.*—The courses of study for secondary and superior institutions are elaborated in the superior council, due consideration being given to the opinions of the several faculties which are formally submitted by the academic rectors. These courses form a continuous scheme of study, starting at an elementary stage (i. e., for pupils 8 years of age) and comprising the entire province of general and special knowledge.

The ideal of unity which is typified in the administrative service of the system of education finds higher realization in the correlation of the courses of study. Students of liberal and professional education are drawn chiefly from the higher classes of society; nevertheless these courses have been brought within the reach of the common people since the lycées have been affiliated on one side (i. e., enseignement

secondaire moderne) to the primary schools. This provision, moreover, has been made available by public scholarships open to competitive examination.

The course of the lycées leads to the bachelor's degree, which is the first of the series of university degrees, i. e., bachelor, licencié, and doctor. Candidates for degrees must be inscribed in the faculty corresponding to the degree sought, pay the required fees, and sustain the examinations. Only those who take inscriptions, as it is called, are classed as students. In addition, large companies of hearers attend the lectures of the professors. Candidates for degrees may pursue their studies either under the faculties, in special schools, or under private tuition.

The bachelor's degree stamps one as a man of liberal culture; it is moreover, a necessary prerequisite to the higher degrees (licencié and doctor), which are the passports to professional and official careers.

*Higher education for women.*—It should be noted that women are admitted to the privileges and honors of the higher courses.

From 1875-76 to 1887-88, inclusive, university degrees to the number of 262 were granted to women. These included 39 in medicine, 130 in the sciences, 89 in classics and belles-lettres, 1 in pharmacy, and 3 in law. Of the whole number, 137 were obtained in Paris and the remainder in the provinces; 207 were conferred upon French women. Women pursue degree courses in the state faculties or under private auspices. They form also a large proportion of the auditors at the public lectures of the faculty professors and of the Collège de France.

#### PROGRESS OF THE SYSTEM OF PRIMARY EDUCATION.

The series of official reports (statistiques) relating to primary education shows very clearly the development of the department since the passage of Guizot's law of 1833. This early measure, to whose support Louis Philippe was won by the zeal of its author, has been the basis of all subsequent legislation on the subject.

By placing upon the commune the obligation to maintain at least one public school and to provide for the free tuition of indigent children, the law assured the permanence and extension of the system.

The dignity of the teaching profession was asserted by the clause of the law requiring from teachers guaranties both of their moral character and professional training (i. e., "brevet de capacité") and by the provision of normal schools to be maintained at the expense of the departments.

Upon these lines the system of public instruction has been extended by the Republic, while at the same time the central control has been greatly strengthened.

The first measure of the present Government relative to primary instruction was the law of June 1, 1878, which placed about \$24,000,000 at the disposition of the minister of public instruction for the purpose

of aiding the communes in erecting schoolhouses. One-half the sum formed a gratuitous subvention to the communes; the other half was to be used as a loan, payable in small annual installments, thirty-one years being allowed to meet the indebtedness. The policy was renewed by successive laws until 1885, when the gratuities were discontinued, but provision was still made for loans to needy communes upon terms precisely defined.

From a special inquiry instituted before the law was framed it appeared that about 17,300 new buildings must be erected, about 3,000 bought, and 13,000 enlarged or repaired if all the children of school age in the 36,000 communes were to be provided for.

In the decade 1873 to 1888 11,632 school buildings were built or purchased, and at the present time school provision is substantially complete.

In 1879 a law was passed requiring each department to maintain a normal school for women in addition to the school for men, provided under the law of 1833. This provision has been complied with by 85 out of 90 departments. The law of June 16, 1881, obliging all teachers to secure a State diploma (*titre de capacité*), completed the measures for insuring professional qualification in the teaching service. A second law, bearing the same date, June 16, 1881, abolished school fees and made instruction gratuitous. The year following, March 28, 1882, the law was passed making the schools secular and obliging parents to secure the instruction of their children. Finally, the law of October 30, 1886, determined the classification of schools and the subjects of instruction, defined exactly the qualifications for teachers, confirmed the secular character of the schools by forbidding the employment of teachers belonging to a religious order, placed the schools under the inspection of (1) local officials—the communal mayor and committees and members of the departmental council delegated for the purpose—(2) under a graded series of Government officials—inspectors of primary schools, the academic inspectors, and the inspectors-general.

The delegates appointed by the departmental councils confer with the communal authorities and with the primary inspectors as to sites, buildings, material, etc. The mayors of communes have free access to the schools at all times; their duties and those of the delegates are much like those of our district-school committees, excepting that they have no control over teachers or programmes. It is incumbent also upon communes to maintain funds (*caisses des écoles*) for the assistance of indigent pupils. The law of March 28, 1882, obliges parents to secure the instruction of their children; they can, however, make choice of the means—either in public schools, private schools, or by home tuition.

## SUBJECTS AND COURSES OF INSTRUCTION.

The subjects of instruction for primary schools, as fixed by the law of March 28, 1882, comprise moral and civic instruction, reading, writing, the elements of arithmetic and the metric system; history and geography, especially of France; object lessons, and the first notions of science; elements of design, of singing, manual work (needlework in the schools for girls), gymnastic exercises, and in the schools for boys military drill.

In the superior primary schools, which in 1891-92 were attended by 45,599 pupils, these branches of instruction are reviewed and more fully developed. The course is extended to include algebra and geometry; natural science and physics, and their application to agriculture, to industrial arts, and to hygiene; political economy, French language and literature, general history, industrial and commercial geography, iron and wood work for boys, and cutting and fitting for girls. One foreign language is also included. Additional courses pertaining to local industries may be authorized by the minister upon the demand of local committees, supported by the academic inspector and approved by the departmental council.

In the primary (departmental) normal schools the studies of the primary course are reviewed with reference to methods of instruction, and at the same time developed to include the full scope and scholastic bearing of those subjects. Pedagogy and school administration are treated both theoretically and practically.

Instruction in the following subjects is given outside the regular class hours: In the normal schools for men, agriculture and manual work, military and gymnastic exercises, vocal and instrumental music; in the normal schools for women, needlework, housework and gardening, gymnastics, and vocal and instrumental music. The course of study in these schools covers three years.

The progress of education is fostered by many auxiliary agencies, both public and private. The most important of the former as regards the interests of primary education is the Musée Pédagogique. This includes a museum and a library for the collection of all material and publications which may aid the work or the researches of persons engaged in primary instruction. Here, also, classes and courses of lectures for teachers are maintained, and publications issued which make known the best methods of instruction, the best plans for the construction and equipment of schoolhouses, and the results of many valuable historical investigations.<sup>1</sup>

<sup>1</sup>For detailed account of the Musée Pédagogique, see article by M. Beurier, *Mon. Péd.*, Tome III, pp. 3-38

The following table shows the enrollment, absolute and relative to population, and the number of teachers at the specified dates from 1837 to 1891-92, inclusive:

| Years.        | Pupils.          |           |                    |                                      | Teachers. |        |                  |
|---------------|------------------|-----------|--------------------|--------------------------------------|-----------|--------|------------------|
|               | Number enrolled. |           |                    | Number for every 10,000 inhabitants. | Men.      | Women. | Total.           |
|               | Boys.            | Girls.    | Total.             |                                      |           |        |                  |
| 1837 .....    | 1,579,888        | 1,110,147 | 2,690,035          | 752                                  | 39,302    | 20,433 | 59,735           |

*a* Including 70,554 in Algiers.

*b* Including 1,840 in Algiers.

*c* Including 85,068 in Algiers.

On account of the changes made in the financial system it is extremely difficult to carry a comparative statement of expenditure further back than 1887. The total expenditure in that year was 173,241,057.85 francs (\$33,435,524), and rose to 186,306,073.39 francs (\$35,957,073) in 1892. These amounts were derived as follows: In 1887, from the State, 49 per cent; from the departments, 16.05; from the communes, 34.95 per cent; in 1892, from the State, 87.9; from the communes, 12.1 per cent.

The great increase in the part of the expenditure borne by the State is due to the financial legislation of 1889 under which the State assumed the charge of the teachers' salaries, and also of the ordinary expenditure for the departmental normal schools.

The totals given above include the expenditure for normal schools, 9,741,017.67 francs in 1887, and 9,284,241.72 francs in 1892, and also certain optional expenditures which fluctuate greatly from year to year.

If these items be deducted, the ordinary expenditure for primary schools stands at 121,545,868.70 francs (\$23,458,353) in 1887, and in 1892 at 171,395,206.64 francs (\$33,079,275).

The former amount was equivalent to 3.18 francs (61 cents) per capita of the population, and to 24.48 francs (\$4.82) per capita of pupils enrolled, the latter to 4.43 francs (85 cents) and 36.20 francs (\$6.98), respectively.

The foregoing statistics are confined to particulars which pertain to all systems. The additional tables that follow relate to features that are peculiar to the French system.

Under the Republic only public schools derive their support from public funds, and they are, as we have seen, closed against clerical influences. The distribution of pupils in the several classes of schools, i. e., public and private, lay or secular and clerical, indicates, therefore, to some extent the strength of the Government policy.

*Distribution of pupils in the several classes of schools.*

| Year.        | Public.     | Private.    | Secular.    | Clerical.   |
|--------------|-------------|-------------|-------------|-------------|

## SCHOOLS FOR ADULTS.

The most important recent movement affecting popular education is that for the increase and improvement of schools and courses of instruction for adults. Schools or classes of this kind have been sustained in France by the church or by private effort for nearly two centuries. Their importance was recognized by Guizot, although they were not mentioned in his law for primary instruction (1833). From time to time State appropriations were granted for this work, and by the law of March 15, 1850, the creation of public adult courses was authorized at the option of the communes. At that date such courses had already been established in 6,913 communes and enrolled 117,000 students. The provision declined under the political disturbances of 1849 and 1850, but during the second empire regained new vigor under the fostering care of M. Duruy. Through his efforts, while minister of public instruction, the law of April 10, 1867, was passed, assuring a State subvention to the classes for adults. Under this impulse the number of courses was raised to 23,586, with an enrollment of 800,000. The improvement was but temporary. During the early years of the present Republic the number of courses and of pupils in attendance declined and the State appropriations were correspondingly diminished. One of the principal causes of this retrogression appears to have been the want of a systematic organization of the classes; it was left to M. Gréard, the distinguished chief of the Paris Academy, to inaugurate a reform in this respect.

In accordance with the principles laid down by M. Gréard, the prefect of the Seine issued an order in 1877 providing for the reorganization of adult courses in the capital. The courses of general instruction were separated from technical courses for apprentices and were graded in three classes—elementary, intermediate, and superior. A diploma, or special certificate of primary studies, was created, open to pupils of at least 16 years of age. Finally an annual gratuity of 600 francs was assured to the teacher in place of a grant calculated upon the average attendance at his class.

The laws of 1882 relative to public instruction made no mention of adult schools. These laws, it has been observed, "reorganized but at

the same time decapitated public education." They kept the children from the sixth through the twelfth year under a severe discipline, filled them with ideas upon all subjects of knowledge, but, the twelfth year accomplished, plunged them into life without any further purpose or end than the regiment for men and death for women. The evils of this freedom were foreseen by Jules Ferry, and his influence is traceable in the decrees of 1884, issued under the ministry of M. Fallières. By these decrees every commune was authorized to establish a class for adults, the expenses to be borne half by the State and half by the commune.

As a result of this effort 36,000 classes were opened within a year. The avowed purpose of the classes was to overcome illiteracy in youth above the legal school age, 13 years, and the subjects taught were the same as in the elementary schools. As time passed the compulsory law with free schools brought all children into the schools, illiteracy was reduced to a minimum, and the original cause for the maintenance of adult courses was removed. In 1894 they had fallen to 7,000, or a decline of 80 per cent in a decade. Meanwhile it appeared that the proportion of conscripts, who, although not totally illiterate, had a mere smattering of letters, was constantly increasing, and that there was an alarming prevalence of crime among adolescent youths. A well-known essayist, M. Béranger, writes:

This is the gravest social danger that menaces the secular state.

Between 11 and 20 years, the age of developing puberty, when conscience is disturbed, when the character is forming, the youth of the common classes are socially abandoned.

The clerical party have not been slow to take up the cry and accuse the state of having destroyed the moral safeguards which the church formerly threw around wayward and irresponsible youth.

That the evils complained of are real does not seem to be questioned, and the Government is aroused to the necessity of continuing some form of guidance and control through the years of adolescence. The schools or classes for adults naturally offer the means for this prolonged guardianship, but it is not the school limited to elementary subjects and routine methods that can be relied upon to influence, restrain, and direct the energies of young men and women. These schools must be reorganized, made attractive, and of practical utility if they are to accomplish their new mission. The question is exactly the same that has recently been discussed in England with the result that the evening schools of that country have been completely transformed. Some such course must apparently be taken in France. The Government began the work by a special investigation committed in March last (1895) to M. Edouard Petit, a professor in one of the Paris lycées. He was instructed to make an exhaustive inquiry into all the conditions bearing upon the instruction of adults, and to report to the minister in full the results of his investigation. The mission was ably fulfilled, and the report covers fully all questions of methods, programmes, instruc-

tion, apparatus, finances, etc., that must be settled before the work of reorganization actually begins.

M. Petit found it impossible to secure exact information as to the number of adult courses in actual existence. He estimates it at ten or twelve thousand, and finds everywhere that primary teachers are ready to undertake the work. In respect to programmes, peculiar difficulties arise from the passion of the people for unity, order, and exact rules, and their constant habit of depending upon these. To be effective, it is necessary, as M. Petit observes, that these courses should be "infinitely varied." He would advise, therefore, a "sort of general plan" which may serve as a guide to the instruction, but leave the details to be determined by time and circumstance.

The methods of instruction must be varied, like the programmes; some subjects ought to be treated by courses of connected lessons which should last at least three months with three sessions a week, each occupying one and a half hours. Conferences—that is, exercises in which the students discuss the subject with the teachers—should be a little longer. As to illustrated lectures, scientific demonstrations, etc., these must be left to the discretion of the managers. Heretofore, only elementary teachers have been engaged in the work of adult instruction. M. Petit would enlist, also, the professors of secondary and superior instruction, and even specialists who are outside of the university. Thus the adult courses would become a means of uniting the three orders of instruction. As to auxiliary aids in the work of instruction, M. Petit emphasizes the importance of public libraries and of apparatus, and particularly the use of the magic lantern ("projections lumineuses"). "The magic lantern," he says, "exercises an irresistible attraction in a village and even in a city. It is a fête day in many communes when it is announced that the views obtained from Paris have arrived." So great is the interest excited, that in a number of communes subscriptions have readily been raised for the purchase of a lantern and views, and in several instances communes have clubbed together to secure the coveted apparatus. M. Petit advises a fixed remuneration for teachers engaged in the work, prizes for the students, and medals and academic palms for the most successful teachers. As to the sources of support, first and chief would be local contributions or appropriations; nevertheless, M. Petit recognizes clearly that the State must bear a part in the expense. For the first year he estimates that 250,000 francs (\$50,000) from the public treasury would suffice; in four or five years the subvention should be doubled and even quadrupled.

Such, in brief, are the measures proposed in the report which M. Petit has submitted.

While the future policy of the Government in respect to public courses for adults is not fully formulated, it is evident that the instruction provided will pertain to subjects beyond the elements, and that

every means will be employed to make it interesting and of practical utility to the students. Meanwhile private societies throughout the country are redoubling their efforts in the same direction.

Particularly significant is the action taken by the Havre society for instruction by object teaching (*"enseignement par l'aspect"*). This society celebrated its fifteenth anniversary in May last by calling a congress of all the societies for promoting popular education, to meet at Havre in the following August for the consideration of this very subject.<sup>1</sup>

Above four hundred delegates responded to the call, and the assembly derived prestige from the presence of President Faure. M. Poincaré, minister of public instruction, M. Ferdinand Buisson, director of primary instruction, and M. Gréard, rector of the Academy of Paris, took active part in the proceedings.

The general question was resolved into four topics, each assigned to a distinct section of the congress: (1) Courses for adults; (2) popular lectures; (3) instruction by objects; (4) sources of support and patronage; but, as observed by M. Compayré, beneath these four different forms "was one and the same question:" "How can we continue and complete the work of instruction and education commenced by the primary school?" The discussions and the resolutions adopted by the congress followed substantially the lines of M. Petit's report. The purposes of the adult courses were defined as follows: (1) Moral and civic education; (2) general instruction; (3) technical training. The importance of public libraries and the means of utilizing them for the benefit of the people were emphasized. The need of public funds for the work was recognized, but it was urged that private societies must be the main dependence.

This congress is but one feature of what has become an active campaign in behalf of a work similar in its spirit and purposes to that carried on in this country by Chautauqua circles and university extension. The press of France is largely enlisted in the matter. The *Revue Bleue* secured letters on the subject from some of the most prominent authors and leaders of public movements,<sup>2</sup> among these M. René Goblet and M. Léon Bourgeois, former minister of public instruction; Max Leclerc, the well-known essayist; M. Wagner, author of *"La Jeunesse;"* Henri Marion, philosopher and historian. The editor, M. Henry Béranger, prefaces the series by a historical survey which dwells particularly upon the initiative already taken by private societies in this matter.

What the Government has not as yet been able to do [he says] private societies have undertaken. When the *"Ligue de l'Enseignement,"* established at the end of the second Empire by Jean Macé, had realized its first ideal in establishing a law making instruction secular, obligatory, and gratuitous, its mission was not ended.

<sup>1</sup> See Proceedings of the Educational Congress of Havre, pp. 303-305.

<sup>2</sup> See *Revue Bleue*, August 24, 31, September 7, 1895.

The society considered that after the child there is the youth, and from that moment turned its efforts toward the reorganization of the courses for adults. This powerful league, distributed throughout France in numerous independent sections, introduced the magic lantern, which popularized the great events of history, the grand scenery of nature, and the attractive mysteries of the science of life. This particular expedient (*enseignement par l'aspect*), of which the Society of Havre affords an excellent illustration, has been one of the most profitable pedagogical outcomes of the movement.

About the same time certain powerful societies were organized in Paris to spread knowledge among the people. The Association Polytechnique, afterwards the Association Philotechnique, organized practical evening courses in letters, science, and arts. These two associations, to-day very flourishing, have rendered, and still render, the greatest service to the Parisian people. Two other important societies, formed among boys scarcely out of the high schools—the Union de la Jeunesse Française and the Union de la Jeunesse Républicaine—organized series of weekly conferences on literary, scientific, and moral subjects, and have thus contributed to the diffusion of intellectual life among the people.

The Parisian youth, therefore, have been abundantly furnished with all facilities for instruction, if not for education. It has not been the same with adults in the country. Not only has no institution been founded for them, but the school laws remain a fiction in many communes. The political divisions in every village, the frequent struggle between the schoolmaster and the priest, have prevented collective effort. To this neglect of youth must be attributed the increase of alcoholism and the manifestation of an ignorant and vicious spirit.

In 1891 an energetic young man, M. Guérin-Catelain, founded the Société Nationale des Conférences Populaires, embodying in this ideas that Lanthenas, Lakanal, and Condorcet had successfully carried in the conventions of May, 1792, and of July, 1793. He proposed, with his volunteer collaborators, to spread gratuitously in all France civic and humane instruction by means of printed lectures or lessons. This system was very ingenious. A scheme for a moral, scientific, or literary lecture or conference, drawn up by a competent person, was published, at the expense of the society, by thousands of copies. A copy put in the hands of the schoolmaster serves him as the model of a lecture and the basis of remarks before an audience composed of the working or rustic people. The society has had great success. It comprises to-day more than 3,000 directors of conferences and reported 6,000 conferences or lectures on the physical sciences applicable to agriculture, history, and hygiene in the single winter of 1893-94. Fifty texts, written by MM. M. de Nansouty, J. Siegfried, Félix Hément, E. Legouvé, A. Theuriet, George Ville, J. Steeg, etc., have been read thousands of times in thousands of cities. This work, an entirely private initiative, is a fine example of social effort, and shows what seeds one single effort can sow in a country like ours.

Some time after, in April, 1894, the bureau of the "Ligue de l'Enseignement" called together at Paris a committee to organize and collect opinions on the question of the instruction of adults. The call of the committee was not in vain. In August, 1894, the league held at Nantes an important congress, composed of publicists and professors. They outlined a plan for the reorganization of the courses for adults. M. Ferdinand Buisson, in the name of the minister of public instruction, and M. Léon Bourgeois, in the name of the "Ligue de l'Enseignement," delivered two remarkable discourses on the gravity of the problem and the imperative obligation of the State and the society to secure the cooperation of the people. In December, 1894, the superior council of public instruction prepared and adopted a project of law for organizing the courses for adults in accordance with new demands. The legislature alone has shown indifference in the matter, inscribing in the budget of 1895 the mere pittance of 20,000 francs for adults, in comparison with 120,000,000 francs that they continue to spend for the primary schools. But the idea has advanced. The publicists authorized MM. Félix Petit, Max Leclerc, Beurdeley, etc.,

to point out the defects in our system and explain the reforms accomplished abroad. From the Government also M. Edouard Petit, who, by his spirited writing, as well as his eloquent words, has made a veritable crusade in favor of the education of adults, received three months since a commission to undertake an exhaustive inquiry into the subject and to gather everywhere the views of the teachers and the people. The result of this inquiry has been drawn up in a report, which is now in the hands of the minister, and will be without doubt the beginning of a grand administrative reform.

The following account of the purposes and proceedings of the Havre congress, by Mr. H. R. Bigelow, United States consul, received as this matter goes to press, fittingly concludes the review of this subject:

SUMMARY OF PROCEEDINGS OF THE EDUCATIONAL CONGRESS,  
HAVRE, 1895.

By H. R. BIGELOW, *United States consul.*

FREE CONGRESS OF THE SOCIETIES FOR POPULAR EDUCATION AND INSTRUCTION, HELD AT HAVRE, AUGUST 30 AND 31 AND SEPTEMBER 1, 1895.

M. Poincaré, minister of public instruction, public worship, and the fine arts, honorary president, in the chair.

On the 28th of March, 1882, a law was passed establishing gratuitous obligatory education over the whole of France for all children between the ages of 6 and 13.

Notwithstanding this law, and notwithstanding the supervision of the special committees of each municipality, it has been proved by statistics that in 1893, out of about 300,000 conscripts of the year, 28,000 were utterly devoid of instruction.

The large towns, indeed, helped by the philanthropic societies, continue to provide their inhabitants with several gratuitous classes for adults, but the case is different in the rural communes, where attendance at the elementary school has caused the disappearance of three-fourths of these classes, formerly attended by the illiterate, although there are still 2,000 free societies for popular education in our country.

[TRANSLATOR'S NOTE.—The word "cours," so constantly employed in this report, answers to several English meanings, such as class, lecture, lesson, etc. The word "class" has been taken as the most general. "Patronage," also, comprises protection societies, friendly societies, aid, help, etc., societies. The word "patronage" has been retained as covering them all.]

Public opinion was moved by such a state of affairs. In 1884 M. Jaoulet, an inspector-general of elementary education, drew attention to the enormous loss among young people of what they had acquired at the obligatory schools. The pedagogic press and some eminent professors of the university took up the question. A society of public instruction—the "Ligue de l'Enseignement"—affirmed in 1894, at the congress of Nantes, that if the elementary school gives the child the minimum of elementary notions absolutely necessary for every civilized man, it will still be indispensable to give him more extensive information, adapted as far as possible to his profession. And finally, in last January, the expediency of organizing adult classes was brought before Parliament and discussed there.

In France the province of the State is extensive. The public-instruction budget exceeds 160,000,000 francs. From this sum the ministry can not deduct more than 100,000 francs for a reform that would require the help of the 100,000 school-teachers. With such slender resources, how could they be remunerated, even were the communes to be taxed for it?

This state of affairs induced the Government to set on foot an inquiry as to the creation of classes, lectures, popular libraries, societies of patronage for those leaving school, and as to the most rapid and economical means of attaining its object.

It was at this point that the "Havre Society for Instruction by the Aspect" (founded in 1881 to adapt a rational system of luminous projections to popular lectures) took the initiative of inviting the representatives of the French societies of instruction and education, the directors of libraries, the editors of pedagogic newspapers, to meet in a body at Havre, bringing their ideas and their experience to aid in the solution of this problem. At the same time the society asked the minister of public instruction to take the chair at this congress, not so much to direct it as to be himself guided by the competence and the free discussions of the delegates.

A considerable number of communications relating to the questions to be discussed were sent beforehand to the reporters charged with their methodical classification, and each adherent received the regulations, distributing the work among four sections. Each section, having chosen its president and secretary, was to deliberate apart, after which the resolutions were to be voted by the majority in full assembly.

#### PROGRAMME.

(1) *Classes for adults*.—Organization; educational code; methods and processes; special classes for girls.

(2) *Popular lectures*.—Industrial centers; rural centers; different systems of organization; subjects, choice of lecturers.

(3) *Teaching by aspect (objects)*.—Luminous projections, various modes of application; apparatus; photographic views on glass; choice and classing; circulating collections.

(4) *School societies of patronage for boys and girls*.—Games; lectures; savings; foresight; reciprocity.

On the 30th of August, in the presence of 400 members of this congress, the minister of public instruction, who was accompanied by M. Gréard, vice-rector of the Academy of Paris; Captain de Lamothe, representing the President of the Republic; M. Buisson, director of elementary education, and many prefects and members of Parliament, opened the meeting with a remarkable speech, dwelling upon the desire of the Government to be enlightened by the free discussion of the members summoned to express their views in a kind of national consultation.

The day was devoted to the special and simultaneous work of each section; the motions adopted were printed during the night and given to each member at the opening of the next day's meeting.

On the 31st of August, in full assembly, all the groups agreed in rejecting every programme or official interference in the application of its motions.

One of the most important discussions turned on a proposal to institute examinations to be passed by the conscript on his entering the regiment. The reporter urged the necessity of employing every means to attract pupils to the classes for adults, which are in danger of being but little attended if left optional.

Among these means would be the prospect of having to pass an examination, and having the marks put down in the military certificate book. The opponents of the proposal feared to create a certain inequality among the soldiers, and observed that there are regimental schools everywhere.

The motion was rejected.

#### PRINCIPAL RESOLUTIONS VOTED.

*First section*.—To encourage the formation of adult classes in localities where the town council is unfavorable.

To make the necessary steps easier for the schoolmaster or mistress by simply requiring them to advise the competent authorities of their intention.

To obtain the help of the Government in the foundation of free societies for education by the simplification of the legal formalities.

State grants to the societies for popular education that aid in the formation of similar societies in the departments by sending them delegates, lecturers, etc.

Entire freedom in the selection of programmes, according to local needs, left to the directors of classes.

Threefold object of the classes: (1) Moral education. (2) General instruction. (3) Professional education.

Forms of the classes: (1) Preparatory. (2) Finishing. (3) Designed for soldiers. (4) Designed for apprentices. (5) Technical and professional (living languages). (6) Superior.

The organization of the classes left to the free societies. State grants by results.

*Second section.*—Generalization of popular lectures. Members of the university encouraged by the university authorities to give lectures and to cooperate with the free societies.

*Third section.*—As much as possible to employ luminous projections to bring educational and professional knowledge within reach of every mind. To make an appeal to authors to draw up a collection of conversations to be sent to every commune in France, with a list of the views to be projected. To encourage the execution of views for projection, so as to facilitate the detailed study of history, geography, and natural history, should a collection of objects be wanting. Creation of artistic, scientific, industrial, and commercial museums.

*Fourth section.*—Object of societies of patronage: Morally, intellectually, and physically to watch over and protect children and young people. To appeal to the school funds and to the various institutions able to help in the development of societies of patronage. To find situations for the young people and to watch over them. To develop a spirit of foresight and reciprocity.

On the 1st of September, at the closing ceremony, the minister of public instruction made another speech. He did justice to the spirit of solidarity animating the members of the congress (as well the State functionaries representing private societies or committees, as the independent delegates) in the task they had undertaken individually with such genuine good will.

The part of the public powers, added he, is carefully to study all enlightened manifestations; to show their solicitude for the individual action of associations and of private persons; to make grants to poor communes, and, by everywhere exciting every energy, to complete the work of national education without increasing the burden on taxpayers.

#### MOVEMENT FOR THE ADMISSION OF AMERICAN STUDENTS TO THE UNIVERSITIES OF FRANCE.

The movement for admitting American students as candidates for degrees at French universities is exciting great interest in both countries. At the international congress on superior and secondary instruction, held in connection with the Paris Exposition of 1889, the matter was discussed under the general subject of the international equivalence of degrees. Eminent leaders of modern France urged the importance of a policy which should attract foreign students to the country by the prospect of merited honors. This course was urged from motives of patriotism as well as those of scholarly freedom. M. Lavissee voiced the prevailing sentiment when he said:

Happy are the people who know how to attract to themselves the youth of other nations. \* \* \* They are making friends for the future. No nation has greater need of such friends than France, none is more capable of securing them. Let us strive to attract young foreigners; let us call them to our midst and receive them cordially. They will see with their own eyes how this country, so often calumniated,

lives, thinks, and works. They will readily discover that it does not live and think and work for self alone. We shall serve France in thus making her known, for it is impossible to know without loving her.

Utterances like these were intermingled with practical suggestions for accomplishing the desired purpose. The most important of these was the proposal to encourage students to pass two or three semesters at one of the universities by establishing standards of equivalence in accordance with which degrees secured in foreign establishments would secure recognition in France. The necessity was recognized and the proposal supported, but there, apparently, the matter would have ended but for the efforts of an American enthusiast, Professor Furber, of Chicago. This gentleman has been anxious to see the French faculties open to American students on like liberal terms with those of Germany. In May last (1895) Professor Furber presented to the French minister of public instruction the following memorial on the subject:

CONCERNING THE ATTENDANCE OF AMERICANS AT THE UNIVERSITIES OF FRANCE.

[Memorial presented to the ministry of public instruction.]

With the advance of education in the United States the number of Americans attending European institutions of learning has increased. This migratory tendency on the part of those best prepared for the assimilation of knowledge and its dissemination in their native land has brought the nation closely into touch with the intellectual life of such countries as its students have been permitted to frequent. There is a growing desire to profit by the thought of other lands, and to overcome the crudities of a new civilization by a study of the old.

Eminent in every branch of learning, in many unsurpassed, and offering exactly that refinement of culture of which the transatlantic world is most in need, it might be supposed that France would draw to her shores no small contingent of America's academic pilgrims. Unfortunately, this expectation is not sustained by fact. At the Sorbonne there are hardly thirty Americans enrolled, as compared with some two hundred at present in attendance at the University of Berlin; while comparing the smaller institutions of France and Germany the disparity is even greater.

To what is this to be ascribed? Unless it be assumed that France is intellectually inferior to Germany—an assumption that can hardly be maintained—the only possible grounds for this phenomenon would seem to be, either that the Americans are unaware of the merits of French scholarship, or that some obstacle deprives them of free access to the schools of France. The former explanation is admissible only as a corollary to the latter. The real reason for the scarcity of American students in France and the successful rivalry of Germany in this particular may be found, perhaps, in the regulations which affect the foreign student in the universities of these respective countries.

In Germany an American is allowed to matriculate and qualify for a degree on the basis of a certificate of graduation from some reputable college of the United States. In certain instances, though with questionable propriety, even this condition is dispensed with. Throughout his course he is at liberty, moreover, to elect the studies he may desire to pursue. The two functions of the university, that of providing facilities for education, and that of certifying to intellectual attainment by the granting of diplomas, are kept rigidly distinct; and the student is free from examination, excepting when he chooses to apply for a degree. Prior to this juncture there is no effort made to test his progress—no disposition to question the nature or method of his work. Credentials certifying to the proficiency of his early schooling, a certain minimum of time spent at the universities of Germany, and a severe test

of his abilities at the termination of his course are, in short, the only important formalities to which a candidate for academic honors is required to submit.

In France, on the contrary, the student is throughout his university career subjected to regulations which practically exclude the greater number of Americans. There is no established equivalent for the diploma of the French lycée with which to seek admission into certain faculties; the course of study is to a large extent prescribed; compulsory examinations are held at frequent intervals, and a surveillance is thus exercised over the study of the student that deprives him in no small degree of the character of a free investigator.

It is obvious that, for the type of Americans found in Germany, it would hardly be profitable to submit to the strict régime imposed by France. The students from the United States are, with rare exceptions, men who have passed beyond the rudimentary grades of education, and have reached the stage of specialists. They are of intellectual maturity, graduates from native institutions, and are in quest not of discipline but knowledge. To such as these the privilege of independent research is indispensable, and they seek Germany instead of France. To be sure, it is possible for them to be inscribed as special students, and to secure as such the many educational advantages that the latter country courteously offers; but this does not lead to a degree, a consideration which, though of trivial importance as compared with other fruits of study, is still sufficient to create a current toward the seats of learning where a diploma can be incidentally secured. When it is remembered that many of the Americans in Europe intend in time to apply for professorships at home, it will be seen that this patent of successful effort while abroad is something more to them than a mere ornament.

The course of action necessary on the part of France in order to secure the patronage of the Americans may be suggested by what already has been said. It is the formalities alone that cause embarrassment. The American student does not desire that any essential requirement should be suspended. He does not request that the grade of scholarship necessary either to matriculation or to graduation be lowered in his favor. He would only ask that the peculiarity of his purpose and position be taken into due account; and that he be permitted to fulfill through some equivalent the requirements which in the nature of his case are otherwise next to prohibitive. The only really burdensome regulation is that relating to compulsory examinations, which, when frequent, not only tie the student more closely to set lines of study than is advantageous for the American but, on account of the strangeness of the language, during the early portion of his course are doubly arduous. An arrangement similar in principle to that which the French faculties of medicine have already adopted, whereby a foreigner, under certain circumstances, may take all his tests en bloc, would relieve him of every obstacle in this direction. This, and possibly a designation of the American colleges whose degrees would be accepted as an equivalent for the diploma of the French lycée, are the principal concessions the American student would desire. If it be thought that, other things being equal, he would thus be given an undue advantage over the native students in securing academic distinctions, his examinations might be so increased in their severity as to remove all possibility of any such unjust discrimination. The Americans would discover nothing inimical to their interests in any degree of proficiency which the French universities might consider it proper to demand of them; nor would they regard as inordinate a regulation insisting upon a somewhat lengthy term of residence in France. In this respect they would be satisfied if only they were permitted to utilize their period of study as they deem most profitable, and to prepare themselves for a final test of their abilities in the manner they find most convenient.

The educational system of the French is based upon a theory—a theory which implies continual surveillance over the progress of the student; and in this it differs intentionally from that of Germany. That the methods which obtain in France have their own distinctive merits is not to be disputed. There is no desire to criti-

cise the organization of the French universities or to bring them into unfavorable comparison with those of other countries. It is safe to assume that the educational institutions of the nation are adjusted, as they should be, to its own peculiar needs, as are those of Germany to hers. The purpose here is simply to emphasize the fact that the American student is not offered by the French the same facilities he enjoys in certain other quarters; it being of course a question whether or not the interests of France are sufficiently at stake to warrant her in taking action to amend the present condition of affairs.

That an American clientèle such as the French schools have it in their power to command is able to commend itself is evidenced by the distinguished consideration the students from the United States have won in Germany, while the degree in which America appreciates the hospitality accorded her is shown by the effort of her universities to encourage foreign travel and research. Her faculties contain an increasing per centum of scholars whose education has been received to some extent abroad; and in many institutions of the United States scholarships exist whose purpose it is to give the students fortunate enough to earn them the benefit of European study.

Combining, as our Western civilization does, two great elements, the Latin and Germanic, it is for the interest of America to study both, and in the opinion of many able thinkers the time has come when the former element, and this as best exemplified in France, is the one to which her students should especially address themselves. It is, therefore, not to an indifferent public that France is invited to extend her courtesies.

On the other hand, there are considerations besides those of simple magnanimity that may be of moment in determining the course the French universities may choose to take. The young savants who visit Germany in growing numbers are already influencing American opinion. Berlin, with which Paris easily might vie for honors, is beginning to be regarded as the scientific Mecca of the world; and despite the favor in which French culture stands with many, there are in certain circles in America indications of little less than a German cult—an enthusiasm for German thought and views that unconsciously unites with the high esteem in which the learning of Germany is justly held a partisan interest in her political aims and aspirations. It is from causes such as these that national friendships and animosities frequently arise. The men who flock to the universities of Europe are the ones who will mold the ideas of the rising generation; and the sympathies of the nation will surely follow in the footsteps of her students. It is accordingly not the interests of a few individuals alone that are involved. The intellectual life of the whole United States, together with her sympathies for France, can not fail to be affected in some measure by the attitude the French assume in regard to the question here submitted.

A meeting was subsequently called at the Sorbonne (June 26) to consider the subject. M. Gréard, rector of the Academy of Paris, presided and leading professors took part in the proceedings.

The interest which these measures excited was greatly stimulated by an article from M. Michael Bréal, which appeared in the *Journal des Débats* of June 7. In this article, which was republished in a pamphlet issued by the university committee, Professor Bréal contrasts policy of Germany and France in respect to foreign students.

He says:

In Germany nothing is easier than to be accepted and treated as a student. Provided you bring a certificate from some good institution for secondary education, that suffices; you are enrolled and take the academic oath. The rector bids you welcome. Thenceforth you are admitted to the courses and find yourself on exactly the same

footing as the native student; you are a regular pupil of the Albertina or of the Georgia Augusta. You frequent the laboratories and, if an able man, take part in the exercises of the seminar—always paying, be it said, the requisite number of gold Fredericks each half year. No examinations for passing to a higher grade, no test of progress casts a shade over the tranquillity of these happy years. You have time to become familiar with the language of the country and with the spirit of the university, to form friendships and acquaintances, and to steep yourself in the atmosphere of your surroundings.

But this is not all. The student who has spent two or three years in a foreign country naturally wishes to bear away some reward for his effort, some authentic proof that his time has been worthily employed. The German doctorate is admirably adapted to this purpose. You write a thesis of moderate length and average difficulty on some subject of your choice. After a series of interrogations in which the good nature of the judges tempers, if need be, their just severity, you are proclaimed doctor; and you take back to your own country a diploma graced by names venerated and renowned throughout the scientific world. It is true that this diploma gives no assurance of obtaining a position. It confers no prerogatives either in Germany or elsewhere; but as this is understood beforehand, and as the conditions are the same for Germans also, there is no cause for surprise or for complaint.

It is to this adaptable and supple organization that Mr. Harry Furber traces the preference distinctly accorded to the universities of our neighbors. We are far from believing it to be the only cause; but since it has been pointed out by a witness so well placed for forming an opinion, we can not help thinking that it should be regarded with attention. We have to ask ourselves whether, by certain requirements not wholly reasonable, we are not turning from us a clientèle which would ask nothing better than to take the road to France; but which, if we persist in our present course, will push forward more and more in the direction toward which it is now tending.

There are difficulties which result from our educational system. We know these difficulties are great, but they ought not to be insurmountable. There has been created, within the last few years, a *certificat d'études* for foreigners; this is something; but we are still far from the advantages, the seductive advances of the German organization, especially if we take into account the very sensitive amour propre of youth. What Mr. Harry Furber asks is, that foreigners should have the right to undergo the same examinations as French students, but that they should undergo them all together, or en bloc, at the end of their studies, provided they prove that they have spent a sufficient time at our universities. It is for our authorities to see whether this desire exceeds the amount of elasticity possessed by our regulations. If we are not mistaken, something of this kind has already been done for medicine.

Professor Bréal also notes that present conditions in France are more favorable to the new project than those that existed in the last decade. He says:

Twelve or fifteen years ago, with our system of centralization, it would have given rise to some embarrassment to bring together upon the same spot, Paris, any large number of foreigners whose presence would have resulted in overcrowding, with all the annoyances and inconveniences that follow in its train. But this danger is no longer to be feared, since we could say to the friends from without: "Our universities are open to you; we invite you to frequent them and to sit by the side of our own children. But we counsel you in your own interest not to crowd yourselves into a city already overflowing, on to benches already overfilled. Would you know French life intimately and in its purity? Then choose one of our provincial universities; continue in the provinces the investigations Mr. Harry Furber has so happily

begun in Paris. Nowhere will you find scientific institutions that are larger or more convenient than those of Lyons, nowhere equipments more extensive than those at Lille (they have just been inaugurated). In the provinces you will run no risk of being isolated. The companionships formed so easily in youth, and among us more easily than elsewhere, will not be long in becoming frank and cordial. Would you revel in a rare climate, a rich and unfroward nature? Go to Dijon, to Toulouse, to Bordeaux, or to Montpellier. For my own part, were I to begin my life again, I would not be a student elsewhere than at Grenoble, within sight of the Alps, beside the swift waters of the Isère. And you will find everywhere the French—French language, the French literature, French ties. Have no fear that you will be imprisoned in a corner; there are associations that will undertake to transport you from fête to fête, from south to north, from east to west. Keep Paris, if you like, for the end, when, having completed your studies, you want to become acquainted with the furnace in which all these diversities are united and smelted down.”

As a result of these initiatory efforts a committee of university men and officials was formed under the name of the committee Franco-American,<sup>1</sup> to promote the purposes expressed in Professor Furber's Memorial. An American committee, advisory to the first, has also been formed in the United States, under the presidency of Prof. Simon Newcomb.

At a meeting of the latter committee held at the Columbian University, Washington, November 13, 1895, the following resolutions were formulated:

1. This committee has heard with great pleasure of the movement of eminent educators of France, having for its object the admittance of American students as students and candidates for degrees at the French universities. This committee heartily reciprocates the desire for yet closer bonds of intellectual sympathy between France

---

<sup>1</sup> The members are as follows: Berthelot, of the Institute; Bertillon, director of the bureau of municipal statistics; Bonet-Maury, professor of the faculty of Protestant theology; Boutmy, of the Institute, director of the *École des Sciences Politiques*; Michel Bréal, of the Institute, professor of the *Collège de France*; Bufnoir, professor of the faculty of law; Xavier Charmes, of the Institute, director in the ministry of public instruction; Darbonx, of the Institute, dean of the faculty of sciences; Paul Dubois, of the Institute, director of the *École des Beaux-Arts*; his excellency James B. Eustis, ambassador of the United States; Friedel, of the Institute, professor of the faculty of sciences; Giry, professor of the *École des Chartes*; Gréard, of the *Académie Française*, rector of the *Académie de Paris*; Lannelongue, professor of the *Académie of Medicine*; Lavissee, of the *Académie Française*; Levasseur, of the Institute, professor of the *Collège de France*; Liard, director of higher instruction; Maspéro, of the Institute, professor of the *Collège de France*; Paul Melon, general secretary of the committee of patronage for foreign students; Paul Meyer, of the Institute, director of the *Écoles des Chartes*; Milne-Edwards, of the Institute, director of the museum; Gabriel Monod, professor of the *École des Hautes Études*; Moissan, of the Institute, professor at the school of pharmacy; Gaston Paris, of the *Académie Française*, administrator of the *Collège de France*; Pasteur, of the *Académie Française*; Perier, of the Institute, professor at the museum; Perrot, of the Institute, director of the *École Normale*; Planchon, director of the school of pharmacy; Sabatier, professor of the faculty of Protestant theology; Colmet de Santerre, dean of the faculty of law; Schefer, of the Institute, director of the *Écoles des Langues Orientales Vivantes*; Jules Simon, of the *Académie Française*; Albert Sorel, of the *Académie Française*; Vicomte de Vogué, of the *Académie Française*.

and the United States, which is implied by the organization of the Franco-American Committee of Paris, and by the interest with which it has proceeded to carry out its object. It would welcome the opening of the doors of the French universities to American students, as widely as those of Germany and the United States are now open to those of other countries, and believes that the friendly feeling implied by such action on the part of the French nation would be heartily appreciated by the American people.

2. As the decision where each American student shall pursue advanced studies, whether he shall avail himself of the rapidly increasing facilities for such instruction in his own country, or shall choose those afforded by the universities of France or Germany, rests entirely with the student himself; as, also, the reasons why American students flock to Germany rather than to France are too numerous and too delicate to be concisely formulated; this committee is unable to state authoritatively whether any suggested measure would or would not result in a large attendance of American students on French instruction. It believes, however, that the following two measures are those which would best promote the proposed object and would tend to encourage American students to avail themselves of the precious advantages offered by the well-organized system of university instruction now enjoyed by France:

(a) The acceptance by the French universities, as candidates for the doctor's degree, of Americans holding the bachelor's degree from any institution of learning of good standing in the United States; this degree being accepted as equivalent of that of the French lycées.

(b) Owing to the disadvantage under which the student would labor, especially in the early part of his course, on account of his lack of familiarity with the French language, it is suggested that instead of the frequent rigorous examinations required by the French system, informal ones should be substituted, the successful passage of which should not be obligatory.

The object of the examination would be the information both of the professor and the student as to the progress the latter was making, and the indication of measures necessary to make good any deficiencies in that progress. The committee believes that this policy would be better than the entire abandonment of current examinations, and would not involve any curtailment of the final examinations for the degree.

3. The committee does not believe that the institution of any system of special degrees or special conditions for foreign students would tend to attract Americans. The latter, if candidates for a degree at all, would expect and desire to fulfill all requirements exacted by the French regulations of native students, and, having fulfilled these requirements, would expect the same degrees.

4. After due consideration, the committee finds itself unable to supply a list of approved American institutions whose degrees should be accepted in France. It does not believe that any untoward event would follow from the acceptance of the baccalaureate of any American institution. Only the best students would under any circumstances seek the advantage of completing their education in France, and these might sometimes come from institutions little known outside their own neighborhood.

5. Without being authorized to speak for anyone but themselves, the committee feels sure that French students desirous of pursuing their studies in the United States, would be cordially welcome at any American institution of learning, and afforded all the opportunities and advantages enjoyed by native students.

As this matter goes to press, information is received as to the first practical outcome of the efforts of the Franco-American Committee. Mr. Furber, writing from Paris, January 21, 1896, says—

Friday last the conseil supérieure voted a decree reforming the "licence" (i. e. degree of licencié), in such a manner as will, I think, permit the French faculties of science to be as liberal in their regulations as are the German universities.

The new features introduced by this decree are: (1) Wider choice in the selection

of studies; (2) liberty to migrate from one university to another, and (3) the privilege of taking examinations successively or "en bloc," just as the student wishes. The student is expected to qualify for his licence in one of three groups of studies. Each faculty will determine its own groups. In Paris they will be as follows:

I. Differential and integral calculus, pure mechanics, and one other mathematical branch, as for instance, astronomy.

II. General physics, general chemistry, and one other branch of science, either mathematical, physical, or natural.

III. Zoology, botany, and geology.

Our students will be admitted on the basis of their American diplomas. If an able man, and thoroughly prepared, a student will be able to discharge the work required for his "licence" in one year, by carrying his three subjects simultaneously. He may, however, if he wishes, take them in successive years, traveling from one faculty to another, and following at the same time other courses.

After having pursued a study for a year the student has the privilege of applying for examination; and if he stands his test, receives a *certificat d'étude*. Whenever he secures three such certificates covering studies in one group, he receives the diploma of *licencié ès sciences*, and the doctorate is then to be obtained upon the presentation of a satisfactory thesis.

As you will observe, this is practically the German system, modified, so that the student may not only take his examinations whenever he is ready, but also receive independent credits for every portion of his work. The regulations I describe go into effect at the opening of the coming academic year. \* \* \*

The faculty of medicine already offers all the facilities I think we could desire, and the faculty of theology is about to make us valuable concessions. There will remain only letters and law to be arranged. And something may very possibly be done in these directions before many months elapse.

## CHAPTER IX.

### PUBLIC EDUCATION IN BELGIUM, 1892-93.<sup>1</sup>

---

*Belgium, constitutional monarchy.*—Area, 11,373 square miles; population (census of 1890), 6,069,321.

For previous article see *System of Public Education in Belgium*, Report for 1892-93, Vol. 1, pp. 157-201.

TOPICAL OUTLINE.—*Brief view of the system of education, with statistical summaries, current and comparative.*—*New school law of September 15, 1895.*

The report of the Commissioner for 1892-93<sup>2</sup> presented a detailed exposition of the educational system of Belgium, with statistics showing its progress. In brief, it may be said that the system is characterized by the union of central and local agencies, the State, the provinces, and the communes. There is the form of centralization with a high degree of local independence.

State appropriations are made for all grades of instruction, covering in 1892-93 about 38 per cent of the total cost of elementary schools, 65 per cent of the cost of public secondary, and substantially the whole cost of the State universities.

The curricula of public secondary schools and of the State universities and the appointment of professors in the same emanate from the central authority.

The Belgian State universities, like the French faculties, are not only teaching bodies, but constitute part of the machinery for the administration of superior instruction.

The State maintains a measure of supervision over both secondary and elementary schools through the agency of inspectors, but the commune, the smallest civil district, is the unit of and the controlling power in the elementary school system. In every commune there must be at least one elementary school. This may be a communal school, supported entirely by public funds; an adopted school, a subsidized private school, or a private school fulfilling the conditions of adoption. The communal council appoints the teacher and arranges the programme for communal schools, subject only to the requirement of the school law as to the obligatory branches.

The following statistical summary (p. 314) shows the status of the several classes of institutions at the latest date of report.

---

<sup>1</sup> Prepared by Miss Anna Tolman Smith.

<sup>2</sup> Vol. I, pp. 157-201.

| Classes of institutions.                                    | Pupils or students. |            |          |            |         |              | Teachers or professors. |         |         |        |         |         | Current expenditure. |               |
|---|---------------------|------------|----------|------------|---------|--------------|-------------------------|---------|---------|--------|---------|---------|----------------------|---------------|

## SCHOOL LAW OF 1895.

Intense excitement was created in Belgium during the year by the new school law which was promulgated September 15. The principal change effected by the law relates to religious instruction. This is made a compulsory subject to be placed at the head of all primary school programmes, instruction in the same is confided to the clergy who must have free access to the schools, either to give or to supervise the religious lessons as they may decide. The requirement extends to normal schools also.

The law of 1884 made religion an optional subject, and since that date it has been introduced into nearly all the schools, only 153 out of a total of 5,778 having failed to include it in their programmes. The reaction against the secular system established by the Liberals in 1879 has now reached the extreme point. The new law is opposed by the

Liberals, and demonstrations were made against it in Brussels, Antwerp, and other cities, while its passage was pending.

Although the excitement has subsided since the measure became law, its opponents have not relaxed their efforts to create a public sentiment against the admission of clerical influences into the schools.

The principal features of the law, the obligation to maintain schools, the required course of instruction, the provision as to free tuition and the control of religious instruction by the clergy are here given in full. The clauses bracketed are identical with those of the law of 1884.<sup>1</sup>

[Every commune must have at least one communal school situated in an accessible place.]

[The commune may adopt one or more private schools. In this case the King, upon the advice of the "permanent committee," may exempt the commune from the obligation to maintain a communal school. This dispensation can not be accorded if 20 heads of families having children of school age demand the creation or the maintenance of a school for the instruction of their children and the "permanent committee" concurs in this demand.]

The adoption may be valid for ten years or more. It will cease at the expiration of this time in case of the death or retirement of the teacher in whose name the agreement was made. The agreement is always renewable when no limit is fixed to the agreement. The same can not be annulled during the current school year nor without a year's notice.

[In case of necessity two or more communes, upon authority from the King, may unite to found and maintain a school. (Art. 1.)]

[Communal primary schools are directed by the communes.]

[The number of the schools and of the teachers is determined by the communal council, according to the needs of the locality.] In every case the decision of the communal council to suppress a public (communal) school or one or more teachers' positions must be submitted to the consideration of the "permanent committee" and to the approbation of the King. The royal *arrêté* authorizing the suppression must be published in the *Moniteur*.

[The council also controls everything relating to the establishment and organization of infant schools (*écoles gardiennes*) and of the schools for adults. (Art. 2.)]

[The children of poor parents receive gratuitous instruction.] The communes must see that all those who have the right to free tuition and who do not attend uninspected private schools are provided with instruction either in a communal or adopted school.

The following are entitled to free tuition for their children: Those whose entire tax amounts to less than 10 francs (\$2) in the communes having less than 5,000 inhabitants; less than 15 francs (\$3) in communes having from 5,000 to 20,000 inhabitants; less than 30 francs (\$6) in the communes of more than 20,000.

Every year the communal council must prepare a list of the children who have a right to free tuition under the conditions specified. The council determines the rate per capita which shall be allowed under this head to teachers of communal and of adopted schools.

The list, as well as the rate of allowance, must be approved by the "permanent committee," with a right of appeal to the King.

The communes, as also the principals of schools adopted or which might be adopted, may accord gratuitous instruction to other children than those included in the cate-

<sup>1</sup> For the law of 1884, see Report of Commissioner for 1892-93, vol. 1, pp. 199-201.

<sup>2</sup> A provincial body consisting of the governor of the province and six members of the provincial council, chosen by that body.

gories specified above. The "permanent committee" in advice with the board of charities and of the communal council, and with the right of appeal to the King, must determine the part which the board of charities must bear in the expense for children who have a right to free tuition. The portion so assigned is included in the appropriation for the board and must be divided between the communal schools and the adopted schools, the private schools fulfilling the conditions of adoption in proportion to the number of children in regular attendance having the right to free tuition. (Art. 3.)

Primary instruction comprises as obligatory branches instruction in religion and morals, reading, writing, elements of arithmetic, the legal system of weights and measures, the elements of the French language, of the Flemish or the German, according to local requirements, geography, history of Belgium, elements of drawing, singing, and gymnastics. Moreover, it comprises needlework for girls, and for boys in the rural districts notions of agriculture.

Communes have the right to extend the programme as may be possible or desirable.

In the primary schools to which the law is applicable the ministers of the several denominations shall be asked to give the instruction in religion and morals, or to cause it to be given under their supervision, either by the teacher, if he consents to do so, or by a person approved by the communal council.

The first hour or the last half hour of the morning or of the afternoon session shall be given each day to this instruction. Children whose parents make the request in the following form may be exempt from the religious instruction: The undersigned, in pursuance of the right conferred upon him by article 4 of the law relating to primary instruction, requests that his child be exempt from attending the instruction in religion and morals. (Art. 4.)

The inspection of the instruction in religion and morals shall be exercised by persons delegated by the "chiefs of the confessions." The delegates discharge their duties according to conditions specified in a royal arrêtée.

The chiefs of the several confessions notify the minister of the interior and of public instruction of the appointment of their delegates, who, after sanctioning the same, transmits the necessary instructions to the provincial and communal officials, as well as to the inspectors of primary instruction.

Every year, in the month of October, each of the "chiefs of religion" addresses to the minister of the interior and of public instruction a detailed report upon the manner in which the instruction in religion and morals is given in the schools controlled by the law. (Art. 5.)

That the teacher is not relieved by this arrangement from the duty of caring for the morals of his pupils is indicated by the following, which was embodied in article 5 of the previous law:

Teachers must show an equal solicitude for the education and instruction of the children under their charge. They are to neglect no opportunity to inspire in their pupils the sentiments of duty, love of country, respect for national institutions, and attachment to constitutional liberty. They must abstain from any attack upon the religious beliefs of the families whose children are intrusted to them. (Art. 6.)

Outside of the articles cited, the only important modification in existing conditions pertains to the application of the State appropriations. These are to be divided between communal adopted and private schools upon the same conditions. The law provides, as heretofore, that the expenses shall be borne by the communes, the provinces, and the State. The commune must take the initiative in establishing the school—communal or adopted—providing the building and equipments, and in

order to secure an appropriation, either from the State or the province—

Must contribute a sum equal to the product of 4 centimes additional to the direct tax, and must execute the law respecting primary instruction in all particulars.

The provinces must contribute for school purposes an amount not less than the product of 2 centimes additional to the direct tax. The funds at the disposal of the commune for primary instruction can not be used for another purpose. (Art. 7.)

As to the state appropriations, it is expressly stated that, "beginning with 1896, a credit voted annually by the legislature for the ordinary service of primary instruction will be apportioned among the communal schools, the adopted schools, and the private schools not adopted, but fulfilling the legal conditions of adoption.<sup>1</sup> The rules of apportionment will be the same for the three classes of schools. (Art. 8.) It should be added that all subsidized schools must make provision for a certain number of free pupils.

The requirements for admission to the public-teaching service are the same as under the previous law—

The communal schoolmasters are chosen from among those Belgians, either by birth or naturalization, who have gained the diploma of an elementary teacher after being trained in a public normal school, or who have passed an examination after having attended lectures during at least two years, or who have gained a diploma for secondary teaching (*enseignement moyen*) of the second degree. They can also be selected from among those persons who have successfully passed the teachers' examination before a jury appointed by the Government. (Art. 9.)

The right of appointing and suspending teachers and of revoking their appointments rests with the communal council, although appeal to the "permanent deputation" (provincial committee), and finally to the King, is possible in each case. There is the same provision for dispensing with the services of public teachers as under the law of 1884. This is accomplished by placing them out of active service with a temporary arrangement for salary (*en disponibilité*).

In the matter of salary, the position of the communal teacher is slightly improved. As against a minimum annual salary of \$200 for assistant teachers and \$240 for principals under the previous law, the present law fixes the following classes and rates:

|  | Principals. |        | Assistants. |        |
|--|-------------|--------|-------------|--------|
|  | Men.        | Women. | Men.        | Women. |
| Fifth class, communes of 1,500 inhabitants or less.....      | \$240       | \$240  | \$200       | \$200  |
| Fourth class, communes of 1,501 to 10,000 inhabitants .....  | 280         | 260    | 220         | 220    |
| Third class, communes of 10,001 to 40,000 inhabitants.....   | 320         | 280    | 240         | 220    |
| Second class, communes of 40,001 to 100,000 inhabitants..... | 360         | 320    | 260         | 240    |
| First class, communes of more than 100,000 inhabitants ..... | 480         | 440    | 280         | 240    |

The teacher must also be provided with a residence or indemnity for the same ranging from \$40 to \$160. (Art. 13.)

<sup>1</sup>The chief conditions of adoption are that the school be conducted in a suitable building, that at least one-half of the teachers hold diplomas or have passed a Government examination, and that the school be opened to state inspection.

An increment of \$20 is allowed for every four years of good service until the total increment amounts to \$120.<sup>1</sup> (Art. 15.)

The provisions of the law as to the service of inspection are the same as under the previous law, excepting that it is expressly declared that State inspection does not extend to instruction in religion and morals. The provisions as to normal schools are also unchanged, excepting that with regard to instruction in religion and morals. In this matter, as already stated, they are subject to the same rule as the primary schools.

---

<sup>1</sup> Teachers have the right to a pension upon the same terms as members of other branches of the civil service. They may demand the pension at 55 years of age or be retired with pension at 60. The amount of the pension is calculated for each year of actual service at the rate of one fifty-fifth of the average salary received for the last five years in the service.

## I.—THE NEW EDUCATION IN GERMANY.

The recent movement among teachers in the United States toward the introduction of Herbart's principles and practices of education has found many advocates and adherents, which fact again proves that the liberty of speech and discussion enjoyed in this country is conducive to progressive action. There are at present more adherents of Herbart in the United States than in Germany. History repeats itself in this. Froebel's kindergartens are quite popular here, while in Germany they seem to make very little headway. It is interesting and instructive to note how one of the foremost Herbartians in Germany, Prof. W. Rein, in Jena, views the subject from a German standpoint. He published in the *Deutsche Revue* of September, 1895, an article on "The old and the new education," which is here rendered in English garb:

Man is the most interesting study of man, and should perhaps interest him exclusively. Everything else surrounding us is either an element in which we live or a tool which we apply. (Goethe.)

Goethe's words place us face to face with the problem of education, for if man is the most interesting study of man we must conclude that it is not the mature man but the growing man which above all claims our attention and interest. Whenever we meet a perfected personality, the question unconsciously arises, What has made it so; how has it grown to be what it is? Our interest is directed to the time of his development, to the contemplation of the influences that determined the formation of his character from outside, and to the germs which predestined his growth from within. The great problem arises, How much of the development of man may be ascribed to necessity and how much to freedom, how much to nature and how much to art, how much to heredity and how much to acquisition through education? If we further consider that society consists of individuals, the problem becomes more comprehensive and difficult, for it becomes necessary to investigate the connection of the influences which have operated between the older and the younger generation in the course of centuries; the question will have to be met as to how far the force of education has been effectual in this process. Think of this effect as we may, one thing is beyond doubt, namely, that education is neither the result of blind necessity nor of unlimited arbitrariness, and that it exercises a definite influence upon the development of moral energies which saturate a whole series of generations. Why else would statesmen, political party leaders, church dignitaries, and laymen of all kinds try to direct the educational principles and monopolize the educational influence of the people?

Indeed, the mature has often tried to prescribe the course of the growing generation, and to do it more or less consciously. Philosophers and educators have developed their plans, fully conscious of certain aims in view, hoping they may be realized in the growing

youth. Thus Plato expected the realization of his social ideals by seeing the growing generation rise step by step to higher planes; Rousseau intended a rejuvenation of society through improvement in education and instruction in conformity with Leibnitz's dictum, "*Si l'on reformait l'éducation, l'on reformerait le genre humain.*" Fichte, who seized upon Pestalozzi's ideas, confidently expected the renaissance of his nation by the aid of a new national education. Luther demanded that the reformation of the church begin with the children; and in Alsace the hope of patriots rests upon the rising generation.

At present education is called for also as an ally of the state and the church, and it is public-school education which is meant. The state intends to lead school education as its ally into the field against destructive currents that are threatening to undermine its power; the church tries to reconquer by means of instruction in religion what it has lost among the people. All such efforts are in vain, for though the school may be expected to instill into the life of the young generation new thoughts that may serve as guiding lines when this generation has become adult, its influence will prove powerless if it is pressed into the service of existing institutions that oppose popular currents.

It is always objectionable to call upon the school to aid in a fight, for the school is a domain of peace. Here the artist, and not the warrior, is to work. On its threshold the waves of contention and strife must break, for immature minds grow best in the atmosphere of peace, until they are strong enough to participate in the labors of the day as ethical and religious persons filled with the love of national culture.

But at times in which strong movements make themselves felt in opposition to existing institutions and principles, the idea is always at hand of influencing the rising generation through school education so that they may become pillars of throne and altar. This thought lying so near, we need not wonder when those in authority in the government of state and church attempt to make their power play upon the rising generation and force them into certain directions of thought and development. Can this be done? we ask again. First, we may remind the reader of the fact that in human affairs a sharply defined tendency invariably creates an opposing tendency. I merely mention the political and religious radicalism of many elementary school-teachers, which is the inevitable fruit of a normal-school education tending to make meek and pious teachers. Persons may be forced to a certain degree, but ideas never. Into their depth no ruler's decree will penetrate, not even that of the most energetic and powerful man. That is the tragic element in those endowed with power which may kill persons but can not vanquish ideas. Ideas are invariably stronger than generations of rulers.

But should we let chaos rule in education by yielding to every new idea that may spring up? By no means. Education, of all things, should be kept free from partisanship in political and religious wrangles. It should firmly adhere to that which will abide, outlast the times, and

in the current of conflicting opinions will form the firm ground upon which we can keep a foothold.

To be sure; but what is abiding? Is it that which the old education transmitted to us? To a certain extent, yes. When Goethe, in the pedagogical province of the "Wanderjahre," declares veneration to be the fundamental principle of all education, we agree with him. For education aims at culture, and veneration for that which has been considered venerable at all times and by entire generations is a characteristic of true culture. In promoting this culture education is kept free from frivolous mockery as well as from thoughtless routine. Permeated with the feeling of having its roots in a soil that has been prepared by countless generations of men, it yet faces without prejudice the acquired treasures of art, and examines what of new possessions we have in state, church, and society deserving transmission to the next generation in order to enable it to continue the noble work of developing culture.

In this becomes apparent the profound difference between the old and the new education. The former, in estimating the accomplishments of culture, restricted itself to the transmission of knowledge for its own sake; modern education moved this transmission into the focus of character building, which idea is at present the central fire with which all processes of education and instruction are illuminated. In this central fire all special purposes and tendencies melt—tendencies which would narrow education down to pitiable dimensions. The state can expect of its schools that they will educate good citizens, but it must not claim of them the training of partisans. Likewise, the church may demand that the pupils become believers in divinity, but it can not demand that they be prepared to enter a definite theological system; or, in other words, the schools must remain undenominational.

Our educational institutions (in contradistinction to professional schools) can have but one aim in view: The formation of ethical character—that is, to lay the foundation of the character as firmly as possible. This chief object is void of all special purposes. We intend to educate neither people who are politically orthodox, nor strict church people; neither those who are practically inclined, egotistical men of the world, nor worshipers of idols, but simply human beings who are filled with ethical ideas, in which the abiding part of the development of humanity is crystallized, and which indicate the directions further development is to take.

There is something curious in this. School education of the present day follows ideals, yet the result, as is often lamented, seems to be the opposite: A race void of ideals. In former times people were not conscious of this aim of character-building; the young were merely instructed, and the result was a generation devoted to ideals. Is this a law in the life of nations that, when a people begins to loosen its ethical tension, the demand for an education tending to develop ideals

appears stronger than where the soul of the people knows nothing of egotism and love of money and spontaneously aims at the highest from inner necessity? When we hear it said that in times of a nation's degeneracy an ideal education is a powerful remedy against the evils of the time, we are tempted to believe in the truth of the law; but instantly the doubt arises whether education can accomplish much where the atmosphere of family and society is filled with pest germs, where an ever-open chasm exists between the idealistic flight of the school and the materialistic current of the home and the times.

The old education evidently had an easier task. Its spirit was the spirit of society. The school could sin a great deal without injuring the pupil's soul, for that soul could constantly be refreshed by the power emanating from the family. At present, when the family, during this terrible state of unrest through which our generation passes, is losing its strength and influence, it is to be replaced by the power exercised by school education. Modern education is conscious of this difficult task and all its recommendations center in the thought of ethical training, to which even simple instruction is to become a servant.

It is true many view this attempt with skepticism. Many, relying upon the law of necessary reaction, claim that two generations following one another are different in their inclinations and views. According to this, the influence of the education of an older generation upon the younger would be essentially negative. The fact is pointed out that very talented scholars develop most frequently in opposition to their teachers. These gifted students commonly gain decisive influence over their contemporaries by being men of action, artists, and influential authors, similar to the historical changes on the great stage of humanity which have taken place almost in opposition to education. Thus, for instance, the first Christians had a Jewish education, the Humanists had a scholastic education, the Church Reformers had a Catholic education. The same rule holds good in other manifestations of the human mind; for instance, in art. Hence it is often considered a useless attempt to gain immediate influence over a whole nation by educating its youth in particular directions.

We do not share this opinion. As it is impossible in any individual case to determine the boundary between the influence from without and the growth from within, so it will be difficult to determine what in the life of nations is transmitted from the adult generation to the younger and what the latter produces out of its own power. The mutual influence is so intricate that it would need the art of a divine being to disentangle the finely interwoven texture and to follow down to their last roots the infinite variety of combinations between educative influence and inner growth. It is enough to know that both the old and the new education presuppose the possibility of culture or training. Why else should we trouble ourselves to build up a system of education and calculate upon certain results by correctly applying it? The idea of

plasticity always stood in the foreground of educational considerations, but perhaps modern education is somewhat more cautious in its expectations. Helvetius thought that the pupil was entirely a product of influences emanating from education. Fichte said: "If you wish to rule man, you must do more than merely address him; you must fashion him so that he wills nothing but what you wish him to will." This is evidence of a noble enthusiasm for the cause of education, but it is not in harmony with the facts. On the other hand, modern education will be very careful not to go to the other extreme; that is, to see in the pupil only a product of heredity. If such a position were taken, all educational influence would be precluded; it would be powerless against unchangeable conditions such as nature has dictated.

Though the influence upon the growing generation can not be determined with mathematical accuracy, yet the effect of education is powerful enough to reckon with it as a factor in the life of the individual as well as in the life of society. It is an historical force whose effects may seem neutralized at times by powerful influences, but they continue to work below the surface. Luther, despite his revolutionary tendencies, remained a good Catholic. It is known that in later years the impressions of his early education made themselves very strongly felt. Bismarck also remained, despite the revolutions caused by him, a thoroughly conservative man. All great reformers, however strongly their ideas may resemble revelations, derive their ideas from times past, and their early impressions affect their thoughts and actions continually. Thus we see that education does not lose its effect upon a generation which is the bearer of an historical innovation, and wherever it is a question of fixing certain thoughts abidingly in the life of the younger generation, the power of education will be instantly revealed.

Hence it is plain why it is attempted to wrest this important factor in the life of nations from the hands of chance and weave it according to definite principles into a system supported by a unifying spirit which enables it to combine and direct the various processes of education. The first to do this was the philosopher Johann Friedrich Herbart. With him begins modern education in Germany. It walks neither in the tracks of state education nor in the grooves of church education. It is conservative in so far as it penetrates with its roots deep into national and Christian soil and continues to spin the historical thread. It is reformatory in so far as it does not consider good that which exists because it exists, but tries to eliminate from education all the dead issues, everything that is laboriously dragged along as dead ballast by the people. It is the science of ethics which furnishes the standard measure for the decision as to what is alive and what is dead; ethics is truly socialistic, because it attempts to comprehend the life of the individual solely from the standpoint of his living together with others. Whatever in the mind of mankind has gained an abiding ethical value and absolute authority is crystallized around definite

ethical ideas, the realization of which in the life of the individual as well as in society must be considered an unwavering aim of education. By deriving its objects from ethics modern education obtains an aim that is morally necessary, abidingly fixed, claiming recognition through the power of its internal excellence, an aim which will not change under the wavering opinions concerning good and evil, one which will not follow fashionable philosophy blindfold, but outlasts the times, because it comprehends that which constitutes the true value of man's life and points to an ideal which in its sublimity rests upon itself, the ideal of virtue.

The methods which are used to realize this ideal in the heart of our youth are derived in modern pedagogy from the laws of intellectual life; it applies the psychological method in order to gain a reliable, sure way to its end. The necessity of aim and method secures for education thorough freedom—that is, freedom from transient ideals of the time and ever-changing fashions. It places education upon its own basis in a much higher sense than ever before.

Though the aim of education could not be surpassed since the teaching of the Nazarene, it has frequently been obscured, weakened, and suppressed according to the manifold ecclesiastical and secular considerations that determined the leaders. Modern pedagogy has, above all, the task to clearly define the purity and inviolability of the core of ethical convictions, which core has outlasted centuries and determined the direction the development of the human race has taken. In this it is in the truest sense of the word conservative and will not bow to the urging of juvenile enthusiasts, or prattlers without conscience, who intend to dissolve everything ethical in the muddy current of changing opinions of the day. It is reformatory, however, in the search for necessary ways, means, and methods in education. In this it will be the more successful the more psychology follows the development of the juvenile mind, in order to shed light on the twisted paths of the mind's growth. The unification of the whole is secured by the fact that the sublime ethical aim, the fundamental idea of educative thought, forms the center around which all educational influence moves upon the growing generation. The aim of education and instruction is plainly distinguishable, but the dependence of the latter upon the former is also clear, because the end in view of instruction is derived from the aim of education. From the final aim of education is derived the demand for "educative instruction" that does not put into the foreground the mere acquisition of much knowledge, but the awakening of a strong, many-sided interest. It alone is able to give true education, while the former may be compatible with complete barbarism and a certain degree of idiocy. Our schools, which, with their apparatus of periodical examinations and inspections, etc., tend toward an accumulation of many disconnected fragments of knowledge, have been steered into the wrong direction, from which only "educative instruction" can

save them. In addition to this, it must be sharply emphasized that the ideal of education in modern pedagogy is not only an ideal of unfolding of the intellect, but also an ideal of unfolding the disposition (*Gesinnung*). The education of the will is the chief object; intellectual and mental training are merely its servants. Without doubt the will is the most important phenomenon in the domain of mental activity, the highest point of all internal processes, the bearer of the ethical value of the personality. This has become clear ever since Kant emphasized the will, and hence it has become more and more obvious to the educator in what direction his efforts should go.

From a purer, more exact, and higher comprehension of the aim of education results a more correct gauging of the means of education. The Pestalozzian formula, "Number, form, and speech," has lost its power; in its place the history of civilization has become the dominating factor. With that a double gain was secured—the transmission of valuable contents of culture to the growing generation, and a firm construction and an inner connection between the growth of the individual and the growth of mankind.

With this the foundation of personal individuality was laid, an indispensable condition of the development of volition in harmony with character, and now modern pedagogy could approach the problem of framing a course of study that could furnish the conditions of rational intellectual education. This problem could not well be considered until the aim of education had been clearly and precisely defined, and the educational force of history had been plainly recognized.

Starting from the idea of apperception, modern pedagogy attempts to disclose the process of learning according to its true nature, and to follow by immediate application the principles thus formed. In this lies the great practical value of modern pedagogy in real educational work.

Would that it were recognized by all engaged in the education of the people! It would then perform a noble mission in the development of the nation; for, owing to the prevailing evils, a mere increase in knowledge is powerless, yes, even injurious. Engrafting into the hearts of the people pure and beautiful sentiments alone can eliminate or replace that which is distorted and injurious and apt to disfigure the life of the nation at present. To that end modern pedagogy directs all its energy, it being wholly devoted to the ideal of a society saturated with ethical ideas; it attempts, as a means to that end, to reach the ideal of nobler human individuality.

It is true, a system of education, however excellent, will not suffice, for to make it effective in the growing generation educators are needed who are convinced of the truth and grandeur of pedagogical science, and possess the artist's skill in making effective what they intend to have effect. How often have the plans of prominent princes and statesmen been shattered because the executive organs failed to fully com-

prehend the spirit and guiding ideas of the leaders, hence failed to realize them? The ancient contrast between plan and execution makes itself felt also in the field of education. In order to overcome it modern pedagogy has turned to the problem of the best professional preparation of educators and teachers, a question which the old generation viewed with supreme indifference. "Only get knowledge, and the gift of imparting it to others will come by itself." "Only have spirit and you will know how to awaken spirit." These and similar sentiments were heard that arose either from boundless pride or criminal frivolity.

However, the needs of the time make it imperative to call into existence institutions which will promote the preparation of teachers. In establishing such institutions pedagogical considerations have not always been heeded. It was overlooked that the centers of intellectual culture, our universities, should by right also undertake the task of preparing the educators of the people who can not only comprehend the entire organization of our educational system, but also perform the detail work of education with artistic skill and devotion. A false notion of the object of our universities and their duties seems to dim our eyes. In the United States the universities are much less prejudiced in this as well as in other respects. It will not take long for them to surpass us, as they are establishing pedagogical chairs that will consciously, and with well-directed efforts, influence the development of the entire educational system of the Union.

That is the point where we make a mistake. If, however, we notice the progress made in this respect by modern pedagogy in Germany over the views of former times, we may entertain the hope that the future will supply that for which the present lacks comprehension.

With Lessing's theses on the education of the human race, with Schiller's letters on esthetic education, with Goethe's great didactic romances, with Fichte's orations to the German nation, with Herbart's General Pedagogy, a new epoch in pedagogical science has been opened in which the present participates, not in the sense of lifeless erudition which rejoices in the accumulation of printed pages, but in the sense of a living force that permeates the life of the nation and makes its influence effective upon the education of the rising generation.

---

## II.—IS GERMAN PEDAGOGY IN A STATE OF DECOMPOSITION?

The foregoing article on the New Education in Germany is put in bold relief by the following, written by Dr. Friedrich Dittes, the editor of *The Pädagogium*. Dr. Dittes is the author of *Die Schule der Pädagogik*, a great authority on elementary education in Germany and Austria, and it seems therefore proper to hear him in connection with the foregoing article. There is an element of personal regret in his words that may have its origin in the waning influence of Pestalozzian principles and practices which Dittes advocates, but much

of what he says is so eminently applicable to the conditions in this country that a translation of his article is more than justified. This is what he says:<sup>1</sup>

Is German pedagogy at present progressing or degenerating? Looking back upon a half century, during which I have spent my time and strength partly in the study of the science of education in all its parts, and its various historical stages of development, as well as in the study of its supplementary sciences, especially philosophy, while during the same period I have worked professionally in a number of positions with all the intensity possible, I can, alas, give no gratifying reply to the foregoing question. I never neglected to keep an eye upon cotemporary currents and events, while occupying myself with the scientific foundations and the traditional acquisitions of my profession. For the last thirty years I have, moreover, been obliged by literary duties to pay conscientious and thorough attention to all new publications in this field, and even now I have to read a number of foreign and about forty German educational journals, and receive weekly a large number of new pamphlets and books which bear either directly on pedagogy or stand in some sort of relation to it. To look over all this mass of literature I spend several hours a day. I mention this merely to show that I think I am sufficiently informed concerning the present status of our profession. Though in former years I had no reason to conceal my opinions, I scarcely need to give the assurance that now all considerations that might prevent me from giving utterance to my opinion have disappeared. I shall with customary candor do my duty. And now to the point.

In another place I recently published the following remarks:

With reference to pedagogy itself in its entire extent, as well as its supplementary sciences (this word is to be taken in the widest acceptance of the term), I have had no occasion to change my views, although up to the present day I have followed all the accomplishments and movements in this field with the greatest attention and have heard all the clamorous calls for reform. During the last few years various philosophic, natural-historic (especially Darwinistic), physiologic, pathologic, psychiatric, socialologic, political, and other doctrines have been put into play in order to open new roads for the science of education and instruction. Yet the upshot of it all has been nothing else than an announcement of a few well-established truths as new discoveries, and a number of tottering hypotheses, one-sided demands, and obvious nonsense, which all prove that their originators would do well to learn something first before they play the rôle of reformers. For their dogmatic criticism of the old pedagogy, as well as their projects of reform, prove distinctly that they are at best well-meaning amateurs, in most cases precocious smatterers, or bold ignoramuses. He who intends to sit in judgment over a science and give it direction must cer-

---

<sup>1</sup>It is desirable to state that in presenting the views of Dr. Fr. Dittes it was impossible to eliminate the asperities of the author without doing violence to the opinion he represents. The uncompromising position he assumes is in itself a very strong argument and deserves to be retained, especially since the other side is so ably advocated in Professor Rein's article preceding this. Dr. Dittes is by far the most authoritative educator in central Europe, and a statement of the present status of pedagogy in Germany from his pen deserves the most reverend consideration.

tainly be better informed than by a superficial or fragmentary inventory. And as far as pedagogy itself is concerned, this most universal of all sciences can not be derived and construed from the opinions and postulates of this or that specialist, or from picked-up and not even correctly understood fragments of any speculative system, lest one grope from one misleading attempt to another, and finally lose all secure basis. Indeed the bungling work of meddlers in the field of education has already given rise to the opinion that pedagogy is not a science at all, which opinion hits the nail on the head where nothing is known of pedagogy, or where it is made the arena of subjective whims and wild riding of hobbies.

With these words I have just introduced the fifth edition of my *School of Pedagogy*; hence it is easily understood why at the opening of a new volume of this monthly (*The Pädagogium*) I should desire to enlarge upon that text. In their critical garb my words express the decisive reason why, despite my weakened constitution and other considerations, I feel constrained to continue my work as editor, though I would willingly lay down my pen if I saw pedagogy in a healthy state of development.

That is not the case. Externally, yes, it has grown beyond its former limits. There are at least a quarter of a million of persons of German nationality occupied in the profession of education and instruction, and among them there are thousands who do not only practice pedagogy, but have the earnest desire to reform and develop it, who, however, think their practice too insignificant for their talents and seek their life's object in reform. Among them are many who, conscious of their epoch-making originality, entertain the idea that they could do without an earnest study of professional literature, and yet pronounce a decisive judgment concerning it. This judgment invariably reads: "All of the old pedagogy is worthless; it is merely a collection of vulgar opinions, groundless assertions, arbitrary regulations, trivial recipes of schoolmasters, etc. The founders and coryphees of the old school did not understand anything; they have been surpassed and pushed aside by the great progress of our age; they must be thrown into the rubbish chamber with all their worthless trash, so that the needs and demands of the present day can be heard and heeded." Therefore we see springing up reform magazines, reform articles, reform pamphlets, reform books, and no end of them. I may safely say more of them would see the light of the day if only the publishers could properly estimate the works offered for publication and could pay for them, or if publication at the cost of the author was not so expensive. These latter reasons combine to let so many hopeful authors leave their new roads unconstructed, or see their plans despised by an ungrateful public. I have often been obliged to deny my assistance as an accoucheur for these original geniuses, and have harvested ingratitude, although I can candidly say that this ingratitude is more pleasing to me than the consciousness of having aided in populating the pedagogical field with monsters.

Outside of the circle of representatives of our professional science, also, there is at present a large number of workers and reformers who

chiefly act as amateurs, but, as a rule, have no smaller opinion of themselves than the aforementioned class, and think that they tower above them in possession of science and brains. Among these we find some university professors and some who would like to be; for instance, philosophers who think they have discovered a new principle that is likely to aid the perplexed science of pedagogy as a guiding star; or medical men who work in school hygiene, neurological and clinical specialties, psychological investigations, "psychopathic deficiencies," doctrines of heredity, etc. Furthermore, writers of fiction and other polite literature, who partly utilize in belles-lettres what new and sensational ideas the aforementioned authors publish and partly draw upon their own accumulation of imagination and truth, and who write works of which they claim that no teacher should "leave them unread;" also journalists and other free lances who intend to point out the way to education from still other standpoints—political, social, economic, and Heaven knows what.

In short, pedagogy has doubtless increased in horizon and extent; but what about its inner value, its fundamental basis, its harmonious structure, its convincing power? Are these attempts at reform at present to be reviewed as progress or retrogression? Indeed what is this most modern of all modern pedagogies at the end of this nineteenth century? It is a Proteus assuming daily new forms, difficult to grasp, because he knows not himself what he wants. Only one thing is repeated again and again: "Everything old is worthless, something new must be produced at any price." Reasons seem to have no weight, either in rejecting the old or in creating the new. Sense or nonsense is all the same, so long as it offers something different from what there was, as it suits the character of Proteus. Of course anybody can play that rôle, because without professional knowledge anybody can speak and, in a measure, may be justified from the standpoint of individual autocracy.

A few examples may show the results of this kind of reformatory activity. We shall select mainly works which prove a partial familiarity with the subject and an independent conception, leaving out of consideration all that literature which shows after a brief examination that it is void of inspiration and deserves an ignominious death in the wastebasket. Let it be said emphatically that in rejecting erroneous projects of reform we do not wish to injure their author's positions or their other literary works, since several of these gentlemen have furnished estimable productions. It must be understood that it is not our task to rescue traces of good work and place such work upon a sounder foundation, but to demonstrate the destructive tendency of feverish attempts at reform and progress.

A few years ago a university professor made the remarkable discovery that all the pedagogy of former days suffered from the fundamental error that it was purely individual pedagogy; that kind of education had lived to see its day; our time needed a new, that is to say, a social

pedagogy. Immediately this great reform idea was elaborated and commented upon in various educational journals. At first I was very much astonished over the announcement of this discovery, since not one noteworthy educator was known to me who had regarded the child solely as an individual, and not also as a social being. It is generally understood that even Plato and Aristotle emphasized this point of view, and nearly all the classic writers upon pedagogical science have done due justice to it. Exceptions are Locke, Rousseau, and Herbart, who practiced "tutor pedagogy," and considered and treated the pupil chiefly as an individual, without, however, ignoring on principle his social destiny. But the discovery had been made and was faithfully repeated. It was especially aimed at Pestalozzi, who was denounced as the antisocial educator of our era; hence that he was worthless. And that was said of him who, above all, had so warmly and emphatically pleaded for the social importance of education! How was this riddle to be solved? Easily enough, for it was merely a confusion of ideas on the part of his persecutors. These gentlemen did not understand by the term individuality that which is generally understood in pedagogy, but its very opposite, namely, the typical in man, the generic character of the human being. That Pestalozzi, together with Rousseau and Kant and others, had been sensible enough to admit that the child should be, above all, a human being, possibly a complete, entire man, developed in every direction of his inborn capacities, if in future he was to be an honored member of society—that Pestalozzi saw in general human culture the foundation and presupposition of all special professional education, is a thing which to-day is considered an old-fashioned folly, for it is thought now that the human being possesses value only in so far as he serves the state, the church, and society, or certain interests of a social class and profession, and he is to be drilled *ad hoc* as early as possible and restricted within a very small horizon of knowledge and duties. Nobody, it seems, is allowed to be a whole man; that is to say, a man who is something for himself; he is to be only a fragment, a stone in the wall, an available material, a useful tool, a member of the serving or ruling strata, a laborer, an officer, etc.; but not a man, for such a thing does not exist any longer; that is merely an abstract idea, a phrase, a cosmopolitan fraud.

Another university professor has found "that Pestalozzi had arrived at no inconsiderable errors by his exclusively speculative presupposition of a fundamental difference between the sensual nature of the animal and the transcendental nature of the human being." Well! Pestalozzi and exclusively speculative presupposition—that is indeed a new combination. Those familiar with Pestalozzi know nothing of it, and they would like to hear from the Professor what errors they were into which Pestalozzi by his exclusively speculative presupposition had fallen. Probably he had refused to do reverence to the fashionable "Monism," like that other famous Swiss who refused to bow before the

hat of the governor. But this professor himself announces as the fundamental demand of his reform plan that we must recognize "psycho-physical parallelism." He ought to know from elementary mathematics that for any kind of parallelism there must be at least two lines or planes; nor can he deny that there can be no psycho-physical parallelism if there are not at least two kinds of phenomena as objects of the investigation, namely, the facts of external sense perception and the facts of self-consciousness. It is not a question of an exclusively speculative presupposition, but it is a plain question of facts. Moreover, the aforementioned parallelism, as far as it is demonstrable, has long been recognized in popular view, as well as in science, sometimes even, as with Spinoza, in an exaggerated manner. The science of pedagogy has always recognized and appreciated it and did not need a new revelation in this direction. The Professor furthermore informs us "that education must not begin with the formation of ideas, but with the correct selection of stimulants" from which would result "the correct sensations and representations in the memory." This may be to him a new discovery. Educators knew it and practiced it and found it applied in the best manner in the work of Pestalozzi and all the most noted psychologists of whom the Professor does not even seem to know the names. We might do without his ideas of reform, for that which in them tastes of originality—his assertions concerning the processes going on within the skull—is something which he had better submit to the approbation of his special colleagues. Pedagogy has at present no use for it.

A young doctor surprised us with the brief declaration that "pedagogy as a science is a conquest of our era;" and then he proves at length that there is nothing in this conquest of our era. This apparent contradiction arises from the fact that the doctor has in mind only the pedagogy of the so-called scientists, which, it must be admitted, is a conquest of our era, and a very puny thing at that. Formerly it had served our doctor as wet nurse, but now he turns away from it, because it is only "that which schoolmaster pride calls scientific pedagogy, and because it has fallen into discredit with the most noted representatives of science; that this was the cause of the fact that people did not any longer wish to hear anything of pedagogy as a science." That is certainly correct, but that there is another and older pedagogy of scientific value seems to be unknown to the gentleman; naturally, for in his own school he had heard nothing of it, hence he argues:

The present has no scientific pedagogy, neither had the past any, consequently it must be expected from the future, and it must first be created. For that purpose a combination of pedagogy with psychology is to be established, of course, with modern psychology. Others had thought of such a combination before, but useful books in this sense had been wanting almost entirely.

Thus speaks the gentleman, of course, because in the inventory of his school he had not found anything suitable for his purpose. Hence a reform must be inaugurated, or, as he terms it, a new formation from

the very foundation upward; that is to say, starting with the aim of education that must be decisive for the entire science, an aim that has not been correctly understood heretofore. Again, this aim must be modern—that is to say, the educator as well as the pupil must be guided by the view of the world, of his nation, and his cotemporaries with reference to ethics, economics, and politics. Concerning the ultimate end of all human aspirations and actions, the relations existing between us and the universe, between us and the fundamental principle of the world, “everyone should have a completely rounded-off view, so that man should do everything in the service of the absolute, and consider himself the bearer of a higher idea and the executor of a divine will; yea, actually, at all times be a part of a world-immanent divinity wrestling and contending under many modifications.” This modern view could, of course, not be determined by any individual, but must be only a sum total of “scientifically examined and well sifted” results of investigation concerning which “speculative philosophy” alone should decide. It may be rejoined that in speculative philosophy there are just as pronounced contrasts as there are in the opinions of the great mass. This fact the doctor seems to have overlooked. However, for the actual world he proclaims the “variability of views”—again a genuinely modern idea; but in things metaphysical, absolute, transcendental, and incomprehensible everything is to be philosophically determined and fixed. For this purpose, I think, the authority of this doctor will not suffice, and humanity will have to wait until the end of its days before it will get a pedagogy, if it is to wait for the determination of its aim. Analogous demands have never been put to any other science; indeed, there would be no science if it had heeded any such demands.

Should this young doctor try his hand at it, others will comfort themselves with the conviction that he will never succeed in producing anything of lasting value. Human reason does not suffice to solve all these problems that are now placed as traps at the gates of pedagogy. Every new attempt at overturning, by means of metaphysical dogmas, the iron-bound limits of our understanding will end in disaster. For what should we have to expect if once again, by means of some power, the mania would prevail that man could actually combine and identify himself with the origin and fundamental principle of the world, could consider himself as the executor of divine will; yea, a part of the Divinity? It would not be the first time, for it was done during the Middle Ages, and it has cost countless victims of torture and the stake. It is true there are even to-day people who would revel in the most frightful fanaticism if they only had the power. But is pedagogy called upon to serve these people? Doubtless the doctor has found in his former school enough of such fanatics; unfortunately his leaving it has not freed him of the poison it instilled in him. To adorn blind self-aggrandizement with a nimbus of erudition is doubly dangerous in our days, in which upon every curbstone the gospel of modern superhumanity is

chiming in with the battle cry of the soldiers of the cross of the Middle Ages. One may class this among the many excrescences of the *fin du siècle*. I for my part confess that I have not the genius to appreciate it, and that I am still standing on the narrow platform of Goethe, the man "so poor in spirit," who "has been shoved aside," who said, "With the gods no man should dare to measure himself." I hold that man should not want to know more than he is able to know, and he should certainly not, with his foolish, impotent plans, consider himself the executor of the divine will. We should advise him whose natural sense does not tell him, if he has a strong mind to apply the art of an ancient pioneer of the German mode of thinking, a good, strong dose of Kant's critique, which, alas, does not any longer seem to be in favor among modern speculative thinkers.

If thus far pedagogy "from above" is promised from the highest pinnacle of speculative philosophy, and a view is opened from the theology of revelation, we now turn to another reformer. This time not a professor nor a doctor, but a very fertile spirit, who is ready to present us with a pedagogy "from below," as his inventive genius terms it. People acquainted with the catchword will know that we have to deal with an apostle of children's psychology—child study. He is a genuine councilor of confusion, and it is not to be wondered at since he claims to belong to the "scientific pedagogues." With the well-known scientific accuracy and love of truth, he claims for those engaged in child study the merit of having shaken the omnipotence of the Socratic or catechetical method. As is well known, Pestalozzi has done that in a more satisfactory manner. Then he proclaims a principle, and a thoroughly scientific one it is, as he says, by asking: "How does man develop, and what must, therefore, be offered him?" And he simply refers to the probable foundation of Ziller's theory of culture steps, while this educational theory had found its most renowned adherents in Comenius and Pestalozzi. To do justice to these masters, however, does not seem fitting for the presumptuous bungler, lest he would have to recognize in the theories of these masters something "thoroughly scientific." With the same accuracy with which he sketches historic momenta, our pedagogue "from below" constructs the theoretical foundation of his project of reform. He speaks of "faculties" which the educator may train. His chief authority, however, is Herbart, who recognizes no faculties, hence no training of faculties. We see, then, that he frames a doctrine diametrically opposite, according to which everything is inborn. He is ready *cum grano salis* to assert "man is perfect when he arrives in this world." This is to mean that the baby possesses the beginning of everything, and this is what the gentleman calls "thoroughly scientific." Our pedagogue "from below" lays special value upon the views of children, for his watchword is, "I go to school to the child." The ingenuous reflections concerning stories, such as the Seven Little Kids and The Bremen City

Musicians (see Grimm's Fairy Stories), as he tells us, he has directly from the lips of his pupils, which proves that he has very good guides in his child-psychology, for these children know, also, that these stories are merely composed so "that they should have something to read," and they tell him, also, "how these stories could be immensely improved." Experienced people will of course doubt the fact that this wisdom of childhood is purely the result of the genius of aspiring youth, or whether it has not been the result of adult influence, whether it was not prompted. This is a doubt which has at least as much justification as our reformer's doubt in the reliability of the material collected from the psychology of children by other people. In fixing the simple data from the development of the child's soul, the greatest care and circumspection is necessary. How much more critically must one proceed, as our pedagogue "from below" does, to make the expressions of precocious children scientifically applicable! The fiction writer can form the types of his children as it pleases him; the educator must use the greatest moderation, and if he, like our reformer, would use fiction, he would have to distinguish carefully between poetry and truth, a fact to which the "ancient Goethe" called special attention by the title of one of his works. Otherwise it might happen that an educator would get the reply from a boy who has been made a literary source, that his father had just composed or rhymed together a sort of a story of his course of development. Now, think of being called upon to listen to the precocious remarks of juvenile philosophers with respect and approval! This is pedagogical folly.

The renowned "scientific" pedagogy is sinking indeed lower and lower. It began with drilling unripe youths into bold, presumptuous prattlers, and now it intends to make the A B C pupils professors of teachers. It will not take long, and children will assume the professorial chair and the teachers exchange seats with them. That is the true "pedagogy of the future" imagined by our author who prattles of a pedagogy "from below" worthy of the science of our day. Truly modern is this, and perfectly in harmony with the spirit of the time, which is also working in politics and religion by allowing the uneducated majority in noisy mass meetings to reveal to its honored candidates how they shall legislate and act, while the candidates flatter the dear "voting cattle" with sweet words, or while the fanatical disciples of "fighting ecclesiastics" demonstrate in denominational congresses which is the true faith and the inalienable right of the church. All this is done so that the government and public authorities may hear the voice of the people and read in it the voice of God. This is similar to "modern" science, and, above all, to pedagogy "from below," which is to be reformed by children and ignoramuses.

Our author acts as though child psychology was entirely a terra incognita and had to be discovered from its first elements. He asks of his colleagues that they should, according to a plan agreed upon, note

down what things interest children and whatever else they may observe, so that "from the aggregate may be deduced that which is typical;" or "everyone should publish independently what he has found." Unfortunately many good, successful teachers withhold their valuable experiences; possibly they are those who do not think it practical to repeat ever-recurring trifles in unending variations, men who remember the classic words "Seek honest gain, don't be a fool who tinkles with his bells." Yet, this is better than the publication of speculative "experiences," the authors of which claim to be the discoverers of typical stages in child psychology. Our reformer interests himself, for instance, in the question, "At what age do children begin to criticise fairy stories?" By which we suppose he means, begin to doubt them. He answers the question, "According to my experience this takes place at the end of the eighth year of life." Well, well, well! Why not in the middle of the seventh, or at the beginning of the tenth year of age? That depends entirely upon the individuality of the children and upon the special circumstances of their education; precisely as in one place the inventory of concepts of a 6-year old child is not necessarily the same as it is in another place, because the objects and phenomena in the horizon of the one child are different from those of the horizon of the other. He who intends to construct an inventory of typical concepts that holds good for all cases—in other words, he who will construct a child psychology according to a given pattern, simply proves that he does not understand anything of psychology at all. That which in the development of the child's soul, and in fact of the human race, is typical has been clearly and distinctly proven long ago, and every true psychology is at the same time a child psychology, because without knowledge of elementary development of the soul the comprehension of a higher mental life is impossible. It is precisely in this as it is with the sciences of the organisms of external nature, which must not ignore the embryonic manifestations of life if they wish to understand the sum total of development. But for that purpose there is not necessary a special botany of nurseries, neither a special biology of chicks, nor a special psychology of calves. But our pedagogue "from below" does not know what he wants; he has not learned anything of noted promoters of child psychology, of whom one may enumerate more than a dozen; hence he comes to the conclusion that up to the present day we know nothing and that all is a chaos, in which statement, as far as he is concerned, he is perfectly correct. While thus declaring that his pedagogy "from below" is still in the far future, he guides his little ship back into the safe harbor of the Herbartians, who build "from above." We are inclined to wish that he would stay there and complete his inventory before he enters upon new adventures. That will save him much useless trouble and would secure well-earned stability to the pedagogy "from above." That school begins in canonic manner

with a simple being, granting it five ideas, six kinds of interests, and speaks of the strength of ethical character, of government, discipline, and instruction, of apperception and concentration, of culture steps and formal steps, of analysis, synthesis, association, system, method, and other furniture that has been used with comfort and facility before. It is easy to continue this *ad libitum et infinitum*, till doomsday without any practical result whatever, yet such talk will create the satisfaction of being a "thoroughly scientific pedagogue," and secure a numerous crowd of disciples, for the race of those who would like to become "scientific" in the most comfortable and cheap manner possible will not die out readily; nothing can be cheaper than the fee which admits to the chosen circle of the so-called scientific pedagogues. If, however, a profane Mephistopheles asks: "What kind of stew are you making?" they may give the classic answer: "We are cooking three beggar-soups," whereupon the comforting assurance may be given: "Then you will have many customers."

This stew is quite prickling to the taste, and now and then it induces habitual guests to an analysis of its ingredients; especially the noted "interest" enjoys thorough investigation nowadays; and a German normal school principal has recently devoted a whole book to it. As an independent thinker and principal opponent of Herbart's theory, he treats this fashionable article in his own inimitable manner; but it is difficult to see how the science of pedagogy can be enriched thereby. It is true one can crowd almost everything into a treatise the subject of which is a catchword. The title "Psychologic-pedagogic monographies" is elastic enough to admit subjects like interest, concentration, apperception, memory, imagination, will, ethical character, etc. They can be placed in the focus of psychology and pedagogy, and yet in ever-recurring repetition mean essentially the same things; but in so doing the authors often tear asunder the elements of science—that is, they place them out of their generic connection and confuse them, partly overlooking or undervaluing, partly violently stretching and adjusting them, as though they were to fit a Procrustean bed, all for the purpose of fitting them to a pattern. In this manner the entire science of pedagogy gets out of plumb, it loses its symmetry, and while some of its departments lie fallow, others exhibit luxuriant but sickly growth. One of these subjects is the frequently discussed interest, a dropsical, swollen oaf among the psychologic-pedagogic concepts. The older theory of education sufficiently considered that which is designated by this term. German pedagogy did not need to wait till by means of a high-sounding technical term a new world should be opened for the wonders of which the mother tongue had no name. And instead of courting this suspicious bastard that at first bore the recommendation of being opposed to all eudemonisms, yet identifying itself more and more with the most outspoken egotism of modern interest hunting, it would seem to be timely to speak a little more of duty and honor.

It is actually nauseating to see our children listened to to find out their interests and to instill in them for the future nothing but interests. A smart reformer, also a German normal school principal, has moved a step forward. First, he proclaims the principle: "Our common schools must be institutions for training above all." That we all knew long ago, and no one had taught it better than Pestalozzi, and the common school was an educational institution as long as Pestalozzi and his disciples were appreciated. But now it is to win its highest triumphs in being lifted by interest-mongers upon a higher plane. Already the idol of six heads is not many-sided enough. The priest just mentioned has increased the number to nineteen different kinds of interests, and adds complacently, one might easily find another. The entire matter of instruction in the common school is henceforth to be selected and arranged exclusively according to these nineteen interests, which our reformer presents in an elaborate plan. This he claims to be the ideal of a common school. Finally, he remarks: "If, for the purpose of accomplishing this end, I have sometimes used other means and ways than other people, it must be remembered that the world is mirrored differently in different heads." There, that's the thing; that's the characteristic sign of our times and an inborn fundamental right of the modern race. Every individual has the right, from childhood up, to think and to will to please himself, and if you demand anything of him you must make it suit his interests, of which there are nineteen kinds, by the way.

This autocratic tone becomes more emphatic in another reformer of pedagogy, who declares without reservation: "The firmly grooved systems of thought acquired during my school time have fallen apart" (he formerly belonged to the scientific pedagogues and had "published something" for that school), "and upon the foundation of my original ego has arisen a new, free life of thought. I now feel that I am a world of my own." That's worth hearing. Respect for such an autocrat!

There are also reformers with less radical demands who might be easily dispensed with, since they merely proclaim as new ideas truths that have long been known, and who shine chiefly by making erroneous additions and arbitrary changes in technical terms of the language, thereby adding to the confusion of the pedagogical train of thought. Thus we read in an educational journal:

Much weight has recently been laid by renowned educators upon the demand to give children a thoroughly modern education—that is, the children shall grasp psychologically, and not only mechanically, what they learn.

That was not only said recently, but has been recognized and demanded by every noted educator of the past, only instead of the badly fitting, though scientifically sounding, word "psychological," the term "self-actively" was used.

Again, with the word education they did not merely mean learning, although the past master of the scientific pedagogues declares to have

no idea of education without instruction, while the vulgar pedagogues entertain such an idea.

Another voice is heard saying, "In education the laws of development of the human nature must be heeded," and then this selfsame voice recommends authors for whom laws of development in human nature have actually not been in existence. However, that this is a very old and well-established principle of pedagogy scarcely needs to be said, if it was not for the fact that ignorance is most decidedly modern. Then, again, we hear some say, "Everything is to be done according to psychological laws," and others "Everything according to physiological laws." Both parties would do well to agree upon an equitable distribution, so that there might be something left for other laws. "Anthropology must be pressed into the service of dietetics and hygiene." "Anthropology and hygiene should be related to each other like cause and effect." Very well, gentlemen, only permit us to say that these are well-known commonplaces.

Often a more high-sounding catchword is sufficient as a basis for a reform. To the one a new light has arisen because he has succeeded in understanding the word evolution, a term for which we formerly used development. To another, because much is said of "dispositions" nowadays, a term for which we formerly used "faculties." "Natural" education furthermore is considered of great prominence over "education according to nature's laws;" and a pedagogical lecture, so the report says, created a sensational applause because the lecturer reproduced a few generally well-known rules of didactics under the captivating title, "philosophy of learning." With these tricks of legerdemain some reformers exhibit such satisfaction that one would think they had at least invented the differential calculus or the electric light.

From the foregoing we can plainly see that this senseless chasing after educational reforms causes among these numerous adventurers irreconcilable contradictions, and confuses ideas that should be perfectly plain. Only one more specially flagrant case of this kind may be emphasized. It is the contention concerning ethics. For "whole and half-sized Titans" ethics is not in existence any longer, it is merely a ridiculous fairy story; for speculative investigators in the realm of the absolute and other equilibrists it has merely a relative value, while for the so-called scientific pedagogues it still is the alpha and omega, the only guiding star and end in view of education. Of these theories the last-named has been put into circulation as a radical reform idea. All instruction, that is to say, also nature study, universal history, geography, the explanation of reading matter, singing, etc., shall have ethical education in view. This exaggeration and one-sidedness, according to which all matter of instruction is to be cut and applied to suit ethical reflections, naturally blunts moral feeling rather than animates it. To judge from the noise made by the cry, one would be justified in thinking that the art was found at last by which the pillars

of ethical order of the world could be deeply and unshakably embedded into the soul of every child, and hence also into the soul of the people; by which action society, state, and church are forever rescued from decay. However, the work of reform has been going on for over a generation, and yet no result, nay, not even a beginning of a result, can be seen. One may place at every proper and improper occasion strength of ethical character as the only aim in education, and enumerate from five to nineteen kinds of interests, it will ever make the impression of self-sufficient pharisaism, which exhibits before God and man a whole register of sterile virtues, and thereby crops out on the one side ethical casuistry, on the other side contempt of all morals or their reduction to mere means in the battle for existence. And thus the fight goes on, the confusion increases, and instead of the motto, "The aim of nature study is ethical education," a younger section of the party already twists it into, "The aim of ethics is recognition of nature." Perhaps they will soon find that all treatises on pedagogy might very well be replaced by a text-book on cattle breeding. One extreme seems to bring forth the other, and since every subjective visionary, despising the reign of critical thought, claims equal right and the privilege of personal liberty, all possibility of coming to an understanding concerning the theory vanishes, and with it the art of pursuing the profession of teaching.

In order to keep the trade going, despite this confusion of leading ideas, numerous carters haul new material that is to be distributed by diligent teachers among children eager to learn. There is another and very extensive species of pedagogical reform literature, namely, the one which works according to the principle "cheap and poor." Its titles are guides, manuals, materials, elaborated courses of study, preparations, model lessons, etc. Such labors have full justification when they are performed for students of normal schools by real masters of practice, but when they are compiled by bunglers, with criminal carelessness, and offered to teachers of long experience as "easy roads" they become pons asinorum, about which one is in doubt whether they derive their name from their architects or from the people who pass over them. The ready sale which such works find at present does not throw a favorable light upon the professional education of teachers, since it proves that many of its members do not get their matter from scientific sources, but obtain it in rations from bunglers' compilations, and moreover, that they constantly need methodical aid. Looking over the entire pedagogical literature of the day, a large part of it makes the impression that the opinion is prevalent that he who can read and write is called upon to act as author.

Under such circumstances we need not wonder that an anxious educator says:

I am astonished that, despite all the accusations brought forth by the reformers and despite all the reform projects advanced, no improvement is shown anywhere.

Our educators [he continues] seem to suffer in recent years of the writers' fever, for everyone who has grasped a new idea (new, of course, to him) seems to be impelled to put it on paper, in order to furnish a contribution to theoretical and practical, pathological and psychological pedagogy.

And in his holy anger over this confusion he cries out:

May our learned and pedagogical leaders give us at last a solid, unified system of education, quite immaterial whether it is according to Herbart, Diesterweg, or anyone else. Give it especially to the common school, an edifice which stands unshakable and which will hold out against the most cavilous pedagogical attacks.

To be sure, when year after year the degenerate race of our days throws mud upon the master works of its great ancestors, and again and again proclaims that it has overturned these master works; when the thoughtless public believes these boasters and allows itself to be led by the nose by every new prophet; when in the realm of the spirit anarchy becomes epidemic—then every friend of well-systematized action would be satisfied with any system, provided it could stand. But whence shall such a system come, and how can it be secured against attack in this interminable wrangling that reminds one of the Babylonian tower?

It is never well when a nation suddenly leaves the tracks of its cultural development and either throws the precious inheritance of its fathers wantonly through the window or apathetically leaves it lying in the corner. Then periods of degeneration and decay will occur, such as German history records in the tenth and eleventh, in the fourteenth and fifteenth, and again in the seventeenth century, and finally in our own days. Happy is the nation which in such periods retains a sound core of people who love to think of their ancestry, who lovingly keep the tradition of their ideals, maintain the procession forward and upward, and see to it that under more favorable circumstances sooner or later a renaissance of the whole nation may take place. Our German nation has had several of them, and it is to be hoped that it will have another in the future. The glory and greatness of our nation during the nineteenth century has been caused by powerful impulses which it received from the master works of its great thinkers and poets, either immediately or through the aid of popularization which made common property of the foundations of a high-minded mode of thinking, of a flourishing culture in all domains of the national life, and of a triumphant development of the power of self-preservation. These guiding stars of all higher aspirations have been followed by German pedagogy, partly by examining the most distinguished ancient and foreign works concerning education with newly gained standard measures and ideas, partly by self-active remodeling, as was done by Pestalozzi and his school. All great systematic pedagogues of Germany, quite immaterial whether they were Protestants, like Niemeyer and Schwarz, or Catholics, like Milde and Sailer, were one in their enthusiasm for our great thinkers and poets, in whom they had clarified and improved their own minds and had warmed and exalted their hearts.

When men of this kind promoted German pedagogy, it had a scientific character, because these men had themselves a solid scientific education, and therefore worked scientifically. But since some scientific swindlers have assumed the rôle of prophets, and collected around themselves a number of unripe youths and drilled them into bold charlatans, shameless defamers, and servile mercenaries, scientific pedagogy has become an object of mockery and scandal, of which the worst is not said when it is likened unto a traveling menagerie before which screaming parrots hang on chains in order to allure the public to enter the tent, so that they may see the antics of the trained buffoons. But when this race of pigmies has the insolence to brand the entire older science of pedagogy as trivial and vulgar, it is not aimed at Pestalozzi and his school only, but also against other educators whose systems are related to his. Likewise is it aimed at Kant, the inexorable critic of all scientific illusion; therefore against all profoundly thinking philosophers, as well as against Lessing, Goethe, Schiller, and all other great lights of the nation. It seems quite natural that the great must be pulled down into the dust so that the pigmies may rise. Formerly the rule prevailed, "judge not things of which you understand nothing," but for these modern original geniuses that rule belongs to the recipes of vulgar schoolmasters, recipes that deserve to be thrown into the pedagogical rubbish chamber. What could a genuine original reformer say if that ancient orthodox rule held good for him? To enter upon a profound study of the classic writers of our profession the younger generation has not sufficient brain or diligence, and they have an instinctive horror of that kind of study, because they suspect that under a single step of one of such giants of the spirit a whole swarm of one-day flies will be killed. May they try to make the world happy. Within the present century the German nation has performed great deeds with that spirit which is derived from "vulgar" sources. Let us hope that in future, amid new dangers, a greater race will accomplish greater things. We men advanced in years may go to rest with good consciences. *Vivant sequentes*.<sup>1</sup>

Meanwhile the new way of salvation is only in the first stage of fermentation, and therefore let us use our power in order to check by an occasional warning word the frenzy of unbridled passion for reform, and remind the profession of the inalienable foundations of a prosperous development of culture. For there is danger that the wild currents of the time, acting destructively upon thoughts and aspirations and incapable of actual creations, will contribute toward strengthening reactionary movements, which are at present already actively promoted by church and state authorities. The aim toward which reactionary

<sup>1</sup>Dr. Friedrich Dittes, the author of the foregoing article, died May 15, 1896, in Vienna. He was for many years state school counselor in Gotha, Germany, and principal of the city normal college in Vienna, Austria. He was a most influential member of the great German Teachers' Union and exerted a powerful influence over the educational efforts of every German state.

powers and anarchistic agitation hasten has been characterized by a thoughtful observer (Tacitus) who meant it for another period when he said: "Ruere in servitium!"

Though it may seem useless to trouble one's self to oppose the current of the time, yet an honest man perceives it to be the command of duty to withstand indefatigably that which he considers foolish and destructive, and to defend steadfastly that which he considers true and good. Such a combat is not by any means hopeless. There is a sound core of men in the German nation and among German educators who will not consider servitude under the public authority, an authority that crushes all personal individual life, as a fundamental condition of general welfare and an indispensable presupposition of every science, nor will they consider the restless play of the waves of individual arbitrariness, but will insist upon freedom under the laws of reason.

### III.—SUPPLEMENTARY AND INDUSTRIAL SCHOOLS IN GERMANY.

#### INTRODUCTION.

The article on the schools of Berlin published in the last Annual Report of this Bureau confined itself to elementary or common schools that accommodate the children of all strata of society between the ages 6 and 14. Secondary schools as well as institutions for industrial education are not mentioned. In the following an attempt is made to sketch the efforts made in Germany, and particularly in Berlin, to further prepare for the duties of life the children of the poorer strata of society, after they have completed the course prescribed for elementary schools. Berlin sets an example for the whole Empire in establishing a system of supplementary or continuation schools, as well as schools in which trades or, generally speaking, industrial pursuits are taught. These institutions are the result of the widespread conviction that preparation is necessary for every kind of work, and the frequency with which skilled labor is found in Germany bears witness to the good result of the institutions mentioned which have enlisted the attention of educators far and near.

That this kind of educational instruction becomes more and more desirable for this country may be seen from the following quotations. The Literary Digest, commenting on the scarcity of skilled workmen, recently said:

In view of the lack of employment which, even in "good times," compels thousands of workmen to lead a life of enforced idleness, and of the attempts made in several States to provide this "army of the unemployed" with work and wages, it is surprising to learn, on the authority of the Iron Age, that the increasing activity in the iron and steel trades is developing a scarcity of skilled workmen, and that the supply of fit men is steadily growing smaller. In some branches of these trades, we are

told, considerable uneasiness is now felt over the outlook for the future, and this is especially the case in those lines in which a long apprenticeship is required. Regarding the causes of this scarcity, the *Iron Age* says:

"This is one of the inevitable effects of a protracted season of dullness in a trade. Good men are the least disposed to remain unemployed for any length of time. Preferring to continue in the occupation for which they are specially fitted by reason of their training, they will perhaps await for a reasonable period the resumption of business in the establishment in which they were employed, but when day after day passes with no sign of starting they turn their attention in some other direction and accept the best chance offered. Some take such money as they have saved and embark in business for themselves. In a few months after a concern closes down its organization is scattered to the four quarters, and the same men can not possibly be collected. A large percentage of them has drifted into other trades, and either will not or can not return to their old occupations. It might be supposed that the introduction of so much labor-saving machinery in iron and steel works, which has been a conspicuous feature in recent progress, would go far toward throwing on the labor market an oversupply of workmen, but these changes after all have not been so far-reaching as the complaints of labor leaders would have us believe. Like all other movements in the direction of progress, their effect has been temporary, and the displaced workmen have evidently found other occupations. The question can be pertinently asked: If old methods were still in vogue in our great iron and steel works, how could a sufficient force of skilled workmen be obtained? It now appears to be absolutely necessary to devise further means of conducting manufacturing operations by labor-saving machinery if the supply of workmen can not in some way be augmented."

Not only are skilled workmen scarce, but it seems that there is an absolute dearth of qualified men to direct departments in manufacturing establishments. The *Iron Age* says:

Our mechanical progress appears to be developing at a rate of speed out of proportion to the conventional methods of preparing men to fill the exacting duties now required of them. Within the past few years new industries have grown at a marvelous rate, which have made heavy drafts on the ranks of those who either were or were apparently destined to become leaders in the older industries. Opportunities for more rapid advancement or for better financial returns have been seen in the electrical business, in the tin-plate trade, or in the manufacture of bicycles or some other comparatively new line. Again, the growth of old works has advanced men of ability in department work to positions of more general supervision, and vacancies have thus been created which are hard to fill. Some of our largest manufacturing companies, who from their position would appear to be well equipped with a technical and practical staff of the most ample proportions, are constantly on the lookout for men of ability and practical and scientific knowledge to fill positions of the character above indicated. Of the mediocre or unskilled we shall probably have no lack, even if a much greater condition of activity should be favoring the iron trade. The tide of immigration is again turning toward our shores, attracted by the reports of improving business. But the highest grade of workmen can not be recruited from that source. It must essentially be a home product, trained in American methods, dominated by American ideas, and gifted with American ambition.

Discussing the facts brought out by the *Iron Age*, the *New York Evening Post* declares that the situation can not be adequately explained by temporary dislocations of labor, but must be referred to more permanent and general causes. It expresses its own view as follows:

In the light of such confessions the old proverb, "There is always room at the top," might be reversed into "There is no room at the bottom;" and this, indeed, is the commercial situation to-day: There is but little room for the incompetent, the

ignorant, or the lazy in the ranks of those employed by our large corporations. We have no lack of unskilled laborers, but, unless all industrial signs fail, these must take a place in our civilization even lower than hitherto.

This demand for better knowledge and greater skill is one which is common to all trades and professions. The poorly equipped physician or lawyer is less and less in request. In conducting large enterprises, the capable manager finds his services more and more in demand and commanding higher rewards. In this compulsory advance toward greater excellence, education plays an important part. The Pennsylvania Railroad has long held to the policy of requiring the young men entering its mechanical departments to have some technical training, both in theory and practice. The technical colleges supply a part of this requirement, while not a few men, particularly in the newer sciences like applied electricity, are pioneer discoverers by right of research and study. Everywhere it is the same; the professional or business man, as well as the employee, to succeed in modern commercial strife must have all the resources which knowledge and training can give him. \* \* \* The dearth of qualified experts and the scarcity of skilled workmen in the iron and steel trades are indications at once of the new demand for more efficient laborers and of the opportunities thus offered to the deserving.

Considerations like the foregoing make it appear desirable to see how in Germany this question was faced. Authorities agreed that the excellent results of the French textile industries, and the great value of the product of French art industry, were not owing to the great innate talents of French laborers, but to their thorough and very appropriate schooling in labor. This special education "ad hoc" has been going on in France from the time of Colbert, the minister of finance during the reign of Louis XIV. Indisputable proofs of this were furnished by the various world's expositions, which opened the eyes of intelligent men to the great inadequacy of the institutions for industrial education prior to 1870, and it may be said that German industry thereupon took an upward start most gratifying in its results, since it was consistently planned and aided by the establishment of a large number of institutions for technical and industrial pursuits.

No attempt has hitherto been made to present in a concise treatise the subject of the condition and organization of Prussian continuation and industrial schools in general, and those of Berlin in particular. This deficiency, together with the fact that the limits of the different kinds of continuation schools are hard to define and not infrequently encroach upon one another, increases the difficulty of a presentation which is based upon official reports and the contributions of an Austrian specialist who himself inspected the institutions of Prussia.

Many boys in Germany leave the common school before they have attained the end it has in view. They can not express their own thoughts distinctly and intelligibly, correctly understand the expression of the thoughts of others, or give a quick and correct solution of simple arithmetical problems, either mentally or in writing. These acquirements are indispensable, however, to the mechanic as well as the farmer, to carry on his trade or follow his pursuit with advantage, and to protect himself against losses. Common schools are deterred by many circumstances from gaining their object in every detail; domestic

relations, the poverty or indifference of parents, great distance from school, sickness among children, overcrowding of the schoolroom, which prevents even excellent teachers from giving sufficient attention to each pupil, and finally, compulsory attendance, in the greater part of the State, being enforced insufficiently—all these causes contribute to the difficulties with which the elementary schools have to contend.

In Prussia, as in other German States, all these causes have for many years combined to urge the establishment of continuation or supplementary schools. Until twenty years ago little attention was paid to this subject in the old provinces of the Kingdom; less even than in those acquired in 1866. As early as 1844 the department of public instruction issued a report to all governments of provinces commenting upon the usefulness of such schools and advising the cooperation of clergy and teachers. At the end of two years a second report proved that an interest was manifested in only a few places where industrial activity necessitated a more advanced education than elementary schools afford. The absence of interest in the establishment of such schools was perhaps owing to the fact that the Government had not emphasized its encouragement by any pecuniary allowance.

Other conditions prevailed in the provinces acquired in 1866. In Nassau and Hanover industrial schools, so-called continuation schools, received appropriations from the State which Prussia transferred to the account of the department of commerce and continued to pay. After much consideration and discussion it was decided to increase this State appropriation for 1874, and turn it over to the minister of public instruction under the head of "Appropriations for industrial and continuation schools." In this way, the inequality resulting from the fact that the industrial schools of some parts of the State received assistance from the State, while the continuation schools of others received none, was removed in principle. The different official boards were advised to give the most assiduous care to existing institutions of this kind as well as to promote in a proper way the establishment of others; and, as far as possible, to aim at the establishment of supplementary schools in the industrial cities of each province. Communities are called upon to defray the cost of buildings, heat, light, and at least one-half of all other expenses not covered by actual receipts from tuition fees. An official order of 1878 compels factory owners and managers not only to permit their workmen under 18 years of age to attend continuation schools obligatory by local statute, but to allow every individual attending them the amount of time decided upon by competent authority. Consequently as journeymen, apprentices, or workmen could not be prevented from attending the optional continuation schools without the employer's incurring the risk of punishment, the department of public instruction was ever more ready to allow larger appropriations for the support of these institutions. In most cases, communities were willing to undertake the improvement of existing schools and the necessary enlargement of

classes consequent upon increased attendance only when the State voted appropriations for the expenses entailed. Concerning rural continuation schools, it must be said that the institutions are not distinguished as rural or industrial (city) schools from their situation in a country or city district, but from the arrangement of appropriate instruction for the wants of the majority of pupils. In rural schools the curriculum includes instruction in the mother tongue, arithmetic, mensuration, nature study through object lessons and where practicable by experiment, geography, native history, singing, gymnastics, and drawing. As all these studies can not be pursued at the same time, a selection is made and an interchange effected in view of the previous education of the pupil, the capacity of the teacher, special local conditions, and the number of hours per week. In every case care should be taken (so the order reads) that the school do not assume the character of a technical school, but consider as its end in view the completion and extension of common school education and the strengthening of ethical character. Instruction should be given at least during four hours a week; fewer hours are permitted only in communities where local conditions make a reduction in time imperative.

The rural continuation schools of Prussia are inconsiderable in number and are unequally distributed among the different districts. As communities, besides furnishing the buildings, as well as heat and light, until recently bore half, and at present bear at least a third of the other expenses, not covered by a rather large school tax, the number of these schools is proportionately small and varying. In many places every summer the question is decided anew whether instruction, almost everywhere limited to the winter season or to a few winter months, and not infrequently to fewer than four hours a week, shall be continued during the following winter. The decision of different communities is influenced by their temporary financial condition or the result of the harvest. In the year 1890 rural continuation schools numbered 727, with 11,144 pupils. Perhaps interest in these institutions would be greater than at present if they were given over to the minister of agriculture, public domains, and forests. This question is at present under discussion.

Industrial or city continuation schools consist of two grades of several classes each. The instruction given in the lowest grade advances the general education of pupils with special reference to their calling, and consequently practically embraces all subjects of the higher classes of advanced common schools excepting religion. The special aim of the advanced grades is the pupil's acquirement of industrial proficiency; in the selection of studies, local industrial relations are taken into consideration. In 1884 the minister of public instruction maintained, in an address to all provincial governments, that in all continuation schools which devote at most six hours a week to instruction, the course of study must be limited to language, arithmetic, and the beginning

of geometry and drawing; in other words, to the studies most important for trade and minor industries. In language, the common-school instruction is simply continued—distinct, intelligent reading, reviewing the reading matter, orthography, punctuation, and grammar. Stress is also laid on improvement in penmanship. No special instruction is given in grammar, or as a rule in penmanship; and, as it is impossible to treat history, geography, and nature studies as special branches, the German school reader offers suitable popular selections and extracts from standard works of natural sciences, whose text is to be analyzed in the reading class and appropriated by the pupil by means of verbal or short written reviews. The pupils are also instructed to compose letters, addresses, short compositions of business import, and the like. Single-entry bookkeeping is also taught in the upper grade, either in connection with language work or with arithmetic, which, like other branches, begins where the common school left off. In the lower classes attention is paid to the four fundamental principles of arithmetic, with denominate and undenominate numbers and common and decimal fractions; metric measures, weights, and German coins, and commercial calculations are practiced; the examples of proportion, interest, discount, profit and loss, etc., are practical applications of business necessities. As a knowledge of the first principles of geometry is indispensable to the practical demands of many industries, the pupil is so far advanced that he can calculate the perimeter and contents of plane figures bounded by straight lines, the contents of bodies with flat surfaces, and the sphere. Four hours out of eight per week, and where only six are given, two per week, are devoted to drawing; it is omitted only with four hours of instruction a week. In the larger continuation schools with more time, greater pecuniary resources, and better teachers at their disposal, the curriculum is more comprehensive. Instruction in mathematics is more advanced, mechanics and physics are also taught, and professional drawing is taught with a view to certain industries.

By industrial continuation schools, we understand all institutions which offer the opportunity to anyone engaged in industrial pursuits of any branch or condition whatever, whether apprentices, journeymen, or masters engaged in labor during the day, to acquire a partly general, partly professional, education, always based upon the necessity of a practical business life. This instruction is given during their leisure, i. e., on Sundays or during the evening hours of week days. As a rule, these schools are connected either with other industrial institutions, or with burgher and intermediate schools, the class rooms and appliances of which are at their disposal and whose teachers they employ. The State pays the greater part of the expenses. Since the passage of a law in 1886, purely public trade schools exist only in west Prussia and Posen, but only in the larger centers of industry. Instruction here is entirely gratuitous and obligatory for all workmen not over 18 years

of age. This law was a political measure aimed at repressing the efforts of demagogues to gain disciples among the young, and preserving and developing in children the elements of a German education begun in the common schools. In 1890 there existed altogether 159 of such trade schools, with 12,000 pupils in round numbers, while Prussia numbers 1,105 industrial continuation schools.

Besides the above mentioned there are a number of private schools which are simple industrial continuation schools established by societies, labor unions, or guilds. Barbers and hairdressers have the greatest numbers of technical schools; 58 out of the 67 exclude elementary instruction; painters have 29; tailors and blacksmiths, 24; shoemakers, 24; bakers, 21; tailors, 20; cabinetmakers and builders, each 10; masons, 6; locksmiths and butchers, each 5; paper hangers and tin-smiths, each 4; wheelwrights, 6; glaziers, saddlers, bookbinders, potters, and innkeepers, each 2; confectioners, chimney sweeps, dentists, gardeners, basket makers, and bricklayers, each 1. The necessity for technical schools does not exist in the same degree among the different trades and occupations. For barbers and hairdressers a common technical school is the shortest way and the one best calculated to save the master time and labor in perfecting the apprentice in certain branches. Customers who care to be shaved and have their hair dressed free of charge give beginners the opportunity of practicing. One person can teach the art of making wigs to many at the same time; so, too, a physician or clever surgeon can give better instruction in the services to be rendered in case of accident than most barbers. In a similar way the theory of horseshoeing is taught in these schools by experienced veterinarians. Nevertheless, as far as the education of apprentices by means of instruction is concerned, a guild can get along without establishing its own school if its members be compelled to allow their apprentices the benefits of the local industrial continuation school, and see that they attend regularly and punctually and are supplied with the necessary school requisites. In this case, the society should attend to individual complaints about absence and breach of discipline, maintain the rights of the school toward the apprentice, punish disobedience with expulsion from apprenticeship, strengthen the reputation of the school on every occasion, and endeavor to keep up a relationship with its teachers.

Certain institutions are to be regarded as a sort of medium between actual continuation and technical schools. Besides Sunday and night instruction for all kinds of industries, these transition schools, so to speak, during the day in winter instruct classes arranged for those industrial artists, painters, modelers, etc., who have comparatively little to do during the winter months, and can then attend schools. For this reason several of such institutions have received the name of industrial art schools, in which a preference is claimed for Sunday and night instruction. The conditions for admission are: A completed

common-school course, a required age, and a certain amount of practical preparatory knowledge. In general, the arrangement of studies on the one hand is planned so that instruction during the less busy season is a systematic continuation of work for such persons as are practically engaged in trades, as apprentices, journeymen, etc. On the other hand, the essential part of daily instruction is organized as a preparatory course for a regular technical school. In that case the Sunday and night school is called preparatory; the day school, technical, with classes arranged accordingly.

The trade school of Berlin is the most comprehensive and most perfectly equipped institution of its kind. It was founded in 1880 after the model of the general industrial school in Hamburg, whose director, Professor Jessen, was called to the principalship of the new institution in the capital city. The opening took place in the now demolished prince's residence in the old mint at the Werder market place. In 1886 a new building was completed. The State appropriates 20,000 marks, the city 90,000 marks a year for its maintenance. An advanced Sunday and night school, attended in the winter of 1889-90 by 2,074 apprentices and journeymen, forms the preparatory department of this institution. To this are added two day classes for cabinetmakers and painters and the technical school for mechanics. The Sunday and night school is divided according to separate courses of instruction. Drawing, as the most essential branch, is taught four hours a week, and lessons from two to four hours long are given to classes, so that pupils can be occupied eight hours a week. The lessons embrace demonstrative geometry, mechanics, mathematics, physics, chemistry, electro-technology, arithmetic, and bookkeeping.

On the whole no less than 121 courses of four and two hours a week and engaging 28 teachers were maintained during the winter of 1889-90. Elementary and professional drawing are taught, and modeling and painting practiced. How a large attendance and a sufficient individual representation of a multiplicity of industries complicate the management of such a school is seen from the course in professional drawing divided according to trades; in 1889-90 it comprised not fewer than 35 courses of four hours weekly for 13 different trades. For joiners and turners, 3 courses; for tinsmiths and locksmiths, 4; for machinists, 1; for instrument makers and opticians, 3; for watchmakers, 1; for jewelers and engravers, 1; for beltmakers, 1; for masons and carpenters, 4; for bricklayers, 1; for sculptors, 2; for painters, 8; for upholsterers, 4; for lithographers, 3; in each 30 to 40 pupils were instructed. The method of instruction in all drawing lessons rests preeminently on a strictly consistent application of life study, whereby very favorable results are obtained. A special, large building of model arrangement, with electric light for night instruction, abundant collections of accessories and appliances, and all that pertains to a complete school equipment, together with an excellent corps of teachers, are at the disposal of the institution.

The Austrian specialist who inspected this school proposes that the trade school be brought into a suitable organic connection with all the other industrial continuation schools of Berlin. If the central institution were intrusted with the direction or supervision of all the elementary continuation schools, it would tend to make all serve a uniform purpose and facilitate their development. The higher educational aim of the central trade school, and the more thorough preparation other institutions would then give, suggest this reform. Much more valuable individual accomplishments might be effected by such a union.

A technical school for mechanical engineers is found in connection with the trade school in Berlin. Its particular purpose is the education of foremen and managers of mechanical industries, and especially of expert mechanics and electricians. The studies comprise a half year's course, which can be extended to a year, and are taught during the forenoon only.

The trade school of Berlin, in which 42 teachers were employed in 1890, besides a director and assistant director, has repeatedly established winter courses for the higher education of drawing teachers in industrial continuation schools. It exerts a marked influence on the improvement of industrial instruction, not only in the capital, but also in many other cities, as Magdeburg and Hanover, where such schools have been enlarged, reorganized, or newly established, entirely in imitation of the model of the one in Berlin.

By foremen's schools we understand the lower industrial schools with day instruction, arranged for a whole group of industries. Their curriculum and methods are adapted to a general grade, which need not rank above a good common school, and they admit only practically educated pupils. Their aim is to offer young and old laborers the opportunities of gaining in the shortest possible time such technical knowledge and ability as can not be acquired in practice or in an industrial continuation school, but is indispensable with the present demands upon a self-dependent manager or foreman in industrial pursuits.

Certain branches of industrial pursuits taken collectively are distinctly separate from others, but may be classed into a greater or smaller number of industrial subdivisions. By being apparently related through their common intellectual foundation, they are naturally combined in one group. There are a number of such branches for whose perfect practice a certain amount of development in art and a knowledge of mathematics, mechanics, and chemistry is generally presupposed. To such groups belong the building trades, the mechanic and technological branches, the chemical industry, and the industrial arts.

Schools for such branches are sparingly represented in Prussia. The most frequent are builders' schools, which are entirely self-supporting institutions. The institution in Berlin, numbering 1,289 pupils (in 1891, 1,192), was formerly connected with the trade school. Its graduates

who pass the final examination, based upon the order issued in 1882 by royal commission, enjoy certain advantages in their occupations. Their diploma, in pursuance of the decision passed by the society of German builders in the year 1888, is accepted in place of the theoretical part of the test examination required by the laws of the society. All builders' unions are further advised in case of special vacancies to consider the graduates of builders' schools, to whom, moreover, the Government positions of road and station masters of railroads are open. Since 1891 the so-called Samaritan course on "first assistance in cases of accident" is delivered in these institutions. A six weeks' course of instruction given by a physician consists of two successive hours a week, of which one is devoted to a lecture, the other to practical exercises. It is intended to introduce the same instruction into technical schools for machinists and the larger weaving schools.

The various textile industries of Berlin are numerous represented. The number of active, self-dependent master weavers in the capital city was, in 1888, estimated at 3,000, with 2,000 journeymen and 500 apprentices; the number of handlooms in operation amounted to 5,000, while the automatic looms, attended mostly by girls under a foreman, numbered 2,000. To these must be added 1,200 ordinary looms with 300 masters and 500 journeymen and apprentices; and, finally, several hundred passementerie and 100 chenille looms. Between 4,000 and 5,000 workmen are supposed to be engaged in passementerie handwork. The United Loom Societies established a weavers' school, which was controlled by the State, in 1883, and supported by appropriations from even other manufacturers' societies, both local and in other provinces and states. As the rooms utilized for instruction, limited to Sunday, were by no means sufficient, the city in 1888 decided upon rebuilding, having the assurance that the state government in future would supply half of the current expenses not covered by actual receipts and equip the institution with the necessary new machines, looms, and other perquisites. The building was completed in 1890 at a cost of 180,000 marks, including the cost of the site. It offered the possibility of enlarging Sunday and night classes so that they could accommodate 450 weavers and passementerers. The new building also afforded opportunity for the establishment of a day weaving school of an upper and a lower grade, each with a one year's course. Sunday and night instruction is free to all apprentices and journeymen resident or at work in Berlin; the trustees have granted the same privileges to those belonging to nonresident societies. Others pay 24 marks annually; day pupils 100 marks the first year and 300 marks the second. The accounts of 1890-91 close with an expenditure of 49,060 marks, of which 14,000 were raised from tuition fees; the remainder was advanced by the state and city, each paying 17,500 marks. The institution is fully equipped with looms and apparatus, for the purchase of which the State, for 1890-91, appropriated an extra sum of 53,400 marks.

As has been stated, societies can establish and control industrial trade schools, provided they observe certain conditions; and the city authorities have the right to allow these institutions the use of city buildings and defray the expense of heat and light. Berlin has 8 of such guild schools, 1 each for printers, painters, tailors, wig makers and hairdressers, stone masons and bookbinders, and 2 for bakers. The other 12 technical schools, 1 each for masons and carpenters, cabinet-makers, saddlers, painters, chimney sweeps, barbers and hairdressers, wheelwrights, glaziers, shoemakers, blacksmiths, upholsterers, and basket braiders, have been established by communities, and are supported by guilds. The State contributes to the support of 8 of them. Several of these institutions sensibly confine themselves to the pursuit of purely technical knowledge and acquirements; pupils, therefore, are referred to continuation schools for their general industrial education. The majority, however, devote most of their time to language, arithmetic, drawing, and reading. The latter can hardly be called purely technical schools, and their pupils derive little advantage for business. This reflection applies preeminently, perhaps exclusively, to guild schools.

The Berlin art school, besides preparing pupils for the art academy and educating drawing teachers for higher educational institutions, has for its purpose the instruction of industrial artists in drawing, painting, and modeling, and therefore serves as a preparatory school for the technical class of the royal industrial art museum. The industrial art school connected with the last-mentioned educational institution omits from its night courses not only all preparatory branches, as elementary, free-hand, and geometrical drawing, drawing from casts, modeling, etc., but also all studies taught by lectures, as anatomy and projection. The school is accommodated in the side halls of the museum and comprises classes for the making of furniture, apparatus, etc., for modeling, chasing, engraving, copperplating, etching, artistic cabinetmaking, decorative and figure painting.

Male and female pupils are admitted, and number over 500.

In connection with the royal manufactory of porcelain in Berlin there exists a school for painters and modelers, the perceptible extension and improvement of which, since 1886, corresponds to the progress in pictorial decoration and the plastic formation of the products of the factory. A separate hall is set aside for painters, in which advanced students are regularly instructed during the whole forenoon of week days and for a few hours on Sunday. The classes are attended not only by journeymen, but, as far as the orders for work justify it, by many painters of advanced years, numbering on the whole over 40. If painters have devoted a long time exclusively to porcelain, they are obliged to occupy themselves for several weeks exclusively with ornamental and nature studies, for which the gardens and greenhouses of the factory supply the plants and blossoms. Journeymen are admitted

only when they show decided talent. Strange to say, private factories, until now, have expressed no desire to have their employed painters and modelers educated at the state institution; they are probably of the opinion that the royal porcelain factory in educating such persons is consulting its own needs only. Owing to the lack of room it is at present impossible to admit modelers; but painters' apprentices, even in smaller numbers, are not refused. Perhaps the difference in the manner of decorating existing between the royal factory and private factories is the reason why none of the latter has attempted to make use of the State school as a technical school for porcelain painters.

The chief administration of the Prussian industrial school system has in the course of the last decade repeatedly suffered changes and removal by having been transferred from the department of commerce and industry to that of public instruction and back again. At present the administration is divided. The higher industrial educational institutions, the Industrial Art Museum and its affiliated school in Berlin, the Art School of Berlin and the Industrial Art School of Breslau, are under the direction of the minister of instruction. All other industrial schools are under the minister of commerce and industry.

Finally, Berlin possesses two business colleges, the first of which was founded in 1885 by private merchants and a union of merchants' guilds. In comparison with other German cities, Berlin was backward in this respect. For fifteen years the resident city of the Hohenzollern had been the capital of the Empire, the center of politics, and the leader of German trade; but neither the State nor the city, neither the corporation of merchants nor a single one of the great societies of merchants, had thought of providing Berlin with one of such important—in fact, indispensable—institutions, while more than a hundred already existed in the large, small, and even most insignificant cities of the Kingdom. After much contention and many difficulties, there now exist two such institutions, for whose accommodation the city has allowed the use of two secondary school buildings. The tuition fee amounts to 36 marks per annum and opens all departments to the pupils attending. Instruction is given four nights a week, from 8 to 10 o'clock. Every pupil has the right to select his own course of study and belongs to both institutions at the same time, as the hours of instruction do not conflict. The faculty consists of 30 members, the number of pupils averages 1,300, and the curriculum includes commercial geography, exchange and business rules. The State appropriates 800 marks annually for both schools. At the meeting of the Prussian Diet on the 25th of February, 1894, Minister von Berlepch explained, during the discussion of the appropriation bill for the "industrial school system," that the Government deemed the promotion of business colleges indispensable. This assertion was provoked by the accounts of different business departments, which nearly all justly complain of the deficient education of young merchants.

Unfortunately, the Government has perceptibly curtailed the allowance for continuation schools, thereby verifying the assertion of Beningsen that there seems to be deplorably little money left for educational demands. The Government advocates the introduction of compulsory attendance, which is already enforced in all the larger German States. If we include the city continuation schools and all other similar institutions, even those not supported by the state, besides the different technical schools, over 17,000 persons, or about 40 per cent of the number under obligation to attend continuation schools, attended industrial classes during the winter of 1891. The Government recognizes the indisputable necessity of a normal school for teachers of continuation schools, so that they may receive more thorough instruction than the present short course of drawing offers. It considers the introduction of a regular supervision of industrial continuation schools, which is at present almost entirely wanting, as not less urgent or important.

The memorial of Councilor Lüders on technical education in Prussia concludes with the following words:

The administrative authorities of industrial education feel sure of receiving the appropriations necessary for the present needs and further development of the continuation schools.

Continuation schools are the only places where, outside of the workshop, hundreds of thousands acquire technical knowledge and proficiency, and next to the church they are the only places where thousands, and particularly all who do not enter the army after leaving the common school, are receiving ethical education, are counseled to practice civil virtue, and trained to order and discipline. If instruction, as it must be, is given in the proper spirit, pupils are not only materially benefited, but they are morally strengthened and awakened to the consciousness that man does not live by bread alone. Whoever is less affected by the ethical than the economical value of industrial continuation schools and industrial education will, nevertheless, recognize the necessity of the powerful and immediate claim expressed by an intelligent Frenchman, who says: "The best instructed industry is at present the strongest." Observation convinces one that the working people depend in a great measure upon industrial education, and that many skilled laborers, designers, masters, and manufacturers have gained their proficiency in technical schools; though the instruction may not in every case have been directly for the benefit of each man's occupation, it has proved to be so indirectly.

Nothing will be more convincing of the great care taken in Germany to aid industry than a presentation of the courses of study pursued in the Saxon technical schools at Chemnitz. They consist of (1) a high school for trade, (2) a builders' school, (3) a school for master workmen, (4) a school for millers, (5) for dyers, (6) for soap makers, and (7) a school of mechanical drawing.

The courses following here are reported by United States Consul

John A. Barnes at Chemnitz, Saxony, Germany, and first appeared in No. 517, volume 43, of Consular Reports, issued by the State Department. They are here reproduced to corroborate the statements made in the foregoing article.

For the school year 1891-92 there were enrolled 1,169 students in the seven departments of the Chemnitz school, as follows:

| School.                           | Full course. | Partial course. | Total. |
|-----------------------------------|--------------|-----------------|--------|
| High trades school.....           | 339          | 14              | 353    |
| Builders' school.....             | 140          | .....           | 140    |
| School for master workmen.....    | 304          | 71              | 375    |
| School for millers.....           | 17           | .....           | 17     |
| School for dyers.....             | 18           | .....           | 18     |
| School for soap makers.....       | 10           | .....           | 10     |
| School of mechanical drawing..... | 256          | .....           | 256    |
| Total.....                        | 1,084        | 85              | 1,169  |

Of the 1,084 students in this institution, 694 were natives of Saxony, 310 of other parts of Germany, and 80 foreigners, of whom 6 were Americans. The tuition of 63 students, amounting to 3,360 marks, was remitted during the year through various scholarships endowed by individuals and aid received from the Saxon Government. The expenditures were as follows: For the increasing of the collections in mineralogy, chemistry, etc., 4,073.55 marks (\$969.61); for the library, 6,870.60 marks (\$1,635); for school supplies, 36.59 marks (\$8.80).

The library contains 17,070 bound volumes, 1,743 atlases, 4,727 pamphlets, 453 maps, and 60,278 patent manuscripts. During the year 1891 there were loaned 7,450 volumes, as follows: To 47 teachers, 1,923; to 1,006 students, 5,013; to others, 2,960; also, 995 patent records were consulted.

#### 1. ROYAL HIGHER TRADES SCHOOL.

This school offers to those intending to devote themselves to one of the departments given below the means of obtaining, through carefully planned instruction and suitable practical application, the necessary scientific preparation appropriate for each.

A.—Mechanical technology; for those intending to become manufacturers, superintendents (Directoren), or mechanical experts (Techniker) in the different departments of mechanical technology (machine building, spinning and weaving, etc.).

B.—Chemical technology; for intending manufacturers, superintendents, experts, etc., in the different chemical trades and manufacturing departments.

C.—Building; for architects. The instruction in this department is not parallel with that given in the building school, from which it differs in having a broader scope and the plan of instruction differently arranged.

D.—Electrical technology; for manufacturers, engineers, and experts in electric apparatus.

Each of these departments has three courses, of which the first requires three terms (Halbjahre) and the second two. The third course in the mechanical, chemical, and electrical departments requires two terms and in the building department only one. In studies which are the same in all four departments instruction is given to all the students together when practicable. Instruction begins in the first course of Departments A, B, and E in the first week after Easter; in the first of the building department, as well as the second and third courses in all three divisions, the first week in October.

The students in the first course in the building department have, after their first term, a summer term of practical work in the business. Entrance into this school, except in special cases, must be at the beginning of the course. Candidates must be at least 15 years old, must be vaccinated, must possess the necessary preliminary knowledge, and, in cases of minors, must have the consent of the father or guardian. In the case of those entering the first course of the building department, at least half a year must have been spent in practical building work. For scholars in Department A from one to two years' experience in a machine shop of small or medium size is recommended, and for scholars in Division E, such a course in a machine shop or in electrical works.

At the beginning of the first course students are admitted without examination who have certificates showing that they have completed the course in a Gymnasium or Real-Gymnasium for entrance into the Obersekunda or in a Real-Schule and have a mark of over 3 (*genügend*) in German and mathematics. Those are also admitted without examinations who have successfully completed a year or more in the Obersekunda of a Gymnasium or a Real-Gymnasium. All those candidates for admission who have not already passed their preliminary scientific examinations for voluntary military service, or refer to it only before the examining committee, are subject to examination. To these examinations candidates can also be admitted who have completed their course for the Obersekunda or in the Real-Schule, but whose mark was not above 3 (*genügend*) in German and mathematics, or who have not entered a higher class in the Real-Gymnasium or Gymnasium than Untersekunda.

For admission, these must also bring certificates showing the mark attained in each case. On account of lack of space, those who have attained a higher practical experience may be advanced in proportion upon their entrance. The entrance examinations include German, mathematics, geography, and French. The requirements are: In German, accuracy in spelling and in elementary grammar and ability to prepare compositions; in mathematics, knowledge of algebra and simple equations and plane geometry; in geography, knowledge of the most essential parts of physical and political geography; in French, principal rules of construction and syntax.

For entrance into a higher course after it is begun, the additional knowledge of what has already been gone over by the class is required. Those who enter the second or third term of the first course or a higher one in the building division must have had two terms of practical experience. For special examinations for entrance in higher course or for other cause, an extra charge of 10 marks (\$2.38) is made. The admission is final (*endgiltig*) when the applicant has fully complied with these conditions. It is conditional (*bedingt*) if the examination shows an incomplete preparation, but a prospect of its being made up. The conditional entrance becomes final if no further cause of delay appears on the mark attained at the end of the first term.

Application for admission is to be made to the board of directors, either orally or in writing, for the Easter term, not later than Palm Sunday; for the fall term, not later than September 15. The condition as given above must be complied with by bringing the officially sealed or stamped certificate of birth, the certificate of vaccination, and all the school testimonials, together with the written consent of the father or guardian. Those who have had practical experience must present testimonials as to all their work and their progress, and must state which department they wish to enter and whether they have already had one term (Department C, second term).

All these certificates and testimonials must be presented at least a week before the examinations. All students are alike subject to the rules of the school, and in relation to attendance, behavior, and preparation of required work are subject to the oversight of the board of directors and the instructors.

At Michaelmas and Easter a report of the standing and deportment of each student is sent to parents or guardians. Only those students who have attained in all branches at least the mark 3 are allowed to advance to the next higher course; nor are students allowed to go on to the work of any term unless the same mark (3—

genügend) has been attained for the work of the previous term. Any student who has taken the work of the same course or term twice without attaining the necessary average must leave the school. Any student leaving the school before the completion of the full course may have a certificate showing progress made and the length of time spent in the school.

Students who have completed the third course, having a mark of at least "passed" (genügend) in all the studies of the last term and having an average mark of "fairly good" (ziemlich gut) for the last three terms, receive a diploma (Absolutorial-Zeugnis); but, if they have fulfilled only the first and second conditions, they receive only a testimonial (Abgangszeugnis) giving a summary of the several term marks. Those who have received a diploma and who wish to continue their studies in a higher school, instead of devoting themselves to immediate practice, are admitted without examination as undergraduates (Studirende), as distinguished from listeners (Hörern) or special students (Hospitanten), to the Royal Technical High School at Dresden, and the Royal Bergakademie, and will also be admitted to all examinations in the Dresden High School, except that for the higher public service in the building department.

Persons who are of age may be allowed by the director, with the consent of the teachers concerned, to attend particular lectures and practical work. They are considered Hospitanten, are not subject to the rules of the school, and may obtain a certificate showing that they have received such instructions, and for how long. This permission may be revoked at any time for sufficient cause.

The tuition fee is 60 marks (\$14.28) per term for Germans and 120 marks (\$28.56) for others, payable in advance at Easter and Michaelmas. German Hospitanten and students in single studies pay 5 marks (\$1.19) for each hour of instruction per week up to 60 marks (\$14.28) per twelve or more hours, and others pay twice as much. Tuition once paid will under no circumstances be returned. Indigent and worthy students who are natives of Saxony and have attended the school at least one term may have the tuition remitted. The institute possesses a number of fixed scholarships for assisting students. Applicants for remission of tuition or scholarships must present in writing to the board of directors (under the rule of the royal minister of the interior of 1850) suitable testimonials as to their need. The expenses for books, writing and drawing materials, etc., average 40 to 50 marks (\$9.52 to \$11.90) a year.

The directors refer students to families where they may obtain board and lodging, for which the expense varies from 600 to 1,000 marks (\$142.28 to \$238) a year.

The course of study is as follows:

#### FIRST COURSE.

##### FIRST TERM.

*For all the departments together, separated into divisions according to qualification (Departments A, B, and E in summer and C in winter).*

(1) German language (three hours per week). Preparation of written compositions and oral theses; reading and explaining middle high German and the later classic fiction (continued in second and third terms, Nos. 11 and 26); logic.

(2) Free-hand drawing (four hours per week). Drawing from charts and models; practice in india ink; study of colors.

(3) Geometrie and projection drawing (four hours per week). Constructions in planes preliminary to geometrie and technical drawing; elements of projection; representation of bodies bounded by plane surfaces and spherical bodies in different positions through perpendicular projection; elementary sketching practice; plane cross sections of bodies; simple relief drawing; practice in india ink. (Continued in second term, No. 18.)

(4) Mathematics (eight hours per week). Review in detail of the divisions of elementary mathematics required for admission and continuation of same; plane

geometry; arithmetic and algebra, including theory of potentials, with positive integral exponents; equations of the first degree with one unknown quantity, with applications.

(5) Chemistry (four hours per week). Inorganic chemistry, introduction; theory of atoms; chemical combination; reference to nonmetals and their more important compounds.

*For Departments A, B, and E, divided according to qualification.*

(6) Physics (four hours per week). Introduction; mechanics of solids.

(7) Building and architectural drawing (four hours per week). Study of materials; first part of stone construction; walls, their construction and penetration; the vaulted arch; architectural drawing from assigned subjects.

*For Department C.*

(8) Physics (four hours per week). Introduction; general mechanics; mechanics of solids; hydrostatics.

(9) Architectural drawing (four hours per week). Drawing parts of buildings, moldings, etc., with illustrations; copying of plans.

(10) Building materials (two hours per week).

#### SECOND (WINTER) TERM.

*For all departments, divided according to qualification.*

(11) German language (three hours per week). Continuation of No. 1; rhetoric.

(12) Mathematics (eight hours per week). Solution of problems in plane geometry by geometric and algebraic analysis; goniometry and plane trigonometry potentials; roots; logarithms; equations of the second degree with one unknown quantity, with applications.

(13) Chemistry (four hours per week). Inorganic chemistry; continuation of No. 5; reference to more important metals and their compounds.

*For Departments A, B, and E, divided as above.*

(14) Geometrical drawing (six hours). Stereometric drawing; supplementary instruction on perpendicular projection of points, lines, angular figures, and circles on a plane of projection; drawing figures on two planes of projection; shifting and removing; axis of projection; straight lines through given points; planes through given point and straight line; intersection of planes and straight line; introduction of new planes of projection; differences between points and straight lines; angles between planes and straight lines; shadows of points, lines, and plane figures. (Continued in third term, No. 31.)

(15) Physics (four hours per week). Hydrostatics; hydrodynamics; aërostatics; aërodynamics; wave theory; acoustics.

(16) Machine drawing and sketching (two hours per week). Drawing of machine parts and simple power and working machines from models and from sketches taken by the students themselves.

(17) Building and architectural drawing (four hours per week). Continuation of No. 7; wood construction; roofs, both supported by pillars and free, with special regard to factory building; massive ceilings; chimneys in buildings; steam flues; stairs; architectural drawing as in No. 7, as well as sketching practice on high buildings.

(18) Projection drawing (two hours per week). Continuation of No. 3.

(19) Technical calculations (one hour per week). Exercises on superficial pressure, pistons, valves, cross sections of belts and ropes; exercises on velocity, adjustment of wheels, pumps, tubes, exercise on mechanical work, working of power machines, transmission by ropes and belts; winding appliances. (Continued in third term, No. 33.)

*For Department C.*

(20) Geometrical drawing (four hours per week). Auxilliary instructions in stereometric drawing; orthogonal projection; drawing of plane figures on one plane of projection; affinity; graphic determination of straight lines and planes, with exercises on mutual relations of these figures; affinity of projections of plane systems; transition from one projection system to another; changing of objects already drawn.

(21) Physics (four hours per week). Hydrodynamics; aërostatics; aërodynamics; wave theory; acoustics; transmission of light; photometry; reflection of light.

(22) Free-hand drawing (four hours per week). Continuation of No. 2.

(23) Building and architectural drawing (four hours per week). Plans of agricultural buildings and small dwelling houses.

(24) Building construction (four hours per week). Laying foundations—the site, its improvement, removing water; foundations of pillars; sunk shafts; caissons; gratings; stone construction; dressing and working of stone; construction of walls and pillars of quarry stone, hewn stone, and brick; drains; apertures in walls and the necessary frames, etc.; stone ceilings and vaults; necessary tools and scaffolding.

*For Department E, together with No. 50.*

(25) Physics (four hours per week in last weeks of term). Frictional and induced electricity.

## THIRD (SUMMER) TERM.

*For all departments, divided according to qualification.*

(26) German language (three hours). Continuation of Nos. 1 and 11; poetry.

(27) Mathematics (eight hours). Trigonometrical exercises; solid geometry (stereometry); equations of the first and second degree with more than one unknown quantity, with applications; continued fractions and indeterminate equations; exponential equations; progressions; calculating interest and rents.

*For Departments A, B, and E.*

(28) Chemistry (for Departments A and E two hours per week, for B four hours). Organic chemistry; consideration of most important organic compounds.

(29) Physics (four hours). Optics; transmission of light; photometry; reflection; refraction; spectrum analysis and the most important points in interference of light; polarization and double refraction.

(30) Building and agricultural drawing (four hours). Continuation of No. 17; iron construction for high buildings; proper fitting up of buildings, especially workshops; their ventilation; architectural drawing as in No. 17; small designs; factory fittings.

*For Departments A and E.*

(31) Geometrical drawings (four hours). Projection of bodies with plane surfaces; plane sections of bodies of three dimensions; shadows proper and shading of bodies of three dimensions; shadow of one such body on another; drawing curved lines, especially circles and spirals; shading of a circular body; elements of perspective.

(32) Machine drawing (four hours). Continuation of No. 16; theory of construction of toothed wheels.

(33) Technical calculations (one hour). Continuation of No. 19; calculation of axes and wheels.

*For Department A.*

(34) Surveying (half a day per week). Practical exercises in field surveying; description, trial, and use of simple surveying apparatus; marking off and measuring straight lines; erection and dropping of perpendicular; surveying single plats and boundaries with the chain and goniometer; platting from field notes; computa-

tion of area; elementary work with surveyor's table; surveying of plats, either with free or obstructed "sights;" description, trial, and use of the leveling instrument; surveying and drawing of profiles and horizontal curves.

*For Department B.*

(35) Chemistry (two hours). Beginning of instruction in the sections of organic chemistry necessary for those in the chemical department, in addition to the course of all departments together.

(36) Practical chemical work in the laboratory (eight hours). Exercises in qualitative analysis and performing of easy chemical operations.

*For Department C.*

(37) Physics (four hours). Refraction; spectrum analysis; most important points in interference and polarization; theory of heat; thermometers; expansion by heat.

(38) Free-hand drawing (two hours). Drawing and shading from the larger building ornamentation.

(39) Building and architectural drawing (six hours). Continuation of No. 23; fitting up of buildings.

(40) Building construction (six hours). Wood construction—wood joining, construction of wooden walls, wood ceilings, girders, pillars, roof construction; iron construction in broad sense.

(a) Construction in which iron is used as an auxiliary to wood or stone; anchors, props, shoes, etc.

(b) Iron construction proper; stays; pillars; beam and roof construction.

(41) Geometrical drawing (four hours). Derivation of distances and magnitude of angles from projection; computation of roof surfaces; elements of shading and perspective; bodies with plain surfaces and their combination; shadows and shading.

(42) Chemical technology (two hours). Chalk; mortar; air-slaked mortar; water-slaked mortar; plaster.

*For Department E, together with No. 74.*

(43) Physics (four hours). Voltaic electricity; electrolysis; magnetism and electro-magnetism.

ELECTIVE STUDIES OF FIRST COURSE.

(44) Geography (three hours in first and second terms). European countries and peoples; civilized peoples outside of Europe.

(45) History (three hours in third term). Brief survey of antiquity and the Middle Ages

(46) Commercial arithmetic (for Departments A and B, two hours per week in first term; for Department C, two hours in third term). Rebates and provisions; interest and discount; explanation of Leipzig gold and exchange; reports and computation according to same; simple problems in exchange, and exchange discount; computation of interest in account current; bonds and stocks; trade accounts (invoice, etc.).

(47) French (three hours per week throughout course). Composition; word order; concordance; cases and prepositions; use of tenses, indicative and conjunctive, infinitive and participle. The following text-books are used: "Kurzgefasste systematische Grammatik der französischen Sprache" and "Methodisches Lese- und Übungsbuch," by Plötz. Reading of standard selections from "La jeune France littéraire," by J. Forrest. (Continued in second and third courses.)

(48) English (three hours per week during all three terms). Grammar on basis of the manual "Vollständiger Lehrgang der Englischen Sprache," by Plate. As reading exercises there are used during the first two terms the reader which accompanies the manual, and in the third term some easy classic.

## SECOND COURSE.

## FIRST (WINTER) TERM.

*For all departments together, separated into divisions according to qualification.*

(49) German language and history of literature (two hours). Exercises in speaking and history of older literature. (Continued in No. 73.)

*For Departments A, B, and E.*

(50) Physics (four hours). Theory of heat; thermometrics; expansion; change of state of aggregation; radiation of heat; calorimetrics; mechanical equivalent of heat; frictional and induced electricity. (Continued in second term, No. 74.)

*For Departments A and E.*

(51) Mathematics (eight hours). Algebraic analysis; first part of higher algebra and of differential and integral calculus; analytic geometry (plane). (Continued in second term, No. 76.)

(52) Geometrical drawing (four hours). Axonometric and oblique projection; curved surfaces in general; cylinders, cones, etc.; cutting of curved surfaces by planes and straight lines; unrolling surface of cylinders and cones; intersection of curved surfaces; shading of hollow bodies; shade of one round body upon another; regular spiral surfaces, especially screw spirals and their applications. (Continued in second term, No. 80.)

(53) Mechanics (four hours). Theory of equilibrium and motion of solid, liquid, and gaseous bodies, with as much attention to detail as the application later to machines and machine building demands, and, so far as practicable, with application of higher mathematics; first part, combination and decomposition of forces; force in a plane; conditions of equilibrium; pairs of forces; forces in space; center of parallel forces; center of gravity; stability; Guldin's rule; friction; stiffness of cords; theory of elasticity and rigidity. (Continued in second term, No. 77.)

(54) Machine drawing (six hours). Designing machine parts. (Continued in No. 78.)

*For Departments A and B.*

(55) Chemical technology (two hours).. Water—its source and its circulation in nature, its retention and its changes, application in domestic economy and the trades, its fitness for use; filters and conduits; heating and fuel; lighting and illuminating materials. (Continued in No. 75.)

*For Department A.*

(56) Surveying (two hours). Lectures concluding the theoretical part of the instruction begun in the first course, and, so far as practicable, practice in platting; illustration of terrain situation, etc.

*For Department B.*

(57) Technological chemistry (two hours). The whole department of inorganic chemistry reviewed, in order to fix and widen the chemical knowledge and judgment of the student, and its application in the most important trades given and an illustration of the most important chemical manufactures (sulphuric acid, soda, chloride of lime, etc.); also the principal inorganic natural products, so far as they are not considered in chemical technology and metallurgy, are taken up in their proper places. (Continued in No. 81.)

(58) Analytic chemistry (two hours). Qualitative analysis reviewed and completed; quantitative analysis touched upon.

(59) Practical chemical work in the laboratory (sixteen hours). Practice in qualitative and quantitative analysis; illustration and examination of different preparations. (Continued in No. 82.)

(60) Mineralogy (four hours). Mineralogical characteristics, with special attention to crystallography; description of the more important minerals; sketch of the precious stones.

(61) Mechanics (two hours). Theory of equilibrium and the movement of solid, liquid, and gaseous bodies, with special attention to the chapters most important to chemical technique, under exclusive application of elementary mathematics. (Continued in No. 83.)

(62) Machine drawing (two hours). Drawing of machine parts and simple machines from models and from sketches taken by the students themselves. (Continued in No. 84.)

*For Department C.*

(63) Physics (two hours). Theory of heat continued; state of aggregation finished; elation of the vapors; radiation of heat; calorimetrics; mechanical equivalent of heat; electricity; frictional and induced electricity. (Continued in No. 91.)

(64) Mathematics (six hours). Elements of differential and integral calculus; analytical geometry (straight lines, circles, and conic sections); tangents and normal plane curves; rectification; quadrature; cubature; evolution and involution. (Continued in No. 85.)

(65) Geometrical drawing (four hours). Perspective drawings of different plane objects with definite boundaries (stairs, walls, etc.) and the proper shading; curved lines and surfaces in general; special cone, cylinder, and rotating surfaces; intersection of curved surfaces with planes and with each other; conic sections; shading of revolving surfaces. The method of projection used is ordinarily the rectangular, but in many cases (cross, arches, etc.) the perspective.

(66) Mechanics of building construction and graphical statics (two hours). Conditions of equilibrium of forces on solid bodies; polygon of forces; polygon of cords; reciprocal action of forces; truss and street frames; theory of rigidity; simple strength of materials (bending with stroke or pressure, breaking), calculation of pillars and doubly supported columns. (Continued in No. 86.)

(67) Building construction (four hours). Continuation of No. 40; stonecutting; interior construction; stone, wood, and iron stairs; floors (paved, plastered, or of wood); protecting and decorating inside and outside walls; interior wood construction (wainscoting and doors, wooden and iron window frames, including the trimmings); ceilings in wood and stucco; coatings of all kinds; roof coverings (wood, straw, tile, slate, metal, and paper roofs).

(68) Designing (eight hours). Making of plans, according to a given outline, of dwelling houses of all kinds fitted up in various ways, schools, churches, railway stations, factories, etc.; preparation of specifications and working drawings in different ways; preparing plans for renovating and remodeling old buildings. (Continued in Nos. 88 and 119.)

(69) Free-hand drawing (four hours). Drawing and sketching extended to the larger ornamentation of different styles of building. Advanced students begin figure drawing.

(70) Theory of pillar arrangement and styles (two hours). Arrangement of pillars explained by lectures and illustrated in detail by selected examples; cornice forms of the Renaissance.

*For Department E.*

(71) General electro-technique (three hours). Brief review of theory of electricity and magnetism; setting up, operation, application, and inspection of dynamos; electric lighting and transmission of power; accumulators. (Also elective for third course.)

(72) Telegraphy and telephony (two hours). Detailed treatment of house telegraph and telephone plants; the most important of the different telegraphs and telephones. (Continued in No. 92.)

SECOND (SUMMER) TERM.

*For all departments.*

(73) German language and history of literature (two hours). Continuation of No. 49.

*For Departments A and B.*

(74) Physics (two hours). Operation of discharge currents; electrolysis; magnetism and electro-magnetism.

(75) Chemical technology (two hours). Continuation of No. 53.

(76) Mathematics (eight hours). Continuation of No. 51.

(77) Mechanics (five hours). Continuation of No. 53; movement of mathematical points; velocity; acceleration; motion of projectiles; movement of plane systems; mechanical work; mechanical power; movement of material points; living forces; principle of work; parallel motion of one material system; revolving motion; inertia; centrifugal force; inclined motion of one material system; principle of d'Alembert; percussion of solid bodies; elements of graphical statics with application to the calculation of machine parts and bridge girders.

(78) Machine drawing (six hours). Continuation of No. 54.

(79) Machine building (four hours). Construction of machine parts; construction of screws; screw, rivet, and wedge jointing; framework, etc; tooth wheels and pulleys.

*For Department A.*

(80) Geometrical drawing (two hours). Continuation of No. 52.

*For Department B.*

(81) Technical chemistry (two hours). Continuation of No. 57.

(82) Practical chemical work in the laboratory (sixteen hours). Continuation of No. 59.

(83) Mechanics (four hours). Continuation of No. 61.

(84) Machine drawing (four hours). Continuation of No. 62.

*For Department C.*

(85) Mathematics (six hours). Continuation of No. 64.

(86) Mechanics of building construction and graphical statics (four hours). Continuation of No. 66; elastic line; calculation and graphical determination of spliced beams; ceilings; iron and wooden roof frames; stability of walls; graphical determination of arches, pillars, buttresses; chimneys; retaining walls.

(87) History of architecture (two hours). Consideration of the development of building methods among the civilized nations influential in our time and the most important monuments of the builder's art.

(88) Designing (ten hours). Elaboration of a dwelling house according to a given plan of construction; small collaborative designs; excursions.

(89) Free-hand drawing (four hours). At the beginning of the term and on rainy days, landscape drawing from studies; later, in good weather, from nature; for advanced students, in colors.

(90) Surveying (half a day per week). Practice like No. 34.

(91) Physics (two hours). Voltaic electricity; electrolysis; magnetism; electro-magnetism.

*For Department E.*

(92) Telegraphy and telephony (two hours). Continuation of No. 72.

(93) Special electro-technique (two hours). Theoretical treatment of electric and magnetic phenomena; instruments and methods of measuring electricity and magnetism. (Continued in first term of third course, No. 122.)

(94) Practical work in the laboratory (eight hours). Measuring strength of currents, resistance and tension of conductors; gauging of measuring instruments; photometry; electro-static and magnetic measurements. (Continued in third course, No. 123.)

## ELECTIVE STUDIES IN SECOND COURSE.

(95) History (three hours per week in both terms). History of modern times.

(96) Bookkeeping and correspondence (two hours in first term). Theoretical part of bookkeeping; explanation of different methods of bookkeeping; object, arrangement, and use of ledger and other books; practical part, business routine extending over a period of three months both by single and double entry; correspondence; business papers.

(97) French (three hours in both terms). Instruction continued in grammar; syntax of the articles, adverbs, and numerals; pronouns; conjunctions.

(98) English (three hours in both terms). Instruction continued in grammar, second part of Plate; dictation; reading of some easy classic work.

## THIRD COURSE.

## FIRST (WINTER) TERM.

*For all departments together, separated into divisions according to qualifications.*

(99) German language and history of literature (two hours). Practice in speaking; history of the later literature from Opitz to Lessing, and general characteristics of further development down to the present.

*For Departments A, B, and E together, separated into divisions according to qualifications.*

(100) Political economy (two hours). Elements of political economy by Roscher; statement of essential principles of trade, commerce, and labor relations; finance. (Continued in second term, No. 125.)

(101) Metallurgy (two hours). Discussion of source and characteristics of the most important metals, especially iron.

(102) Mechanical technology (four hours). Characteristics of the technically important metals and alloys; molds and castings; tools and machines for working metal; characteristics of wood; tools and machines for working it.

*For Departments A and E.*

(103) Mathematics (four hours). Second part of higher algebra and differential and integral calculus; elements of the methods of least squares; spherical trigonometry; analytical geometry of space. (Continued in second term, No. 127.)

(104) Mechanics (two hours). Continuation of instruction in mechanics in second course; hydrostatics; pressure of fluids in rest; stability of floating bodies; hydromechanics; hydraulic press; discharge of water from vessels; water pipes; motion of water in rivers and canals; reservoirs; equilibrium and motion of gaseous bodies.

(105) Machine building (four hours). Construction of machine parts (tenons and shafts, couplings, cords and chains, bars, levers, windlasses and windlass bars, core wheels, guides, brakes, springs, pistons, valves, cocks, and sluices); machines for moving weights; pumps. (Continued in second term, No. 128.)

(106) Machine theory (four hours). Living motors; steam engines; counterpoises and fly wheels; regulators; elements of mechanical theory of heat; steam heat; steam boilers; vertical water wheels and turbines; measurement of moving forces; blowing machines. (Continued in second term, No. 129.)

*For Department A.*

(107) Machine construction (twelve hours). Plans of machine parts and machines. (Continued in second term, No. 130.)

*For Department B.*

(108) Physics (two hours). Illustration and practical experience of the methods used in physical determination; determination of specific gravity of bodies in all three states of aggregation, noting correction for temperature; polarization of sugar; determination of specific heat and other physical operations performed by chemical means.

(109) Technical chemistry (two hours). Consideration of manufacture of inorganic commercial products continued and organic begun. (Continued in second term, No. 131.)

(110) Practical chemical work in the laboratory (sixteen hours). As in second course, but in work selected with regard to the future vocation of the student. (Continued in second term, No. 132.)

(111) Machine drawing (two hours). Continuation of instruction in second course. (Continued in summer term, No. 133.)

(112) Instruction in machinery (four hours). Most important machine elements for strength and for transmission, alteration, and regulation of motion; motors in common use; the most important working machines, with special regard to the requirements of chemical technique. (Continued in summer term, No. 134.)

*For Department C.*

(113) History of molding and painting (one hour).

(114) Building laws (one hour). Consultation and explanation of police regulations on building (Saxon building ordinance in law of February 27, 1869); local building ordinances, regulations concerning fire insurance, etc.

(115) Heating and ventilation (two hours). Essentials of heating, fuels in general, fire space, heat space, chimneys, local heating, determination of heating surface, central heating; air, its contamination, dampness, velocity; influence of outer air on ventilating appliances; natural and artificial ventilation; dimensions of ventilating flues.

(116) Free-hand drawing (four hours). Designs of ornaments for special objects or rooms or of entire ornamental objects, making use of pattern sheets and models.

(117) Interior decoration (four hours). Designs of wall, floor, and ceiling decorations in wood, stucco, etc., based on the Renaissance and later styles of building; in conclusion of instruction in designing, No. 88.

(118) Cost estimates (two hours). Finding average price for mason and carpenter work, etc.; preparing estimates of cost for a given plan; preparing approximate estimates; estimating value of buildings; formalities necessary in building contracts, etc.

(119) Designing (fourteen hours). Continuation of No. 88, with application of perspective.

(120) Machine building (two hours). Lifting apparatus; raising by hand and by steam power; hand rams and steam rams; pumps; steam boilers; stationary engines; locomotives; water wheels and turbines.

(121) Street construction and waterworks (two hours). Study of construction of the city streets, lengthwise and cross profile; elements of earth construction, drainage, tools and machines, different methods of street construction, study of reservoir construction, strengthening of banks; foundations; waterworks dam building; water supply of city, etc. The instruction is limited to consideration of general fundamental principles, without going into special details.

*For Department E.*

(122) Special electro-technique (four hours). Continuation of No. 93; continuous-current machines and accumulators; alternating-current machines and transformers; electric lighting and transmission of power; the most important points of electro-chemistry.

(123) Practical work in the laboratory (eight hours). Continuation of No. 94; measurements of electric apparatus; testing lightning rods; measurement of continuous-current machines and plants; working measurements; provisional installation of plants, using the materials at hand and practice in their use.

## SECOND (SUMMER) TERM.

*For Departments A, B, and E, divided as above.*

(124) German language and history of literature (two hours). Practice in speaking; special study of the history of literature from Lessing on.

(125) Political economy (four hours). Continuation of No. 100.

*For Departments A and B together.*

(126) Mechanical technology (four hours). Peculiarities of fibrous materials, especially cotton, flax, wool, and silk; their spinning and weaving; paper manufacturing.

*For Departments A and E.*

(127) Mathematics (four hours). Continuation of No. 103.

(128) Machine building (four hours). Continuation of No. 105.

(129) Machine theory (four hours). Continuation of No. 106.

*For Department A.*

(130) Machine construction (twelve hours). Continuation of No. 107.

*For Department B.*

(131) Technical chemistry (four hours). Continuation of No. 109.

(132) Practical chemical work in the laboratory (sixteen hours). Continuation of No. 110.

(133) Machine drawing (four hours). Continuation of No. 111.

(134) Instruction in machinery (two hours). Continuation of No. 112.

*For Department E.*

(135) Designing electric apparatus (four hours). Designs and calculations for machines and simple apparatus; fitting and working of electric centers.

(136) Practical work in the laboratory (sixteen hours). Continuation of No. 123.

## ELECTIVE STUDIES IN THIRD COURSE.

(137) French (two hours). Syntactical exercises from Plötz; dictation on history of French literature; conversation.

(138) English (two hours). Continuation and finishing of the grammar and practice in translating German compositions into English; reading some classic author; dictation; conversation.

(139) First aid for the injured (double hours in summer term). Skeleton; muscles, nerves, and principal organs of the human body; circulation of the blood; breathing; contusions, wounds, bleeding, broken bones, dislocations, sprains; saving from burning and from drowning; treatment in cases of drowning, freezing, and suffocation, lightning stroke, poisoning, partial burning; transportation of accident cases; practice in using folded and unfolded triangular cloths, roll bandages, and splints in stopping bleeding; artificial breathing as a means of restoring those apparently dead; removing the wounded.

To students in the third course and in the second term of the second course of the building department is given, also, opportunity to avail themselves of the instruction in the following departments of the Werkmeisterschule:

Mill building (two hours in winter term). Characteristic of different systems of cutting mills; their return for power expended; fitting of oil mills with special

regard to hydraulic presses and pumps; milling processes; the most important of the preparatory and auxiliary machines used in flour making.

Waterworks construction (two hours in summer term). Obtaining and storing water; cisterns; improvement of springs; sinking ordinary and artesian wells; purifying river water; water pipes; reservoirs; characteristics of different systems of pumps; calculation of their capacity and their necessary use in mechanical work.

Machine-tool building (two hours in summer and winter term). Description and calculation of machine tools for working metal and wood, especially lathes, boring and cutting machines, planing and grooving machines, screw-cutting machines; illustration of working of these tools; carving and edge tools; use of power; ascertaining motion of principal and supplementary, direct, and transmitted motion; reference to constructive forms and peculiarities of machine tools; study of details.

Brewery mechanics (two hours in summer term). General view of preparation of beer from grain; materials used in making beer, their qualities so far as important to the brewer, and the machines and buildings used in their preparation and preservation; preparation of malt; cleaning and sorting the grain; soaking; setting on the malt floor; mechanical setting apparatus; malt kilns and their management in preparing different kinds of malt; marks and qualities of a good malt; its cleaning and preservation; brewing with wort and the machinery employed; malt presses, mash machines, clarifying apparatus; brewing pans and the necessary mason work; pump and piping; hop strainers; hop presses; boiling-house arrangement; cooling apparatus.

Distillery machines (two hours in winter term). Alcohol and the characteristics most important to the understanding of the distilling processes; general view of the manufacture of spirits and the materials used; potatoes and their characteristics; producing of the mash machines for washing; the older machines for boiling, cleaning, and mashing potatoes; description, working, and use of the newer mashing apparatus; preparation of distilling malt and its difference from brewing malt; thinning and cooling of mash; cooling apparatus; description of fermentation and preparation of yeast and the space and apparatus used; building, working, and use of the distillery apparatus.

Paper manufacture (two hours in summer term). Historical; range of modern papers; kinds; raw materials and auxiliary materials.

Half-material manufacture. Cutters, dusters, boilers, engines, defibrers, refiners, sorters, soda process for production of straw and esparto materials; soda sulphate and sulphite process for wood pulp, with the proper machinery; bleaching with chlorine gas and chloride of lime; the proper machines and fittings; whole-material manufacture; engines, refiners, crushing mills, new German apparatus (circular stamp work); mixing, sizing, and dyeing; engine mixing; application of colors; hand paper machines; air drying; long-sieve and round-sieve paper machines; dampening, glazing, cutting, and rolling with the proper machinery; sorting, numbering, and packing; packing presses.

Fire extinguishing (two hours in winter term). Natural and artificial extinguishing agents; water presses and hydrants; the outfit, wagon, pails, hose, engines, and their auxiliaries, ladders, etc.; demolishing tools; the service; giving the alarm; lighting; tactics for large, medium, and small fires; rescue apparatus; rescue bags, live-saving nets, lines, etc.

General electro-technique, exclusive of telegraph (three hours in winter term). Brief review of instruction in electricity and magnetism; fittings, manner of working, use, and trial of dynamo-electric machines; electric lighting and transmission of power; accumulators.

Spinning (four hours in winter term). Peculiarities of the different spun fibers and the consequent variations in the preparative and spinning process; individual machines, considering the principal points of the less easily understood mechanism; calculation of loss of power and capacity (using gauge bar); elementary theory of the flyer.

Weaving (four hours in summer term). Classification of woven goods; the simple handloom and its parts; the beginning and finishing process; coupers, dobby or treadle machines; Jacquard machines; figuring and lancing; double-woven goods; velvet, chenille, preparation for weaving, spooling, shearing, dressing, the mark, etc.; mechanical preparation with the necessary machinery; mechanical looms, arrangement, frames, motive mechanism, the mechanism for weaving of presses, guards, and harness; safety appliances; ketten and cloth beam regulations; treadle machines; drop-box lathes.

Mechanics of finishing processes (two hours in summer term). Description of the apparatus and machinery necessary in the dyeing and finishing process in weaving, especially washing, drying, wringing, strengthening, steaming, sprinkling, smoothing and polishing; fulling, roughing, shearing, etc., in different kinds of weaving.

Hosiery knitting (two hours in summer and winter term). Hand knitting, meshing of plain goods, necessary tools; kinds of hand frames; frame numbers and yarn numbers; meshing of plain and ribbed goods in hand frames; knit goods varieties (plain and ribbed); mechanical knitting (plain knitters, round and flat); ribbed knitters; knitting machines; shaping and finishing knit goods.

Finally, the students in the advanced classes of the building department may be allowed to attend the "selected lectures on particular chapters of political economy" assigned for the *Werkmeisterschule*, and also the instruction in modeling included in the course of the *Gewerbzeichenschule* (school of mechanical drawing).

The course in the *Gewerbschule* includes many branches also taken up in the other schools of the *Staatslehranstalten*, but the instruction is adapted to a different class of students, being more general and theoretical and broader in its scope, since the other schools take only so much of any science as applies to the special branch of technique studied in that department. The purpose of the schools of dyeing, building, etc., is to fit the students for skilled work in the trade, while the *Gewerbschule* aims to produce experts in the various departments of technology. There were 337 students enrolled in 1891, of whom 163 were natives of Saxony, 139 natives of other parts of Germany, and 35 foreigners, divided as follows: Austria, 5; Italy, 2; England, 2; Russia, 5; Switzerland, 1; the Netherlands, 2; Roumania, 3; America, 5.

## 2. BUILDERS' SCHOOL.

The course of study in this school is as follows:

### FIRST (WINTER) TERM.

(1) General building instruction (four hours). Consideration of the various parts and requisites of buildings in general; plans; arrangement and fittings of buildings of different designs (dwellings, agricultural, and manufacturing buildings); foundations.

(2) Elements of theory of form and architectural drawing (six hours). Joints and cornices, windows and doors; pillar arrangements, etc.; drawing practice, with lectures interspersed. (Continued in second term.)

(3) Free-hand drawing (six hours). Training eye and hand to comprehend and reproduce surface and relief ornamentation in clear outline from drawings and plaster models; practice in sketching and drawing from memory; drawing from plaster models with different shadings; designing ornaments. (Continued in second, third, and fourth terms.)

(4) Arithmetic (five hours). The four ground principles, with general and special application; potentials with integral exponents; extraction of square and cube roots; equations of first degree with one and with more than one unknown quantity.

(5) Geometry (five hours). The most important sections are congruents; equality and likeness of plane figures bounded by straight lines; theory of circles; determination of contents of plane surfaces; the most important sections of solid geometry, especially finding superficial area and contents of bodies.

(6) Theory of projection in connection with practice (eight hours). General fundamental principles of projection; projection of lines, surfaces, and bodies; cutting and penetration of bodies; shading; axonometric projection; practice in India ink.

(7) German language (four hours). Most important points in theory of words and composition; practice in oral and written expression, with special attention to spelling.

#### SECOND TERM.

(8) Stone construction (four hours). Materials; building with brick and hewn stone; stone construction of halls, etc., and their appurtenances (walls, pillars, window and door scaffolding, stone cornices, supports, etc.); stone-arch constructions, tunnels, etc., including simple stone bridges; stonecutting; stairs of hewn stone, brick and cement; stone and plaster floors. (Continued in third term.)

(9) Wood construction (four hours). Materials; simple wood construction; floors, paneled walls (timbered and ceiled), ceilings, etc.; rafters, upper and lower beams, branch sleepers, grate sleepers, truss and strut frames, etc.; form and construction of roofs, including roof coverings; stairs, doors and windows; building and arch scaffoldings. (Continued in third term.)

(10) Building laws (one hour). Reference to and explanation of police building regulations; local building ordinances; regulations concerning fire precautions.

(11) Elements of theory of form and architectural drawing (four hours). Like first term, No. 2.

(12) Designing (five hours). Beginning of designing through completion of given sketches. Designs of agricultural and manufacturing buildings, common dwelling houses, etc.; preparation of working drawings. (Continued in third and fourth terms.)

(13) Free-hand drawing (four hours). Like first term.

(14) Perspective (two hours). General ground principles of perspective.

(15) Mathematics (four hours). Review of equations of the first degree; quadratic equations; exercises.

(16) Physics (fourteen hours). General characteristics and states of aggregation of bodies, with special reference to liquid and gaseous; most important points in theory of sound, light, electricity, and magnetism; some of the important chemical experiments. (Continued in third term.)

(17) German language (four hours). Continuation of exercises; business papers and introduction to preparation of more extended compositions.

#### THIRD TERM.

(18) Stone construction (three hours). Like second term.

(19) Wood construction (three hours). Like second term.

(20) Designing (twelve hours). Like second term.

(21) Firing, heating, and ventilating apparatus (three hours). Firing apparatus in general; heating apparatus, cooking stoves, etc.; firing apparatus (for boilers); the different systems of central heating and ventilation.

(22) Free-hand drawing (four hours). Like first term.

(23) Mathematics (four hours). Trigonometry; exercises.

(24) Physics (two hours). Like second term.

(25) Mechanics (four hours). General principles; motion, force, mass, work; exercises; combination and decomposition of forces; center of gravity; stability; strength; the most important building machines; principal points of hydrostatics. (Continued in fourth term.)

(26) Field surveying, leveling, and drawing plans (three hours). Surveying building sites and small groups of buildings with chain and transit; leveling; drawing ground plans.

(27) German language (two hours). Continuation of exercises; brief survey of principal characteristics of German literature.

## FOURTH TERM.

(28) Iron construction (four hours). Materials; joining of iron; constructional parts; single and compound beams; construction of ceilings and their beams; pillars and supports; roofs, also in conjunction with wood; stairs.

(29) Designing for building construction (three hours).

(30) Building estimates (three hours). Contents and arrangement of estimates; preparing working estimates for materials and work; exercises in estimating.

(31) History of building (two hours). Development of the different styles of building and illustration of their principal and peculiar forms of architecture and ornament.

(32) Designing (sixteen hours). Like second term.

(33) Free-hand drawing (four hours). Like first term.

(34) Perspective (two hours). Exercises in perspective drawing.

(35) Mechanics (four hours). Like third term.

(36) Bookkeeping (two hours). Simple bookkeeping, with special reference to the requirements of the building trade.

Students in fourth term are admitted to the instruction in fire extinguishing of the *Werkmeisterschule*.

## 3. SCHOOL FOR MASTER WORKMEN.

This school has three departments—A, C, and D—of which A and C (mechanical technique) offer to those intending to become machine builders, masters, and superintendents in machine factories, spinning or weaving establishments, or paper factories, and to millwrights, well contractors, etc., an opportunity to acquire the necessary theoretical preparation; and department D (electro-technique) offers the same to overseers of electric plants.

The course in mechanical technique (Departments A and C) covers three terms (*Halbjahre*). Department D has, besides, a fourth term devoted exclusively to electro-technique. In this comparatively brief space of time the students can acquire only the knowledge and practice essential for their special department of work. It is not the purpose of this school to give a comprehensive scientific education.

Departments A and C begin at Easter and at Michaelmas of each year; Department D begins its special instruction only at Michaelmas. Entrance to this school is subject to the following conditions: Candidates must be at least 17 years old and vaccinated, must have the necessary preparation, and must have at least three years' experience in their trade; minors must have the consent of parents or guardians.

For intending machine builders, work in an ordinary blacksmith's shop or in the drawing department of a machine shop will be counted, but it is urgently recommended that the preparatory work be in a machine shop of middle size. For electricians practice in a mechanical workshop, in telegraph building, or electro-technical factory will serve as preparation.

Those entering must at least readily write, compose in simple German, and be able to perform easy calculations, both with common and decimal fractions. In these branches an examination is held shortly before the beginning of the term. For entrance into a higher class is required, in addition, knowledge and practice equivalent to that gained by the rest of the students in that class. For such entrance a further examination is required, which is free if taken at the time of the other examinations, but costs 5 marks if taken after the term has begun.

Application for admission must be made to the board of directors of the *Technische Staatslehranstalten*, orally or in writing, for the Easter term not later than Palm Sunday; for the Michaelmas term not later than September 15. At least a week before the examinations for entrance the following must be presented: The officially sealed or stamped birth certificate, vaccination certificate, school certifi-

ates, and certificates of all practical experience. Minors must have the written permission of parents or guardians.

All students are alike subject to the laws of the school and are responsible to the director for deportment and for preparation of assigned work. At Easter and Michaelmas a report of standing and deportment is sent to parents or guardians. A mark of less than 3 excludes from passing to the next higher class. Any student failing twice to pass must leave the school. Students leaving before the completion of the course receive a testimonial showing how long they have been members of the school, their deportment and their progress.

The tuition fee is 30 marks for each term, payable in advance at Easter and Michaelmas. Tuition paid is under no circumstances returned. Indigent and worthy students who have attended the school at least one term may, in special cases, be aided through scholarships for that purpose, and the tuition may also be remitted. Applicants for remission of tuition or aid must produce testimonials of their need to the board of directors before the beginning of the term. The expense for books, writing and drawing materials, etc., is about 30 marks a year. The directors will advise the students of families where they can obtain board and lodging, of which the necessary cost is from 600 to 800 marks a year.

Students at the Werkmeisterschule are as a rule excused from military service during the course upon application to the proper authorities. With this school are united the Färberschule and the Fachschule für Seifensieder. The courses in these latter schools begin only at Michaelmas of each year.

#### COURSE OF STUDY.

##### FIRST TERM.

*For Departments A and D—Mechanical and electrical technique (winter).*

(1) Arithmetic (six hours). The four ground principles, with ordinary numbers and letters; common and decimal fractions; proportion; theory of potentials and roots; solving equations of the first degree with one and with more than one unknown quantity, and quadratic equations with one unknown quantity, with applications.

(2) Geometry (six hours). The most important general characteristics of figures bounded by straight lines; theory of congruents; equality and resemblance; calculation of surfaces; principal characteristic of circles and of allied angular figures; calculation of circumference and area of a circle and of its dimensions; the most important propositions of solid geometry, with special attention to calculation of all the contents of bodies.

(3) Physics (four hours). General characteristics of bodies; equilibrium of liquids and gaseous bodies; heat; elements of chemistry, with special reference to burning processes. (Continued in second term, No. 14.)

(4) Geometrical drawing and projection (eight hours). Construction of plane figures bounded by straight and curved lines; perpendicular projection of points, lines, surfaces, and bodies; exercises; revolution; unrolling; sections; penetration; shading; practice in india ink.

(5) Free-hand drawing (four hours). Training the eye and hand to comprehend and reproduce simple bodies and ornaments in clear outline, partly from drawings and partly from plaster models. (Continued in No. 18.)

(6) German language (four hours). Exercise of the students in the oral and written expression of ideas by composition and extempore speaking, with following discussion; the most important parts of grammar.

*For Department C—Mechanical technique (summer).*

(7-12) Same as Nos. 1-6.

## SECOND TERM.

*For Departments A and D—Mechanical and electrical technique (summer).*

(13) Mathematics and mechanics (eight hours). Logarithms; elements of plane trigonometry; theory of curves as far as it is necessary to the understanding of mechanics; theory of equilibrium and movement of material points and rigid bodies, frictional resistance, rigidity—all treated in an elementary way and limited to the points especially necessary in the technical application, paying special attention to graphical methods.

(14) Physics (two hours). Continued from first term, No. 3.

(15) Machine theory (two hours). Machine elements and organism, in the treatment of which geometrical knowledge or the application of theoretical mechanics is required only to a limited degree; bases; couplings; cogs; belts; engine driving.

(16) Mechanical technology (four hours). Working of metals, particularly of iron, and of wood.

(17) Machine drawing (eight hours). Preparation of drawings, especially of working drawings, of simple machine parts, bases, coupling, wheels, belt shears, pistons, packing boxes, windlasses, connecting heads, crossheads, valves, etc.

(18) Free-hand drawing (four hours). Continuation of No. 5.

(19) German language (four hours). Practice, particularly in business papers, writings, easy negotiations, etc.; practice in extempore speaking, together with taking notes; the most important sections of the history of German literature.

(20) Field and water surveying (four hours). Description, trial, and application of the simplest surveying instruments; surveying real estate; calculation of areas; leveling of points, lines, and surfaces; water surveying through gauging floats and overflow.

*For Department D—Electrical technique (summer term).*

(21) Electricity (two hours). Elements of frictional electricity; galvanism; magnetism and electro-magnetism.

*For Department C—Mechanical technique (winter term).*

(22-28) Same as Nos. 13-19.

## THIRD TERM.

*For Departments A and D—Mechanical and electrical technique (winter).*

(29) Mechanics (four hours). Continuation of theory of rigidity; theory of rigidity and motion of liquid and gaseous bodies, so far as necessary for the instruction in machine theory.

(30) Machine theory (six hours). Continuation of the like instruction in second term; screws; rivets; pins; shafts; belt and rope sheaves; wheels; also lifting tools and power machines. (All instruction elementary.)

(31) Machine drawing (eight hours). Designing machine parts and simple machines; preparing of the proper working drawings. (Reference is had so far as possible to the future work of the student.)

(32) Free-hand drawing (four hours). Making drawings, with shading, from plaster models.

(33) German language (two hours).

(34) Business bookkeeping (two hours). Exercises in preparation of the necessary books, so that they form a complete set and show at once the profit or loss; instruction in the most necessary characteristics of exchange, with reference to the requirements of general commercial law; the German exchange ordinances and the credit ordinance of the German Empire.

(35) Building, including drawing (four hours). Building; wall construction; inclosing of rooms; vaulted arches and their construction; door and window open-

ings; stone ceiling; simple arches; chimneys; wood construction (beams, sleepers, etc., their supports); roofs with and without supporting timbers, with truss and strut frames, etc.; roof covering; stairs; building site; foundations; drawings connected with the subject, including small buildings, from given plans and original.

*For Department D—Electrical technique (winter).*

(36) General electro-technique (three hours). Brief review of theory of electricity and magnetism; fitting up, manner of working, application, and inspection of dynamo-electric machines; electric lighting and transmission of power; accumulators.

(37) Telegraphy and telephony (two hours). Detailed treatment of house telegraph and telephone plants; most important of the various telegraphs and telephones. (Continued in fourth term, No 46.)

*For Department C—Mechanical technique (summer).*

(38-44) Same as Nos. 29-35.

(45) Same as No. 20.

#### FOURTH TERM.

*For Department D—Electrical technique (summer).*

(46) Telegraphy and telephony (two hours). Continuation of No. 37.

(47) Special electro-technique (four hours). Most important of electro-technical measuring instruments and methods; continuous-current machines; outfit and working of simple electric-lighting plants.

(48) Practical work in the laboratory (sixteen hours). Measuring of strength of currents; resistance and tension of conductors; testing and gauging technical measuring instruments; testing electro-technical conduction apparatus; regulating arc lamps; simple measurements on dynamos and accumulators and on such powerful-current plants as are available.

Students in second, third, and fourth terms are also given the same opportunity for instruction in special branches as in the third course of the Gewerbschule.

#### 4. SCHOOL FOR MILLERS.

The course of study in this school is as follows:

##### FIRST TERM.

(1) Milling in general (four hours). Practical part—the systems of measures, weights, and standards in the other countries most important to the trade; estimates of price according to quality of grain; statistics of granaries and grain trade. Technical part (continued as mill-building in second term, No. 10)—systems of grinding, with their special arrangement of machinery and transportation; transporting, lifting, and weighing appliances of mills; effectiveness and expenditure of power of different milling apparatus; machines for cleaning the grain, etc.; fanning, hulling and brush machines, etc.

(2) History of milling products in nature (two hours). Treatment of the elements and chemical treatment most important to plant life; analysis of grains, microscopic examination of their structure; flour, dough-making and baking processes; determination of gluten and flour inspection.

(3) Mathematics and mechanics (eight hours). Logarithms; elements of plane trigonometry; theory of curves so far as necessary to understanding of mechanics; theory of equilibrium and motion of material points and of rigid bodies; frictional resistance; strength. (Treatment elementary and limited by the demand of the practical application.)

(4) Physics (four hours). Theory of heat.

(5) Machine theory. (Same as Werkmeisterschule, No. 9.)

(6) Machine drawing (eight hours). Preparation of working drawings of simple transporting and milling machine parts.

(7) Free-hand drawing (two hours).

(8) German language (four hours). Exercise in preparation of business papers; technological descriptions, etc.; exercise in extempore speaking, with taking notes; most important sections of history of German literature.

(9) Field and water surveying (four hours). Handling of the simplest surveying instruments for laying out mill pits, mill ponds, etc.; leveling; water surveying through gauges, floats, etc.

#### SECOND TERM.

(10) Mill building (four hours). Pulverizing machines, cylinders, swing mills, millstones; setting up, adjusting, and cutting millstones; grinding and rifling machines for cylinders; cylinder sieves, etc.; machines for cleaning the meal, mixing and packing flour; transporting apparatus, with reference to the motor and grinding system.

(11) Mechanics (four hours). Same as *Werkmeisterschule*, No. 15; also weirs and mill pits.

(12) Machine theory (six hours). Continuation of No. 5; valves; shafts; toothed wheels; water wheels; turbines; steam boilers; steam engines.

(13) Machine drawing (eight hours). Drawing from examples and plans of different milling machinery and tools; designing water wheels; plans of mill apparatus from drawings.

(14) Free-hand drawing (two hours). Continuation of No. 7; making and shading drawings from plaster models.

(15) Building (one hour). Window openings, stone ceilings, simple arches; chimneys, wood joining, sleepers, beams, etc., and their supports; roofs, with their supports; roof construction with truss and strut frames, etc.; stairs; building site; foundation.

(16) Building drawings (one hour). Drawing of small buildings from given designs and original.

(17) German language (two hours). Continuation of No. 8.

(18) Business bookkeeping (two hours). Points most important to the students. Students are also admitted to certain departments of the *Werkmeisterschule*.

#### 5. SCHOOL FOR DYERS.

The following is the course of study in this school:

##### FIRST (WINTER) TERM.

(1) Chemistry (twelve hours). Fundamental principles; most important chemical elements and their compounds, with special reference to those important for practical and laboratory work; introduction to organic chemistry; glance at the more important carbon compounds.

(2) Physics (four hours). General characteristics of bodies; different states of aggregation; most important points in theory of equilibrium and of movement of solid, liquid, and gaseous bodies.

(3) Arithmetic (six hours). The four ground principles, with ordinary numbers and letters; common and decimal fractions; proportion; theory of potentials and roots; solving of equations of first degree with one unknown quantity.

(4) Geometry (two hours). Most important points of plane geometry; calculation of surface and contents.

(5) Free-hand drawing (four hours). Training the eye and hand to comprehend and reproduce objects of simple form; training the taste for decoration and color combination. (Continued in No. 11.)

(6) German language (four hours). Exercises in oral and written expression of ideas by compositions and extempore speaking, with criticism; most important points of the language.

## SECOND (SUMMER) TERM.

(7) Chemical technology (four hours). Water, its circulation in nature (rain, spring, and river water), hard and soft water, purifying for industrial use, etc.; materials used in dyeing and soap making, as salt, soda, potash, and caustic alkalies, acids, etc.; heating and lighting materials; firing apparatus.

(8) Technical chemistry (two hours). Fats; soaps; maceration; thickening and finishing processes. (Continued in third term.)

(9) Practical chemical work in the laboratory (sixteen hours). Exercises in qualitative analysis; illustrations of preparations; carrying out easy quantitative determinations; determination of value of soda, potash, etc. .

(10) Physics (two hours). Theory of heat; optics.

(11) Free-hand drawing (two hours). Continuation of No. 5.

(12) German language (four hours). Preparation of business papers, technological description, etc.; exercise in extempore speaking and taking notes; most important sections of history of German literature.

## THIRD TERM.

(13) Business bookkeeping (two hours). Practice in preparation of the necessary business books, so that they shall form a complete set and show at a glance the profit and loss; necessary instruction in peculiarities of exchange, with reference to the decision of the general commercial laws and the exchange.

(14) Dye-school mechanics of finishing process (two hours). Same as in Gewerbschule.

(15) Technical chemistry (six hours). Continuation of No. 8; characteristics; illustration of and elements of application of dyestuffs and dyeing materials; preparation of fibers and tissues for dyeing and pressing; bleaching of cotton, linen, jute, wool, and silk; drying and finishing wool and silk; application of the dyestuffs; vat dyeing; blue print; Turkey-red dyeing; alizarine and aniline black prints, etc.; machines used in bleaching, dyeing, printing, and finishing; preparation of dyed and printed wares; theory of dyeing; preparing and working of dyeing, washing, and fulling water.

(16) Practical chemical work in the laboratory (twenty hours). Continuation of No. 9; qualitative and quantitative analysis; testing and determining the value of soaps, fats, etc.; practical work to familiarize the students with the composition of the most important fats and soaps, and the other materials used in manufacture of pomades, etc., in conclusion of No. 14.

(17) Free-hand drawing (two hours). Continuation of No. 11.

(18) German language (two hours). Continuation of No. 12.

## ADDITIONAL ADVANTAGES.

Students are allowed to avail themselves of the instruction in the following branches in the course of the Werkmeisterschule (see course of study):

(19) Waterworks construction (two hours in summer term).

(20) Electrical theory (two hours).

(21) Weaving (four hours).

(22) Spinning (four hours in winter term).

(23) Fire extinguishing (two hours).

(24) Knitting (two hours, summer and winter term).

(25) Electro-technique (three hours in winter term).

(26) Political economy (two hours). Selected lectures in summer term.

## 6. SOAP-MAKING SCHOOL.

The course of study in this school is as follows:

## FIRST TERM.

(1-6) Same as in the dye school (preceding).

## SECOND TERM.

(7) Same as in dye school.

(8) Technical chemistry, part 1 (two hours). Organic compounds and materials most important in making of pomades, etc., and in soap making, especially fats and their ingredients; dyes and scents used in soap making.

(9-13) Same as in dye school.

## THIRD TERM.

(14) Technical chemistry, part 1 (six hours). Continuation of No. 8; use of fats, especially soap making; obtaining and purifying the fats; their characteristics; apparatus and machinery necessary in making household and toilet soaps; different kinds of soap; scents for toilet soap; candle making; inspection of fats and soaps.

(15-17) Same as 16-18 in dye school.

All students in the second and third terms are allowed to avail themselves of the instruction in the following subjects in the course of the *Werkmeisterschule*:

(18) Waterworks construction (two hours in summer term).

(19) Electrical theory (two hours).

(20) Electro-technique (three hours in winter term).

(21) Fire extinguishing (two hours).

(22) Selected lectures on special chapters of political economy (two hours in summer term).

## 7. MECHANICAL DRAWING SCHOOL.

The course of study in this school is as follows:

(1) Free-hand drawing (four hours per week).

(2) Geometrical drawing (four hours per week).

(3) Projection (four hours per week).

(4) Modeling (four hours per week).

## WEAVING SCHOOL.

This school, as its name implies, is devoted exclusively to weaving in all its branches. It was founded in 1857. In 1886 there were 61 students, of whom 39 were from Germany (16 from Saxony), 13 from Austria, 1 from Italy, 6 from Russia, 1 from Denmark, and 1 from the United States. In 1891 there were 60 students, of whom 43 were from Germany (27 from Saxony), 9 from Austria, and 8 from Russia.

There are three scholarships which pay all fees for the holders, and one fund by which tuition may be partially remitted for indigent and worthy students. The tuition is: For Germans, 270 marks; for others, 450 marks; and a charge of 30 marks is made for yarn, patterns, etc. Prizes are given for progress and good behavior. The school provides for the use of the students 43 handlooms and 16 machine looms, with the necessary preparatory looms and machinery. There is also a collection of spinning and weaving materials and a number of books of drawing patterns, besides a library of works and magazines on weaving. In 1891 the school was visited and the course of instruction studied by a large deputation from Manchester, England, and by a deputation from the Labor Bureau at Washington.

The course covers one year and is divided into two terms, one beginning at Easter and the other at Michaelmas.

The course of study is as follows:

## FIRST TERM.

(1) Lectures on weaving materials and on the construction and system of the different handlooms and supplementary weaving tools (four hours per week).

(2) Analysis of materials for Dobby and, as far as possible, for Jacquard looms; preparation of the accompanying pattern designs and calculations, together with the necessary instruction on loom appliances and finishing (sixteen hours per week).

(3) Practical exercises in Dobby weaving (eight hours).

- (4) Theory of composition (two hours).
- (5) Lectures on machine elements and motors; preparation of drawing for the instruction in mechanical weaving (four hours).
- (6) Instruction in sketching machine parts and free-hand drawing (four hours).

## SECOND TERM.

- (1) Lectures on machine looms and the preparatory and auxiliary machines used in mechanical weaving (eight hours).
- (2) Practical exercises in mechanical weaving (eight hours).
- (3) Theory of composition (two hours).
- (4) Analysis of Jacquard goods, of velvets, gauzes, ribbons, etc., together with the necessary instruction on loom appliances and finishing (eight hours).
- (5) Lectures on construction and mechanism of the Jacquard loom and of other complex loom appliances (two hours).
- (6) Practical instruction in Jacquard weaving, including velvets, gauzes, ribbons, etc. (six hours).
- (7) Free-hand drawing; arrangement of colored patterns; introduction to designing (four hours).

## IV.—RURAL OR UNGRADED SCHOOLS IN GERMANY.

## INTRODUCTION.

The animated and timely discussion of the question of improving the ungraded schools of this country suggests an inspection of such schools in Germany. It was publicly asserted in *The Forum* (October, 1895) that—

The American farmer of two generations ago was a better educated man than is the American farmer of to-day. No one would ever have thought of calling him a peasant. He did not suggest such a thing in his manner of life, poor though it was; nor yet in his manner of thinking, though that may have been narrow. Let any candid observer go into a neighborhood where the land has been tilled by the same family for generations and let him find a farm where there are still three generations upon it. He is almost sure to find that those of the oldest generations can speak, write, and think with more accuracy than the second generation, and that the second generation will show more evidences of education than the third. This shows degeneration, and this degeneration can be directly traced to the decadence of the country public schools, which now are really beneath discussion, were there not a hope that by telling of their badness some interest might be excited, and that through this interest they might be improved.

This assertion by John Gilmer Speed is by no means an isolated one. The National Educational Association has recognized the necessity of

doing something to improve the rural school, and appointed a committee of twelve to prepare a report on the subject.

People who are acquainted with rural schools in Germany know that the difference in results between the urban and the rural elementary is not great. In the western parts of the Empire it is scarcely noticeable, because both kinds of schools virtually follow the same course of study prescribed by the Government, and the teachers of city and rural schools virtually receive the same professional training. Graduates of normal schools (so it was decreed recently in Prussia) are preferably employed in cities first, where, under the leadership of experienced principals and school inspectors, they may gain experience before they are placed in responsible positions in village schools. Thus it is seen that the Government considers the rural schools of equal, if not greater, value than the city schools.

#### THE RURAL SCHOOL IN GERMANY.

In order to present the scope and work of rural schools in Germany, the substance of an article by Mr. F. Hollkamm, a German teacher, is here inserted, which was prepared for Rein's *Encyclopaedisches Handbuch der Paedagogik*.<sup>1</sup>

(1) *Definition*.—The term "ungraded schools" means those institutions in which all children of school age of a school district are seated in one schoolroom and are taught by one teacher.

(2) *Name*.—This kind of school is variously named: "Gesamtschule" in Switzerland, "one-teacher school" in Bavaria, "one-class school" in Prussia, "ungraded school" in United States.

(3) *Varieties*.—These names indicate the two chief varieties of rural schools. In Switzerland and the United States all the pupils are

---

<sup>1</sup> It is explicitly stated here that the use of the monitorial system described in this article is nowhere in Germany required by governmental decree, but it is the result of circumstances and custom. If a teacher is placed face to face with the task of teaching and disciplining 80 or more children he of necessity resorts to the make-shift of calling in the help of his older pupils. Ever since the inauguration of the system of compulsory education the rural teachers in Prussia have resorted to the employment of monitors, and in the following article it is shown how systematically and successfully it can be done.

It is also desirable to state that no pedagogical idea has aided the work in rural schools more than the idea of concentration as advanced by the disciples of Herbart. It is safe to say that rural school-teachers in Germany generally follow some system of correlating the branches of study by grouping them as well as their classes. As no governmental decree prescribes the method of instruction to be followed, the popularity of Herbart's pedagogy among the elementary school-teachers in Germany is very extended. The author of the article quoted in this chapter, Mr. F. Hollkamm, presents the features of German rural schools customary in many places. This is stated so as to leave no chance for any misunderstanding which might arise from the supposition that this article was an official report. The *Encyclopedia* of Professor Rein, for which Mr. Hollkamm furnished his article, is a most authoritative work of very recent origin.

present at all hours of the daily school session; in Bavaria, Prussia, and other German States the whole bulk of the pupils are together in one room only through a few lessons, while during a part of the day the advanced pupils are taught alone. In some parts of Germany the teacher devotes half the day to the primary and the other half to the advanced classes. Wherever such a separation of pupils into classes takes place the school is, strictly speaking, not an ungraded or one-class school any longer, for the use of the same room and the employment of the same teacher for both sections are unessential characteristics of the technical term "class." In this case the school is graded into a lower and upper grade, although taught by one teacher.

(4) *Deficiencies and advantages.*—It is obvious that the ungraded school, being the simplest and most incomplete form of school, must show many deficiencies. Since it is impossible to teach simultaneously the pupils of seven or eight yearly grades attending the school, they must be divided into sections, of which one is taught at a time, while the others are kept busy with written work or study of text-books. This seriously endangers the discipline, because pupils who have little inducement to work by themselves, and think themselves unobserved, tend toward infraction of the rules, and also because the simultaneous work of several grades in the same room is apt to divert the attention and lead to disorder. Instruction and learning under such circumstances can not be all-absorbing. Constant and unavoidable noise caused by slate work and movements made by active children disturb the lesson of the class just then reciting. The time given to each section is necessarily divided into fractions. According to the number of sections, "lesson hours" shrink to half hours, thirds, or quarters, and the time lost in changing classes and assigning lessons is considerable. Likewise the teacher's force is frittered away, especially if we consider the time it takes for the preparation of each day's work and for correcting pupils' written work after school hours. While the teacher hears lessons he must have his eye on the other sections engaged in work in their seats. If the time is short the work assigned has to be carefully measured off, so as to afford occupation without calling for undue strain. The teacher must hear all his classes or sections every day, and most of them two or three times. This leaves him not a minute of rest from the arduous duties of oral teaching.

Despite this dividing the time and the teacher's strength the pupil's individuality can not be cared for sufficiently. The differences of the pupils' individualities are greater than in other schools, since the rural school is attended by children of all ages (between 6 and 14), by all social strata, and by both sexes. The grading within the rural school can not be continued sufficiently to do justice to the difference in age, not to speak of other considerations, such as arise from the pupils' sex. Hence there becomes necessary during the actual lessons a high moral pressure which diminishes the interest. The more sections or classes

a teacher makes the less pressure is felt by each pupil; but in the same proportion in which this pressure is lessened the frittering away of time and strength increases. The reverse takes place if the number of classes is decreased. Injury to the instruction is unavoidable in either case.

These deficiencies or defects are offset by great advantages which may be traced back to three chief factors: First the family-like character of such a school; second, the facilities for intimate intercourse between teacher and community (or school and home), and third, the unity of the educational institution, which affords the rural teacher (who, as a rule, in Germany is a permanent officer) opportunity to watch the development of his pupils from infancy to maturity.

The first cause gives the teacher opportunities to influence one pupil by another; hence, both in regard to intellectual work and in the upbuilding of character, he is enabled to stimulate the individuality of his pupils and employ methods of procedure which resemble the mutual influence exercised by the members of a family upon one another.

The second cause enables him to influence the parents in behalf of their children. If the teacher enjoys the confidence of the parental home, he will not find it difficult to work toward better home training of his pupils and to aid the parents in the supervision of home work and in rendering assistance to weak pupils.

The best feature of the unclassified school, however, is its unity. This gives the teacher a liberty of movement and action which no teacher in graded schools can enjoy. To remove inconveniences, to institute improvements, etc., is possible to the teacher of the ungraded school, while the teacher of the graded school has to consult other teachers, the principal, and perhaps higher authorities besides, before he can make any changes. If, for instance, the progress made in one branch seems inadequate, the teacher, "who is master of all he surveys" and shares his authority with no one, can equalize the difference by giving more attention and time to that branch. He can aid a talented child to do justice to its natural gifts, and can help slow pupils to progress more quickly. He can exercise an influence upon his pupils for eight years. During such a long period the individuality of a child can be studied and impressed, and bad tendencies can be counteracted better than in schools where a teacher has his pupils just one year and then hands them over to another teacher. Instruction and ethical training both gain in intensity in a school in which the teacher acts in the rôle of father and mother for eight years. It is a weighty argument to know that the execution of the entire educational plan lies in the hand of him who planned it. Pedagogical demands, with reference to preparation, apperception, and concentration, can be heeded without difficulty. In regard to training, it is worth considering that the pupil accustoms himself, during a period of eight years, to the

peculiarities of his teacher, and not having opportunities to compare him with others he does not easily discover his weaknesses. Finally, the unity of the entire educational apparatus represented in the ungraded school causes in the teacher a feeling of increased responsibility. He himself reaps the fruit of well-performed labor, and for want of success he can not make others responsible.

Some advantages of more external character are derived from the division of the school into sections. The latter coincide with the grades of a city school, but their number of pupils is much smaller. Hence the individual pupils are strained, and their attention is taxed more in a brief period of time each day than the pupils of a graded school. A quarter of an hour devoted to 10 or 12 pupils may secure as great a result as a whole hour devoted to 70 pupils. At least there is no reason to think that the difference will be very great.

In weighing the advantages and disadvantages of an ungraded school two things should be considered: First, real defects exist side by side with undoubted excellencies. The latter must be utilized; the former can only be palliated, but not entirely removed. How to do this depends upon the personality of the teacher. On the other hand, the very defects of the schools are a constant check to all kinds of extravagancies in the teacher's methods. They oblige the teacher to prepare himself thoroughly, to be brief in his explanations, to restrict himself to that which is most necessary and essential in the selection of matter, and to give a broad margin to exercises and the practice of the matter learned. Self-activity on the part of the pupil is the necessary presupposition for the success of the ungraded school. That through its imperfections it obliges the teacher to foster self-activity in the pupil is one of the best features of this school.

(5) *Organization*.—In organizing an ungraded school the first thing to be done is the division of the pupils into sections; the next, to properly select pupil-teachers or "helpers" from among the most advanced and reliable pupils, and third, to institute a system of occupations for all sections that are not reciting to the teacher or to a helper.

(a) In dividing the whole school into sections several things have to be considered. If the individuality of the children is to be properly regarded, if a large amount of matter is to be thoroughly worked over, many divisions or sections are needed; the least number would be seven or eight. If, however, the frittering of time and strength is thought of, and skill and circumspection wanted in keeping occupied all sections not under immediate supervision; if the disturbances arising from frequent changes of classes and occupations are dreaded, it would seem as though two or three sections were preferable. Hence the following compromise between the different considerations may be recommended: The differences in natural gifts are, as experience teaches, greatest during the first year of school; besides, the "road to learning" is narrow in the beginning, and progress rapid;

hence the first-year pupils should form one class. During the next few years an equalization takes place between the differences in individuality; the "road" and the horizon widen, and progress is slower; reviews are here easy, hence two yearly classes may be combined without detriment to the pupils. In schools of an eight-year course the pupils of the last three years might safely be combined into one section. This would give the following combination:

First year = Class or Section I.

Second and third years = Class or Section II.

Fourth and fifth years = Class or Section III.

Sixth, seventh, and eighth years = Class or Section IV.

This combination is permanent, and holds good for all the branches. Only in singing, and possibly in other minor branches, the whole school or several classes may be thrown together. In assigning work to be done by the pupils in their seats, it must be arranged so as to increase both the difficulties and the amount of work as the class advances in years.

(b) The employment of pupils for the purpose of aiding the teacher in keeping order and supervising the work is called the monitorial system. Pupils who help to keep order in school and on the playground are simply monitors. If they are called upon to aid other pupils in their work, or hear them recite, they are pupil-teachers. These are sometimes assigned to aid individual pupils in seat work in which they find particular difficulties—in that case they are silent helpers; or they may at times be assigned to hear an entire class of not more than ten pupils recite—in that case they act as teachers. They may hear a class in spelling or reading, or recite memorized poems; they may narrate stories for composition exercises, review lessons heard from the teacher himself, dictate sentences or words, and conduct lessons in penmanship. In short, they may be employed as assistants in various branches and occupations. Monitors may be used in graded schools also, but pupil-teachers are a specialty of ungraded schools.

The propriety of employing pupil-teachers has often been doubted. It has been said, pupils are incapable of giving instruction. They disturb with their work the repose of the schoolroom and enter as confusing elements in the personal intercourse between teacher and pupils. The latter objection holds good only if, as was done in the Bell-Lancaster schools, the system of pupil-teachers is unduly extended, so that the teacher becomes a mere overseer of a knowledge shop. It is true, pupils are not capable of giving instruction according to educational principles, since they lack the requisite knowledge of psychology and pedagogy. But instruction implies a variety of work for the purpose of practice, for which merely a steadfast adherence to duty is needed. This refers chiefly to written exercises, reviews, and application of things learned during lessons. The weightiest consideration is the noise and

commotion caused by the pupil-teachers. This will lead to a restriction of the system in small, inconvenient rooms; but in spacious school-rooms, especially schools that are provided with vestibules, anterooms, and cloakrooms, the system of pupil-teachers may be employed to advantage.

The desirability of employing pupil-teachers<sup>1</sup> arises from the necessity of shortening the time of silent study or written work. If the school is divided into four sections the teacher can devote only fifteen minutes per hour to each section; hence each section has forty-five minutes per hour for work in their seats. If pupil-teachers are employed this period of forty-five minutes may properly be abbreviated to thirty minutes, besides making the pupils perform more work—that is, employ their time more profitably. The exercise or application of matters learned during oral lessons with the teacher becomes more thorough, hence self-activity on the part of the pupils is promoted by the silent occupation following. Above all, employing pupil-teachers affords all the pupils better opportunities to use their tongues. It is torture for a child to keep silent for three-quarters of an hour, and it may injure the development of his command of language.

Pupil-teachers are not to be employed indiscriminately. In important branches, where facts are transmitted and emotions are awakened, like religion, natural history and natural science, geography and history, the work of the teacher will have to be very prominent, while in other branches where skill of performance is the main point, like reading, grammar, spelling, penmanship, and drawing, as well as arithmetic (especially written), the pupil-teacher can serve most acceptably.

Monitors for keeping order may be taken from any section except the lowest. Pupil-teachers must invariably be taken from the most advanced section. In order not to retard the progress of any pupil-teacher in his own work, it must be the rule never to assign a pupil to teachers' duties while his own class is reciting to the teacher or receiving instruction from him. The benefits accruing from duties as pupil-teachers are very material. They are chiefly found in the review of the pupil's own knowledge. The time they lose from that devoted to silent work is fully made up by the thoroughness these reviews secure; moreover, a sensible teacher will choose the most talented of his advanced pupils, who rarely need as much time for silent work as the average pupils.

In order to make the system successful, it is imperative to give the pupil-teachers special instructions as to how to proceed. If this claims more time than brief orders will take, it is well to call them to the teacher's desk during recess, or before and after the daily sessions, and give them specific instructions. Even written preparation is advisable

---

<sup>1</sup> A number of authoritative expressions on the subject of monitorial or mutual instruction, often called the Bell-Lancaster system, is appended at the close of this article. They are translated from the German.

by using "class journals" and "question books," which contain notes as to the order of procedure and leading questions concerning the matter to be gone over. These questions (together with the answers) should be carefully gone over with the pupil-teachers, so as to enable them to conduct miniature recitations. The questions consist of main and subordinate questions, which may be designated as such by marginal notes or marks. The tasks assigned to the pupil-teachers are to be frequently changed, lest they result in parrot-like repetition. There are several models of question books for pupil-teachers published in Germany, of which Dörpfeld's are considered the best.

(c) The silent occupations (seat work) may be written or mental. We class among the first: Copying, writing from memory, composition and other language work, correction of written work, map drawing, drawing of sketches in connection with nature study and geography, other drawing work, penmanship, writing music, and work in arithmetic. Mental occupation may consist of reading, recalling narrations, search in dictionary, map reading, reading of music, and memorizing poems or other matter. Both occupations have their merits and demerits. The written work, is easier to control, but causes more noise than exclusively mental work which requires a high degree of skill in reading if it is to be performed in absolute quietude. Mental work is not easily gauged by results.

The two kinds of occupation are to be carefully prepared, both by the teacher during his lessons, and the pupil-teacher after school hours. They must be adapted to the capacity of the pupil. The teacher is obliged to consider the combination in class of pupils of two yearly courses; that is, require increased work of the elder section of that class. At times he will present particular difficulties to the most talented of his pupils, and ease the work of weaker ones. Best adapted for pupil-teachers' work are exercises that require no lengthy explanations and may be extended or broken off at will, as for instance written number work. It is at all times imperative to leave no work uninspected. If much more time is needed for inspection of the written work than can be spared from the teacher's lessons, he must do it after school hours or during recess. Frequently an immediate inspection is necessary and can be performed by a pupil-teacher, but great care is required in the selection of that particular pupil in order to prevent deception. As far as possible the written work should be facilitated by preventing errors, rather than correcting errors after they are made. To look over the pupils' written work carefully means the loss of much of the teacher's valuable time, yet, if he leave this work undone, he would cause injury by this omission.

If at times no chance is offered a class for silent occupation or other work, it would seem preferable to dismiss that class. This case often happens with the primer class shortly after their admission to school. It may be well at times to allow a class to listen to the recitation of

another, instead of giving them work to do; for instance, during recitations of poems and narrations, reading of composition, etc., other classes may listen. In a few cases the teacher may occupy two sections simultaneously. He may hear one class in grammar and dictate words for spelling to another. Lessons in mental arithmetic may be carried on with two sections. However, such double work is rather objectionable, owing to its difficulty. A commendable method of abbreviating the time for silent work consists in calling for aid upon a next higher class to present new matter to the lower. This takes a burden from the teacher and offers opportunity to the pupil for a thorough review of some particular point. Of course the most radical means for the abbreviation of the time for silent work is the diminution of the number of sections, but since that can not be well done owing to reasons advanced before, the teacher may vary the number of sections according to the branch under treatment; for instance, in reading not so many sections are needed as in arithmetic. However, such variations must be left entirely to the good judgment of the teacher, who must needs be professionally prepared.

(6) *Course of study*.—Making a course of study for an ungraded school involves two chief considerations, selection and order of branches. With reference to the selection—that is, “The what and the how much” of any subject prescribed—few suggestions can be made. With reference to the order in which the branches are to be taken up, the question arises, “What modifications of the pedagogical demands for the arrangement of matter are needed in order to do justice to the peculiar conditions of the ungraded school?” In the further discussion of this question a sketch of a course of study may show the practical execution of proposed plans.

(a) Since the ungraded school, like all other educational institutions, is to generate many-sided interest, it follows that the course of study must be relatively complete. A complete course of study will contain the branches representing nature-study as well as culture-studies. It will never be profitable to cut out such branches as history, natural history, and geography, and restrict the work to religion, language, arithmetic, and singing, in order to gain time. The same demand for many-sided interest will call for the insertion of art instruction; hence drawing and music must be included. Sufficient time must be devoted to literature, by treating poems and prose pieces not merely from a grammatical, but from a literary standpoint. Again, in the unclassified and in all other educational institutions, the object of which is to educate and train, and not merely to transmit knowledge, a consideration for the individuality and the environment of the pupil will have its effect upon the selection of matter. The fact that children of the ungraded rural school are in more intimate connection with nature and its phenomena than city children will have weight in the selection of subjects for nature-study. Again, the fact that in the greater number

of rural communities dialects are spoken instead of high German, calls for special attention to language studies. Arithmetic and geometry, penmanship and gymnastics, can of necessity not be omitted from the studies of the ungraded school.

(b) When considering the amount of matter selected the teacher has to guard himself from going to extremes. If he selects too much, he is apt to treat all subjects superficially, owing to the want of time devoted to lessons and recitations conducted by himself; nor can he thoroughly ingraft facts upon the minds of his pupils. Interest can arise only from firmly rooted and well grouped concepts. On the other hand, if the amount of matter is very much restricted it will not generate an interest, because a certain number of concepts are needed for that purpose. Interest will be weak where it is not fed by a wealth of concepts. In order to avoid the dangers of both extremes, the course of study must contain some matter from all the branches mentioned. Three methods for maintaining the pupils' many-sided interest may be mentioned: First, the amount of matter in the various branches may be diminished according to their importance, but not at the beginning, when the principles and fundamental facts are presented, but rather higher in the course. Second, by prudent arrangement of lessons and intimate correlation of matter time and strength may be saved. Finally, in every branch of the course the points which are of typical importance, and hence may serve as centers for less important matters, should be treated thoroughly and practiced more frequently. For instance, in arithmetic it is vital to let the pupils understand that "5 per cent" is a common fraction and means one-twentieth. Exercises that will make this clear beyond doubt are more necessary than all the many "cases" developed from different conditions or points of view. If, in biblical history, the story of Joseph up to his elevation in Egypt is treated thoroughly, the journey of the brothers need be only read or narrated. In natural history the dog is studied minutely, while wolf and fox, representatives of the same class, need less attention. The main items of any series of concepts must serve to generate the interest; minor matters serve to correlate and establish connection. These three methods lead us to special questions concerning the course of study.

(c) The science of pedagogy rejects the formerly customary aggregate of branches called a course of study and demands a plan which is unified and systematically arranged. According to this plan, furnished by Ziller and his disciples, the order of the matter taken up is according to steps analogous to the history of culture. This is not the place to discuss the relative value of this arrangement. Let it be said that Ziller's plan does more justice to pedagogical demands with regard to preparation, apperception, and concentration of instruction than the commonly advocated arrangement according to concentric circles. The latter arrangement serves the acquisition of knowledge, while the

former aims at ennobling and training the pupil's emotion and will as well as intellect.

Since it is obvious at first glance that the complicated plan of Ziller in its original form, intended for schools of eight grades, can not be applied in the ungraded school, the question arises how it may be modified to suit the occasion.

In "Gesinnungsunterricht" (influence upon the sentiments and heart), the last of the eight groups of Ziller, that referring to the catechism may be omitted. This group does not represent a special step in culture. A systematic connection of the catechism with biblical history is easily established and may find its conclusion in the history of the Apostles. On the other hand, the ungraded school can not do without fairy stories and Robinson Crusoe. This school receives its children chiefly from among peasants and the poor farmers, in whose homes a true family life is rarely found, owing to the variety of duties that both father and mother are obliged to pursue. The result is, that the children come to school with very imperfect language and almost void of important concepts. Their religious horizon of concepts is particularly limited, hence much attention to biblical history during the first two school years can not be advised. Narrations of the life of Jesus will awaken a religious feeling and primary concepts. Then, by means of narrations, such as fairy stories and the adventures of Robinson Crusoe, the children's language is improved and their thought concepts increased. In connection with this work a limited number of ethical concepts are awakened. Then may follow a discussion of biblical stories in accordance with the given steps of the history of culture. First, the time of the Patriarchs; second, the Judges; third, the Kings; fourth, the life of Jesus; fifth, the time of the Apostles. The three periods of the Old Testament should claim about equal time with the two periods of the New Testament. The life of Jesus should at all times be the most important part of religious instruction.

Analogous to the series of concepts awakened in the "Gesinnungsunterricht," the matter in the other branches is to be simplified. In history the events of modern times will naturally be treated slightly. During the earlier school years fairy stories and the adventures of Robinson Crusoe will replace the historical instruction. For the preparation of the three periods of German history—namely, the time of the kings, the reformation, and modern times—it will be sufficient in ungraded schools to touch upon the "Nibelungensaga," which may represent the heroic time of the nation. The Thuringian stories may be omitted and be replaced by home stories, which may be offered in connection with home geography. For the study of nature the two steps—the time of the shepherds and agriculture—should be treated more thoroughly. The discussion of the time of hunting may follow in connection with so-called object lessons preparatory to the study of nature and geography. The industrial step and a discussion of technology,

physics, and chemistry deserve relatively little time and attention. Geography should consider the description of home and fatherland as well as the continent of Europe; other continents are studied only in connection with history. Points which are of importance in connection with historical events should be found on the map. In language instruction the teacher should restrict himself to prose pieces of epic character and to poems of epic and lyric contents. The step called "dramatic" poetry might be omitted or only touched upon in connection with model pieces from the reader. The principle prescribed by the Government that grammar and spelling should be limited to suit existing local circumstances is particularly important for ungraded schools. Instruction in drawing must, as Menard conclusively proves, have an independent field for its choice of matter, but even this matter must be arranged according to the history of culture. The ungraded school can develop the geometric ornament a little better than conventionalized plant forms. Drawing of solids will prove to be impossible and may be replaced by the coloring of printed drawings showing perspective. In singing the teacher will find it best to use juvenile songs with epic contents; in the upper grades songs with epic and lyric contents. Hymns are to be taught in every grade. In arithmetic the number cycles from one to ten, from ten to one hundred, and from one hundred to one thousand should be treated with much thoroughness in the four fundamental rules, both with denominate and undenominate numbers, while for quantities beyond one thousand numeration and notation is all that is necessary. In arithmetic every rule learned should be applied to circumstances from daily life. It is not so much skill in handling large numbers as it is skill in the manipulation of small numbers and fractions which should be aimed at. Penmanship needs to be practiced only in the lower sections; while in sections 1 and 2 the German script is practiced, the Latin script is added in the third section. Though the pupils are to some extent prepared for geometry during the lessons in drawing and mensuration, it is not taken up as a separate study until the seventh year of school, and is restricted to the simplest geometric bodies.

(d) The arrangement of the matter of study is determined upon in Ziller's plan according to the idea of concentration. Since this idea is excellently adapted to act as a counterweight in ungraded schools to the unavoidable loss of time and strength, it may be applied with benefit for pupil and teacher. This application may take three forms, which may be mentioned briefly. First, in the lower sections certain branches are grouped together; for instance, knowledge of nature and home is connected with the most important branch of language studies, the so-called object lessons; likewise with arithmetic. Again, the different branches of nature study should consciously be united; for instance, it should not be said that zoology, botany, mineralogy, and physiology are taught, but the science of nature. In language it should not be

called literature, composition, grammar, and spelling, but it should at all times be called language. Instruction in religion will not suffer a division into biblical history, catechism, biblical quotations, hymns, and Bible reading. In this, as in all other branches, unity must be observed. Third, related branches should be connected and grouped around instruction of religion as the central, ruling branch of the whole course.

While the first two points may easily be observed in the ungraded school, the last one may cause some difficulty, owing to the fact that there are not as many sections as there are steps in the course. The "central, ruling position" of instruction in religion is understood to mean that from it depends the instruction in history, both with reference to the selection and arrangement of matter. Side by side with it we find various branches of nature study which in their contents form a contrast to the first group, but keep step with the others according to the capacity of the pupils and their command of language. These three branches—religion, history, and nature study—in their relation to each other represent the religious, ethical, and material side of education. Subordinate to these are geography and language, and all other studies.

If the ungraded school could treat in a separate section each group of matter in the branches that are intended to ennoble the heart, it would not be difficult to correlate history, geography, and nature studies with all the remaining branches. After the second year of school such a combination is impossible. Having two yearly courses combined in one section, it can not at the same time treat two groups of branches satisfactorily; for instance, Robinson Crusoe and the Patriarchs, or the Judges and the Kings, or the life of Jesus and the history of the Apostles. Moreover, the order of the groups can not be changed; the history of the Patriarchs should not precede the story of Robinson Crusoe. Neither can the amount of matter be restricted so as to give the work of one year to a two years' course. This would cause an unnecessary and tiresome repetition for the older children. If promotion were to take place every other year, instead of every year, it would presuppose admission to school every other year. All these difficulties prevent the adoption of the original plan of Ziller. Nothing is left but to treat both groups simultaneously, or rather alternately, changing semi-annually.

This holds good not only for the matter to be gone over in the study of religion, but also in other branches, notably in history, geography, etc. Though the difficulties are great, the idea of concentration need not necessarily be abandoned, though some branches need more of a genetic than a concentrated treatment. (The author enters into very minute details, which may be omitted, owing to the fact that Ziller's plan is by no means heartily approved in Germany, nor extensively followed. The author is evidently a pronounced adherent of Herbart's

and Ziller's pedagogy, which has not been generally accepted. The author is a very well known and successful rural school-teacher, and it is quite obvious that his plan in all its various minute details is the result of experience. But the conditions in the rural schools in this country are so different that his details, so far as they refer to methods of instruction, can not be applied easily.)

(e) The following sketch of a course of study may indicate how the matter of instruction may be distributed over four sections, representing eight school years:

#### FIRST SECTION.—FIRST SCHOOL YEAR.

*Ethical and religious matters.*—Six biblical stories from the life of Jesus; eight to ten of Grimm's Fairy Stories.

*Object lessons* (combined with next higher section).—Objects from the horizon of the children, and others illustrating ethical and religious matter. Lessons to be enlivened by memorized verses.

*Language.*—German script and print, excluding words with accumulations of consonants. Normal words chosen from matters treated in the foregoing.

*Number work.*—The four fundamental rules within the number cycle of 1 to 10.

*Drawing.*—Sketches of objects illustrating object lessons and lessons in ethical and religious matters.

*Singing* (combined with the next section).—A few simple children's songs and a few hymns.

#### SECOND SECTION.—SECOND AND THIRD SCHOOL YEARS.

*Ethical and religious matters.*—Six to 8 stories from the life of Jesus; 16 chapters of Robinson Crusoe; 12 to 14 stories of the time of the Patriarchs; in connection with the latter related matters from the catechism and a number of biblical quotations and verses.

*Object lessons* (combined with section 1).—Discussion of natural objects and phenomena relating to Ziller's step of hunting and herding. Geographical treatment of the environs and widening of the horizon.

*Language.*—Small prose pieces and poems of ethical contents. Special exercises in the skill of reading; accumulation of consonants mastered, sounding, spelling, Latin script; copies of writing from dictation, and similar exercises. The simplest facts of etymology and syntax of simple sentences.

*Drawing.*—Free-hand drawing, aided by stichographic devices.

*Penmanship.*—The small letters and capitals of German script.

*Arithmetic.*—The cycle of numbers from 1 to 100; operations in the fundamental rules with denominate and undenominate numbers.

*Singing* (combined with section 1).—Juvenile songs and a few easy hymns.

#### THIRD SECTION.—FOURTH AND FIFTH YEARS.

*Ethical and religious matters.*—The four gospels; 12 stories from the time of the judges; 16 from the time of the Kings. In connection with these matters related portions of the catechism. Psalms and hymns to be memorized. Some episodes of the Nibelungensaga; 12 to 16 stories from the time of the German Kings up to the time of the Reformation.

*Nature studies.*—Twenty to 24 subjects from Ziller's step of agriculture and horticulture; some subjects taken from the woods, and reflections upon the weather and change of seasons.

*Geography.*—The home province or state, followed by a description of Germany; map reading and map drawing.

*Language*.—Fifteen or 16 poems and prose pieces to be carefully treated and 10 to 12 compositions to be made annually. The necessary rules of grammar and orthography, including syntax of the compound sentence.

*Number work*.—The fundamental rules within the cycle of 1 to 1,000, with denominate and undenate numbers. During the latter part of the year notation and numeration of numbers beyond 1,000.

*Drawing*.—Free-hand, with the aid of given dots.

*Penmanship*.—Small and capital letters of Latin script.

*Singing* (combined with section 4).

#### FOURTH SECTION.—SIXTH, SEVENTH, AND EIGHTH YEARS.

*Ethical and religious matters*.—(a) Religion. During the first term, 20 to 24 stories from the life of Jesus; reading of the New Testament, especially the gospels; catechism in connection with this. Hymns for Advent, Christmas, and Passion Week; between Christmas and Easter, 12 stories from the times of the apostles; catechism and Bible quotations; appropriate hymns. For opening exercises and on other occasions some of the epistles may be read. At all times religious instruction should consider the church festivals. (b) History. During the first term 12 stories from German history, from Luther to the French revolution. After Christmas, 8 stories from modern history, the Napoleonic wars.

*Nature studies*.—Twelve subjects from Ziller's step of trades; 8 to 10 subjects from the industrial step. In connection with this, something from physics and chemistry interesting and important for rural communities. Six to 8 subjects of physiology, and frequent reviews and references to matters gone over before.

*Geography*.—Twelve topics from the geography of Germany and other European countries; 8 topics from other continents; 4 to 6 topics concerning astronomical geography.

*Language*.—Twenty poems and prose pieces; 12 to 15 compositions annually; the simplest rules of style; grammar, including syntax of the complex sentence. Rules for orthography.

*Arithmetic*.—Conclusion of fractions, decimals and common; percentage and some business rules.

*Geometry*.—Cubes, rhomboids, pyramids, cylinders, cones, and spheres. Planes, angles, and lines are only considered in connection with solids.

*Drawing*.—Free-hand drawing without guiding lines or dots. Geometric ornaments and the beginning of conventionalizing forms.

*Singing* (combined with section 3).—Twenty-five to 30 songs and 30 hymns within the three years' course; notation and reading of music; exercises in intervals.

*Gymnastics*.—Gymnastics can be carried on with the whole school, three sections looking on while one exercises; or games may be conducted with the lower classes, while the upper use the apparatus.

(7) *The methods of instruction* are the same for ungraded as they are for graded schools. They must be based on pedagogical principles derived from psychological imperatives as they have been formulated in systematic connection in Ziller's theory of formative steps. Only a few remarks need to be made because Ziller's theory is not the subject of discussion.

Time is wanting in the ungraded school for direct instruction from the teacher, moreover, that instruction is divided into half hours and quarters. The former fact obliges the teacher to treat only the most important matters according to the five steps; less important ones can be worked up only on the first two steps. Even with subjects demanding great care and much time, certain restrictions are absolutely unavoidable.

able. The whole organization of the school admits of no waste of time; at no period during the course may the teacher retard his progress. He must always have such ends in view which the pupil's concepts can readily reach and securely comprehend. If preceding matters have been thoroughly understood and frequently practiced, the first step, that of preparation, need not claim much time. The presentation of new matter is restricted by the time available. The same is true with the third step, and the explanations it requires. The fourth step, association, will require only a few examples for comparison. The fifth step may be represented by one sentence which crystalizes in compact form what has been learned. This abbreviation of the mode of procedure is unavoidable. The exercises following should under no circumstances be too much shortened. It is very desirable that they should have reference to the material used to make the instruction objective as well as to the thought material.

The division of personal instruction on the part of the teacher into small periods of time makes it necessary to crowd the formative steps into each hour of the day. It would be sheer waste of time to begin with aim and analysis in one hour and to continue with synthesis in another, for during the time between the two lessons the awakened concepts will vanish. The preparation must occur in the same hour in which the presentation of new matter occurs, and possibly also the total result of the oral instruction should be crowded into that lesson. During another hour the presentation may be repeated and explanations added. Neither should association be separated from application. According to the importance and extent of the methodical unit several hours may be needed to do it justice. In a minimum of three hours, that is to say lessons, the following distribution may take place: First hour, aim, preparation, and presentation; second hour, explanation and combination; third hour, repetition, association, and application. In a maximum of eight hours the steps may be distributed as follows: First hour, aim, preparation, and presentation, part 1; second hour, review, presentation of part 1, with amplification; third hour, part 2, amplification and review; fourth hour, part 3; fifth hour, part 4; sixth hour, systematic review, combination with previously established thought centers, and development of the system, or crystallization of the result; seventh hour, arranging the new results among previously acquired matter; eighth hour, application with thorough review of a whole series of results terminating in the one just acquired.

Now, to carry out the system of formative steps successfully, it is necessary, also, to take into consideration the home occupations of the pupils. Thus the aim may be touched upon during the very first hour so as to cause pupils to think ahead. During the time of silent occupation at their desks the pupils may gather material and note it down. Material for association and application may be found without the aid of the teacher, and all this work may be either in writing or oral. There are

various ways of aiding the method if the pupils are systematically trained in self-active work. No other school will aid self-activity as the ungraded school will, for the pupil, when he comes face to face with a difficulty, must not go to the teacher for help, because at that time the teacher is busy with another class and can not give him an audience. Note the difference between this and the graded school, where the teacher has only pupils of one grade. The teacher's aid is at all times at hand and readily given.

(8) *Time-table*.—In arranging the weekly plan of lessons—that is, a time-table—the question of greatest importance is, How many hours of work may judiciously be expected of the teacher?

(a) Overburdening of the teacher is to be avoided. In the ungraded school he has not only, like other teachers, to study his professional science, pedagogy, and supplementary sciences, but he is also obliged to prepare himself carefully for his daily lessons, and must furthermore perform a number of duties which are unknown to teachers of graded schools. He must prepare question books for his pupil-teachers, instruct these young assistants orally, plan for silent occupations of several classes, and do other things. To this comes the very exhaustive work in the schoolroom, where almost the only rest for his lungs are the minutes which the pupils require to answer his questions. If under such conditions the teacher's time would be extended to more than thirty hours' actual school work, it would be the ruin of his health, and the freshness for his mind would be irreparably injured. On the other hand, there is the consideration of keeping the number of hours high enough to enable him to treat every branch of study properly. Taking thirty as the maximum of weekly school hours, both sides of the question seem to be well considered.

(b) In dividing the time so as to represent the various branches the following general principles should be considered: First, branches should be given more time than others if they belong to the group designed to awaken ethical consciousness; second, that the special nature of each branch should be considered with reference to its furtherance by exterior conditions. Thus, for instance, the historic branches need more time than the nature studies, because the presentation of the events need more time than the showing and handling of objects. Naturally, subjects that depend upon actual sense perception can be taught more quickly than branches such as religion, history, literature, and a few others, in which the spoken or printed word is almost the exclusive carrier of thought. Again, a well-articulated branch needs more time than one of simpler construction. Branches rich with apperceiving concepts may be given less time than those in which the concepts have to be generated first. Finally, it should be considered whether a branch offers more or less opportunity for silent occupations. In the latter case more, in the former less time is needed. For instruction in religion all these considerations claim a large number of lessons.

We have therefore assigned it six lessons a week, of which one hour may be taken for the opening or devotional exercises. In some villages these are given on Sundays in what we here in America call Sunday schools. If this is the case, three to four hours can be assigned to the upper and middle grades, while two to three lessons are given to the lowest grade. The study of history needs rarely more than two hours a week, because it is taught only to the upper grades. Moreover, the articulation of that subject is less minute than in religion. Nature study needs, owing to its importance, a large number of hours because it has numerous subtopics. But since in rural schools the whole cycle of life of the children offers advantages for that kind of study, three hours per week of systematic study must suffice. Geography may have two hours a week. To the five hours given to nature study and geography must be added two hours of object lessons given to the lower grades. These lessons are preparatory to both nature study and geography. In all the branches mentioned so far two sharply defined grades or sections are understood to exist, except for geometry. Five lessons are given to language; that is, the study of the mother tongue. Less than that will not suffice; first, because it is supplementary to all the branches of the course; second, because systematic instruction in language will wipe out dialectic irregularities in the children's speech. More than five hours for language will not be needed, because all instruction is language instruction, and because this branch offers many opportunities for silent occupations at the desk. Language instruction, properly so called, serves only indirectly the highest aim of education (see what the author says under "Aims of instruction" in the beginning of this article), and may be combined in many ways; for instance, grammar and spelling, grammar and composition, spelling and copying, etc. For drawing and penmanship the former relation has been reversed. In arithmetic the customary assignment of four hours, as well as the assignment of two hours for singing and gymnastics, is retained. Gymnastics is dropped in the winter and in place of it geometry is inserted.

From the foregoing we obtain the following distribution:

|  |  | Hours. |
|--|--|--------|
| Upper and middle grades, sections 3 and 4:       |  |        |
| Religion.....                                    |  | 3-4    |
| History.....                                     |  | 2      |
| Nature study.....                                |  | 3      |
| Geography.....                                   |  | 2      |
| Lower grades, sections 1 and 2:                  |  |        |
| Religion and history.....                        |  | 2-3    |
| Nature study and geography (object lessons)..... |  | 2      |
| All three grades, sections 1 to 4:               |  |        |
| Language.....                                    |  | 5      |
| Arithmetic.....                                  |  | 4      |
| Drawing.....                                     |  | 2      |
| Singing.....                                     |  | 2      |
| Penmanship.....                                  |  | 1      |
| Geometry (in section 4).....                     |  | 1      |

This makes a total of thirty hours per week.

In summer the hours may be of necessity abbreviated, since the school session is often disturbed by the needs of the parents and frequently restricted to the forenoon. In that case nature study has to give up one lesson, language also one hour, and drawing one hour. Geometry is combined with arithmetic. An addition is made by inserting two hours for gymnastics, so that the entire number of weekly hours is twenty-eight. The free afternoons may be used frequently for little excursions into the woods, where oral instruction is given incidentally and in a pleasant manner.

(c) With regard to the succession of lessons, both psychological and physiological rules should be heeded, but local considerations cause many deviations from rules prescribed by psychologic-pedagogic demands. As far as the effect of concentration upon the daily plan of lessons is concerned, the lessons should follow according to the degree of relationship existing between the branches, so that the unity of the whole plan is not violated. A lesson in religion, for instance, might be followed by one in history; this may be followed by language, then might follow penmanship and singing. But arithmetic or geometry should not follow upon a lesson in religion. The combination of heterogeneous branches disturbs the mental balance or composure of the pupils and the teacher; moreover, it spoils the continuity of instruction.

Physiological considerations demand that the branches claiming the greatest outlay in brain force be treated in the forenoon, when the mind is fresh. Branches which aim at mechanical skill can safely be given time in the afternoon. However, in some schools the requisite light may be wanting in a latitude in which twilight begins before 4 o'clock. Again, the "confirmation lessons" conducted by the parish pastor either in the church or the parsonage cause much loss of time owing to the long walk for children who have to go to a neighboring village to reach the church.

It would be utterly futile to prescribe a time-table adapted for every school. Local circumstances determine the table everywhere, and occasional changes of the time table are not at all objectionable since they may serve to prevent dead routine.

Besides the regular time-table designed to aid both teachers and pupils, the teacher should prepare for himself another plan, a so-called "plan of work," in which he notes down what each section in each lesson does, be it conducted by the teacher himself or by a pupil-teacher, or whether it consists of written work and silent occupations. Such a plan of work can not be made for the whole year, not even for a term, but it is wise to make it from week to week.

(9) *Equipment*.—In building and equipping ungraded schools the wealth or poverty of the community is in most cases regarded above considerations arising from the demands of pedagogy and hygiene. At this point we have nothing to do with local considerations and may

confine ourselves to the latter point, which is not at all incompatible with economic equipment.

(a) The schoolhouse must have a healthy location far from disturbing noise, such as paved streets would cause. It must not be surrounded closely by trees which would shade the schoolroom windows, though the spacious playgrounds should be studded with trees. Since in central Europe in rural schools the dwelling of the teacher is usually under the same roof with the schoolroom, it is well to have the schoolroom and teacher's study or office connected by a glass door. The schoolroom should be bright and spacious, more wide than long, so that the whole school is divided by a broad aisle into two sections, each one of which contains two classes or grades. If the pupils' seats are as they should be, adjustable to the height of the pupils, it will materially aid in organizing and managing the school. It is not advisable to have the teacher's desk perched on a high platform, but it should be on a level with the class, and might be movable, so that the teacher, if necessity arises, can move himself as the center of attention, and yet have his aids and paraphernalia within reach. It is also advisable to place a screen in the aisle between the class which the teacher hears himself and the others busy in their seats. One or two more screens used in the corners may serve to deaden the sound caused by the work of pupil-teachers. The location of the windows is very important. If they are high and placed so that the light falls upon the left and the rear of the children, they will serve all the different classes and leave wall space enough for blackboards and charts.

(b) The apparatus and other devices must be ample, yet of such a nature that they will claim little space. When procuring them it must be considered that they are to serve an entire school system, hence must embrace the objects required by all the eight grades of the school. Much more space should be utilized for blackboards. One space can be provided for painted lines for penmanship, and for writing music. If there is an anteroom which can be utilized by pupil-teachers it should have a blackboard also. Spaces between the windows and doors may be used for matters which it is desirable to exhibit for a longer time than a day or a lesson. Charts and maps should be arranged like window curtains, so that they can be rolled up, and thus saved from the destructive effect of dust. There must be picture charts for illustrating history and geography. The school should also have a cabinet with objects for nature study and object lessons, which cabinet can be replenished with new objects procured during the brief excursions. An abacus, reading charts, and the like should never be wanting.

The number of text-books should be very limited. All that seems to be necessary in this line is a Bible—that is to say, a school Bible, not the unabridged edition—a catechism, which is usually bound together with the school Bible; a hymn book; a reader, which may at the same

time be used as a source of information for historic, geographic, and other instruction; a book of examples for arithmetic, and a small book of songs. It is absolutely necessary, however, to have the readers graded in at least four books. Where it is admissible, exercise books should be used for the branches that require the retention of numerous facts. It is to be regretted that the needs of the ungraded school in regard to text-books are rarely considered by authors, most text-books being compiled for the special needs of the graded school; hence much more preparation is required of the rural teacher than of the city teacher.

(10) *The teacher's position.*—The external conditions of the teacher in ungraded schools leave much to be desired.

(a) The salary of rural teachers in Prussia and in Bavaria, as well as in other German States, rarely reaches the sum of 1,000 marks, equal to \$250, and in very exceptional cases does it exceed 1,000 marks. This sum appears very small, but it should not be forgotten that the teacher does not have to pay rent; he lives in the schoolhouse, and frequently has the use of from 5 to 40 acres of land. In most cases the teacher is obliged to work this school land and raise provisions. Where the teacher has a large family this item is of no small account. Sometimes he is obliged to give private lessons and do other work to increase his salary. Positions that offer very low salaries are usually given to young normal-school graduates, who are always well enough versed in economic living to make both ends meet. These conditions make ethical and scientific instruction very difficult. Not until the teacher is free from material care can his work in school become beneficial to his pupils and to the entire community. So long as he is an object of pity and commiseration he will not exercise that influence which the teacher of the growing generation must command to be useful to the children and their parents.

(b) Viewed from the standpoint of pedagogical science, the supervision of ungraded schools leaves much to be desired. It is frequently performed by men who have a theoretic and philosophic professional education, but in the rarest cases a pedagogical preparation. This want is the natural consequence of the absence of pedagogical seminaries in universities. Moreover, the supervisory officers learn to know the ungraded school only from occasional visits; and they are usually performing the duties of supervisors in addition to other regular duties, such as the duties of pastors. Though it is required of such men to spend six weeks in a normal school after they have completed their university course, this smattering of professional education is insufficient to do full justice to the schools under their charge, schools which, by their numerical importance, are one of the most essential sources of culture for the majority of the people. Again, no one can serve two masters, the church and the school; church services and school services should be separated. Teachers who have gone through a regular course

of normal training perceive more accurately the insufficiency of the present system of supervision. Young graduates being placed in charge of rural schools, though they may be theoretically well supplied with knowledge, need professional advice, and under the present circumstances can not get it. Goltseh, in his book on Courses of Study for Rural Schools, says:

It is hard to place young teachers face to face with a problem which can be solved only by unusually talented persons, a problem of which neither local nor provincial school inspectors, nor the highest educational authority in the State, can tell in what way he may solve it.

In order to obviate this difficulty the establishment of pedagogical university seminaries, with practice schools attached, would be necessary. In these institutions the professors of normal schools and the supervisors of city and rural schools might be professionally prepared. The right to attend them should be granted to teachers of elementary schools if they can prove their capacity for academic study, and if the result of their normal-school training, as well as successful study of at least two foreign languages, would justify admission. Another condition of admission might be a number of years of successful experience in a public school. This last condition should also be required of ministers and philologists, if they apply for supervisors' offices. Not until such conditions are required can it be hoped that persons intrusted with the supervision of schools will become authorities for the teachers of the rural schools. Not until they have gained experience in teaching will they be able to advise the teachers under their charge; and it must be insisted upon that their office should not be a supplementary office, but that they give all their time and power to supervision of schools. If the possibility is open to rural teachers to be promoted to the office of supervisor, it will increase their aspirations and effectually promote the rural schools in general.

(c) With the question of supervision is intimately connected the question of rank. There have been contentions between the rural teachers and principals of graded schools. It is claimed that the teacher of a rural school conducts an entire system, i. e., that he has pupils of all grades, but that his field of activity is narrowed down by the fact that they are all in one room. However, they claim the rank of a principal—a claim that has not been recognized by the authorities.

(d) The position of the rural teacher within the community seems to call for a reform. It has been stated before that the teachers of the ungraded schools come into more frequent and intimate contact with the families of their pupils than the teachers of other schools. They can therefore exert an influence upon the home, resulting in interesting the parents in the work of the school, so that they assist his work, and indirectly the teacher can thus influence home education. He can do so directly by public lectures, "evening gatherings for parents," and

similar entertainments. Not often have teachers time for this kind of public work, because most teachers of ungraded schools are called upon to perform all kinds of nonpedagogical work; they are frequently called upon to do sexton's work and act as organist during church services. Very frequently they are secretaries of the common council, and for all these extra duties they receive little or no pay. If the teacher's time and strength could be concentrated upon his educational duties, it would be a great advantage to him and to the school under his charge; in that case he could do much to enlighten the community on educational questions and become a live factor in the education of the entire community.

(11) *Statistics.*—How important and far-reaching the promotion of the entire education of the people would be, if the system of ungraded schools were fostered in the spirit indicated in the foregoing article, may be seen from the statistics of this kind of schools. The following numbers are taken from the official statistics published by the Government of Prussia in the year 1891. In that year the Kingdom had 16,600 ungraded schools, in which 962,079 children were taught by 15,548 teachers. Of these were 51 ambulatory schools without teachers, and 3 with 2 teachers. This explains the difference between the number of schools and that of teachers. Since the total number of all schools in the Kingdom in that year was 37,742, with 82,746 classes and 71,731 teachers, it is plain that 47 per cent of all the schools were ungraded in which 22 per cent of the total number of teachers taught. Most of these schools were overcrowded. Their normal attendance, placed officially at less than 80 pupils, was found in 13,639 schools with 682,260 children. Of these there were 2,135 schools with fewer than 30 school children. The number of schools with abnormal attendance was 2,906 with 279,819 pupils, and of these 2,079 had between 81 and 100 pupils each, 796 had between 101 and 150, and 31 had even more than 150 pupils. During the last ten years numerous ungraded schools, owing to their overcrowded condition, were changed into schools of two grades, of which each had a half-day's instruction. Though the number of purely ungraded schools was thereby decreased, the number of teachers was not, accordingly, increased. In the year 1882 Prussia had 20,082 ungraded schools with 1,336,404 children with 20,016 teachers. From this it is seen that 61 per cent of the schools were ungraded. No less than 14,453 schools with 744,688 pupils had normal, 5,629 with 595,716 pupils had abnormal attendance; that is to say, more than the required number, fixed at 80. Of the latter, 2,975 had between 81 and 100 children, 796 had between 101 and 150, and 329 had more than 150 children. On the other hand, in 1882 there were only 2,989 schools of two grades with 1 teacher attended by 337,801 children, against 5,878 of such schools attended by 568,235 children in 1891. The change of ungraded schools into schools of two grades with 1 teacher has of course decreased the overcrowding, but this is of questionable benefit. A teacher may find it easier to maintain discipline in two grades than

if the pupils were altogether in one room, but it decreases the time devoted to their instruction to one-half, hence the educational influence of the teacher is considerably lessened by this reduction. In the year 1882 a teacher of a half-day school had, on an average, 113 pupils; in 1891 he still had 96. This arrangement of half-day schools increases the duties of the teacher enormously. In the Kingdom of Saxony, in the principality of Anhalt, and in a few other German States, the half-day school is preferred generally, while purely ungraded schools are found in the Kingdoms of Bavaria and Württemberg, and in the grand duchies of Hesse, Oldenburg, Weimar, Gotha, and Mecklenburg. In Austria the division into half-day schools is performed as soon as the number of pupils rises above 50.

*Literature.*—Until recently the number of books on rural schools was very meager. Zeller's *Lehren der Erfahrung* (Basel, 1827) is very much out of date, also a book entitled *Einrichtungs- und Lehrplan für Dorfschulen* (Berlin, 1752). The latter work gave preference to half-day schools. The noted educators and authors, Diesterweg, Dittes, and Kehr, did not mention the village school at all, or only with passing notice. In recent years the ungraded school has found very much attention in educational literature. The best of the books published are: (1) Heinemann, *Einklassige Volksschule*, Gera, Hofmann, 1827. (2) Pfeifer, *Theorie und Praxis der einklassigen Volksschule*, Gotha, Thienemann, 2 vols., 1887. Both Heinemann and Pfeifer treat the subject with reference to the idea of concentration. (3) Florin, *Methodik der Gesamtschule*, Zürich, Schulthess. He treats organization, instruction, and the utilization of pupil-teachers with much care. (4) *Lehrplan für einfache Volksschulen*, an essay in the twenty-third Yearbook of the Society for Scientific Pedagogy, is worthy of mention.

#### V.—GERMAN OPINIONS ON THE BELL-LANCASTER METHOD OF MUTUAL INSTRUCTION.

##### (1) Schmidt, History of Pedagogy:

The essential features of the Bell-Lancaster or Monitorial Method consists in making the advanced pupils teachers of the beginners and other pupils of lower grades. These "pupil-teachers" teach or transmit only elementary knowledge after rigidly and minutely prescribed schemes, while the teacher, like an overseer in a factory, teaches but little, and chiefly conducts and supervises the action of his monitors. This mode of conducting schools is considered the surest means of gradually exercising the powers of thinking by applying knowledge previously acquired and of fixing facts in the mind by communicating them to others. It fits instruction to the needs of the individual children better by exactly grading them in classes according to their mental advancement. It sharply defines the matter of instruction, arranges it carefully, and divides it into convenient steps, thus educating the powers of the juvenile mind in every direction, for the pupil does not only receive or acquire knowledge, but has constant opportunities for applying new cognitions and newly learned facts for the benefit of others, while in a regular school the children might sit still for whole hours, only occupied with listening, thinking, and answering questions. The real teacher of a Bell-Lancaster school has many chances of observ-

ing his pupils in different positions, thus learning their dispositions, special talents, and aptitudes. Finally, the monitorial system arouses the love of fellow-beings; it generates the consciousness that we are all dependent upon one another. Hence it creates a common feeling in the pupils and pleasure in reciprocal aid and mutual work for the benefit of all. The pupil feels that he does not exist for his own self, but for others and the whole community of which he is an integral part. In opposition to Bell-Lancaster's method, it is claimed (chiefly by Diesterweg) that the subdued voice (necessary in this mode of teaching where several classes are reciting in one room) in reading does not develop the organs of speech, the accent disappears, and thoughtless reading is promoted. Arithmetic becomes purely mechanical, because the young helper can not point out the reason of any process. Penmanship is neglected, since that art depends less upon constant practice than upon taste for symmetry and the beautiful, which taste can only be awakened by sensible and well-directed instruction in correct seeing and imitating. The whole organization of the school tempts the teacher to fall into mechanism. It is true a greater number of children may be set into external action by means of the monitorial system, but not into internal action, yet the latter alone promotes the true aim of the school.

(2) Zschokke<sup>1</sup> (in 1822) said in his book, *Elementary Schools*, on mutual instruction—

Bell's invention must be considered a benefit to the human race, and, in spite of stale talk of ignorant scribblers, mutual instruction will spread more and more in all the nations of the world. Its inner value, proved by experience, will speak for it. It will give to the human race a new form by ennobling the lowest, depraved, and most numerous class of people. This easy, sure, and cheap means of common education of the people will, no doubt, be in general use in all the five continents within a few decades.

The Bell-Lancaster system or method spread with remarkable rapidity. All over England Lancastrian schools sprang up. In 1811 more than 30,000 children were taught in that way in England. In 1814 a society for Great Britain and foreign countries was formed for the establishment of Lancastrian schools. As early as 1806 the method found its way into the United States; in 1810, into Calcutta; in 1813, into Canada and the Cape Colony; in 1814, into Sierra Leone and Sydney, as well as in all European countries, so that in 1813 more than 100,000 children were taught in that way.

(3) Lindner, in his *Encyclopedian Manual*, says:

Indeed, it must be admitted that the idea of mutual instruction was an excellent one, especially for ungraded schools, where the teacher has several grades, that is, pupils of varying age and accomplishments. However, a system of schools based upon this method can be only a makeshift which violates the principle that an "unfinished" (undeveloped) mind can not well instruct others still less developed. Education being both a science and an art, can not well be pursued by young persons who are not even apprentices in the business. If, however, we consider that the ungraded (rural) school is still very numerous (in Austria 53 per cent of all elementary schools are "one-class schools") the monitorial system is not without its merits.

(4) Sanders's *Lexicon of Pedagogy*:

The Bell-Lancaster method was very much overrated in the beginning. It spread over England and a large part of Europe. It was welcomed with great hopes by

---

<sup>1</sup> Noted Swiss educator, author, and statesman, 1771-1847.

friends of popular education in states and countries in which elementary education for the people was still in its infancy, as, for instance, in Greece, Spain, and Portugal. Through an enthusiastic report of Colonel von Abramson, in 1819, the Danish King Frederick VI was persuaded to promote Bell and Lancaster's system, and in consequence it found general favor in Denmark, also in the German provinces Schleswig-Holstein (at that time parts of the Kingdom of Denmark and of the German federation). The normal school at Eekernförde was the central seat of the agitation for this system, but here it was materially modified by adapting it to the principles of Pestalozzi. In other German states the system found only occasional support. Diesterweg opposed it with his inimitable critical weapons. Time and experience have brought out the faults and merits of the system. As a substitute for a real school with a true teacher it can never serve. The teacher's personal influence is a "*conditio sine qua non*" for truly educative and formative instruction, even in technical branches, such as writing, drawing, singing, etc. Modern pedagogy has retained the monitorial feature by allowing the oldest and best gifted pupils to teach the lowest grade under the supervision of the teacher, who at the close of the lessons or the day's work revises and corrects his assistant's work. In Prussia this is done in many overcrowded schools, and it is from these monitors, or pupil teachers, that the normal school candidates are chiefly selected. The older pupils who are intrusted with teaching derive much profit from this service, provided always that the teacher keep his school well in hand and supervise their work, so that the individuality of every pupil may be studied by him. In other words, the system works well if the teacher remains the teacher and does not sink to the level of an overseer of mechanical contrivances. In that case the older pupils who act as his assistants gain much knowledge and retain what they are taught.

#### (5) Zerrenner says in his Book of Methods:

Mutual or monitorial instruction is that method, according to which the teacher, if he have pupils varying much in age, classifies his pupils according to their capacity and teaches these pupils together, thus making a number of divisions, one of which he teaches at a time, while the others review and practice what they have been taught, and do it under supervision and with the aid of pupils of an advanced grade. This mode of procedure has been applied in thousands of schools for several years, and has proved most beneficial. Every teacher who has a number of pupils varying much in age and accomplishments should adopt it.

The essential in mutual instruction is:

(a) That the teacher divide all the pupils of his room into two (or three) divisions to facilitate instruction. In primary grades two are sufficient; in schools of more varied accomplishments three divisions seem advisable.

(b) That the teacher grade the matter of instruction in reading, history, and arithmetic in a definite number of steps. In reading, for instance, in 15; in writing, in 10; in arithmetic, in 14 steps, called steps of a course.

(c) That the teacher carefully examine and grade his pupils according to the steps of his course.

(d) That he himself teach in every branch of the course and guide the progress of his pupils from step to step.

(e) That he occupy those divisions not under his immediate care by giving them exercises in review or application of the matter learned.

(f) That in these exercises, also, he divide the pupils according to the steps of the course.

(g) That the supervision and guidance in this work be intrusted in each branch to pupils at least three steps ahead of the division.

(h) That the number of pupils intrusted to such subushers or pupil teachers be not too large (3 to 4 in reading, 6 to 8 in writing, 4 to 6 in arithmetic).

(i) That, as far as practicable, all pupils of the teachers' room be called upon in

the regular course to act as subushers, since the work is very important for their own development.

(j) That the teacher, by keeping a list, make it possible to regulate the activity of his pupil teachers and steadily keep his eye on a good classification of his school. Day or minute books are a necessity.

---

## VI.—COURSES OF STUDY FOR PUBLIC ELEMENTARY SCHOOLS IN CENTRAL EUROPE.

### INTRODUCTION.

The National Educational Association has recognized the great importance of the question as to what and how much to teach in the public schools by appointing in subsequent annual meetings committees of inquiry into the courses of study (*a*) for secondary, (*b*) for city elementary, and (*c*) for rural schools. Never in the history of this educational association has a question been treated with more dignity, profound research, and satisfactory results. The reports of the two first-mentioned committees have been published and widely circulated; the third is still in preparation at this writing. The particular problem of finding the relative value of studies has of late agitated the minds of German teachers as well, as is seen by the results of comparison of the courses prescribed for various cities, a copy of which is here offered in English. It is noteworthy that the plans offered in the following sketches show the relative value of the branches expressed in the number of lessons assigned to them. This of course does not consider the personal element, the teacher, but presupposes that the schools are provided with professionally well-prepared teachers who have had a normal school training of from four to six years. This is a feature of the question with which we can not reckon in this country as yet. Although the normal schools here increase in number and attendance from year to year, the profession of teaching is not as yet well defined in the United States, hence much more weight is attached to the externals of public education—the schoolhouses, equipments, devices, and courses of study. This fact will make the following showing from sixteen cities in Germany, Austria, and Switzerland very interesting. They were published in the *Paedagogische Zeitung* of Berlin, attracted much attention, and in a few cases resulted in an adjustment of differences, as indicated in footnotes.

### I. SKETCH OF VARIOUS COURSES IN OPERATION.

Want of familiarity on the part of the American reader with the conditions of German public schools, and the peculiar development they have had during nearly two hundred years of existence, do not permit a comprehensive treatment of the courses of study pursued in German people's schools. Many restrictions are thereby caused. Only essentials can be discussed, and hence it will be best to confine the discussion to typical examples of courses in use. In regard to particulars, it will

be found advisable to examine only the fully developed school organizations—that is, the graded school—because the conditions in question are there best represented, and because these schools are primarily in the position to be serviceable in the intended investigations. In less favorable conditions—that is, in schools not so well graded—the given factors always cause a diminution of work. In the following statement we shall endeavor to answer the two questions:

(1) Is the course of study in German people's schools of such a nature that the lower grades afford a proper foundation for all other educational institutions?

(2) Does the course of study in the upper grades of German people's schools include the branches generally considered necessary, and recognized by professional teachers as essential, to the education of the people?

The answer in substance to the first of these questions is found in the time-tables of the schools. Advanced education recognizes as absolutely essential a knowledge of elementary branches (reading, language, writing, arithmetic) and a good perceptive faculty. To institutions like the intermediate and secondary schools, which, without exception, begin with the elements of different studies, it is more of a drawback than an advantage to begin a number of subjects without bringing any to a definite conclusion. Where the time-table of the lower grades shows that most attention is given to elementary instruction in reading, writing, arithmetic, grammar, object lessons, and reasoning, the people's school may as a rule be accepted as an appropriate foundation for all these institutions. The chief object in presenting the following tables is to show the essential differences of German States in this regard. The tables for the first four or five years alone would be sufficient to show this, but as the significance, extension, and treatment of a number of studies in the upper grades are to be discussed later on the whole course is given at once, to economize space. It is the object also to treat the separate German States as far as can be done in their usual order.

The foundation for the order of study of Prussian people's schools is given in the general regulations of Minister Dr. Falk of the 15th of October, 1872. The general regulations prescribe for graded schools:<sup>1</sup>

|  | Lower grade. | Middle grade. | Upper grade. |
|--|--------------|---------------|--------------|
| Religion .....                             | 4            | 4             | 4            |
| Language .....                             | 11           | 8             | 8            |
| Arithmetic .....                           | 4            | 4             | 4            |
| Geometry .....                             |              |               | 2            |
| History, geography, and nature study ..... |              | 6             | 6-8          |
| Singing .....                              | 1            | 2             | 2            |
| Gymnastics .....                           | 2 [0]        | 2 [0]         | 2 [0]        |
| Drawing .....                              |              | 2             | 2            |
| Female handiwork .....                     | [2]          | [2]           | [2]          |
| Total .....                                | 22           | 28            | 30-32        |

<sup>1</sup> Where there is but one number in a column, the statement applies to both sexes. If the number refers only to boys, a naught is added in brackets. The numbers referring to girls only are inclosed in brackets.

This order has had later corrections by the same authority. By commission of Minister von Gossler (25th of July, 1884) the provincial authorities were empowered to extend religious instruction by one Bible lesson; consequently, to prescribe six and five hours of weekly religious instruction in schools of one grade and several grades, respectively.

The original time-table of the general regulations has not been strictly adhered to in any part of the State. It is, moreover, decidedly obscure. Which years are to be included in each of the three grades it does not state. But as it is decided that if the school has four classes two shall constitute the middle, and with six successive classes two shall cover the ground of one grade, one must presume that in schools of four grades the upper grade begins with the seventh year; in schools of six grades with the fifth year. A wide scope is thus given the teacher to work out his own plan. In the former case, the middle grade embraces four years; in the latter, two; in the former, history, geography, and natural history must be begun in the second year (which has actually been attempted in several instances); in the latter, in the third.

Two typical examples of both extremes in the scales here considered are furnished by the time-table of the people's schools in Charlottenburg and the elementary schools in Wiesbaden.

*People's schools in Charlottenburg.*

|                        | Grades. <i>a</i> |        |       |         |       |       |         |

*a* The designation of grades in all the time-tables contained in the article is according to the North German custom (the I grade being the highest, even when the reversed designation is made use of). For uniformity's sake, writing and object lessons are always included in language lessons, natural history and science are classed as nature study, and preparatory instruction for geography (study of home and environs) included with geography. Particular features are explained in footnotes.

| Total .....              | 18      | 19 [21] | 22 [25] | 24 [27] | 28 [32] | 31 [33] | 31 [33] | 31 [32] |

*a* Each year from the first to the fourth has three hours of object lessons and home geography.

The difference is very apparent. If we compare the third and fourth years in both plans we shall see the essential difference between an elementary school and a school occupied from the very start with a wholly unnatural multiplicity of studies, and beginning nearly all the branches included in the people's school curriculum at the same age, when the average faculty of comprehension has not been sufficiently developed.

In the old Prussian provinces, particularly in those east of the Elbe River, schools of six grades predominate; they follow the "General regulations" rather closely. The people's schools in Dantzic, Posen, Breslau, Stettin, and Halle present only unimportant differences. In Dantzic, Stettin, and Halle, history, geography, and natural history are taught in the third year; in Posen and Breslau, instruction in history is deferred until the fourth year. In nearly every instance drawing is begun in the second year; until lately, in Berlin two special drawing lessons were prescribed even for the first year. The present time-table in communal schools in Berlin is as follows:

*Communal schools in Berlin. a*

|                        | Grades. |    |        |         |         |       |
|------------------------|---------|----|--------|---------|---------|-------|
|                        | VI.     | V. | IV.    | III.    | II.     | I.    |
| Religion .....         | 4       | 4  | 4      | 4       | 4       | 4     |
| Language .....         | 11      | 9  | 10 [8] | 8       | 8 [6]   | 8 [6] |
| Arithmetic .....       | 4       | 4  | 4      | 4       | 4       | 4     |
| Geometry .....         |         |    |        | 2 [0]   | 2 [0]   | 3 [0] |
| History .....          |         |    |        | 2       | 2       | 2     |
| Geography .....        |         |    | 2      | 2       | 2       | 2     |
| Nature study .....     |         |    | 2 [0]  | 2       | 2       | 3 [2] |
| Singing .....          | 1       | 1  | 2      | 2       | 2       | 2     |
| Gymnastics .....       | 2       | 2  | 2      | 2       | 2       | 2     |
| Drawing .....          |         | 2  | 2      | 2       | 2       | 2     |
| Female handiwork ..... |         |    | [4]    | [4]     | [6]     | [6]   |
| Total .....            | 22      | 22 | 28     | 30 [32] | 30 [32] | 32    |

a See also the article on "The Elementary Schools in Berlin," published in the Report of the Commissioner of Education for 1893-94, p. 295, where the courses for 1840, 1860, 1873, and 1893 are compared.

The amount of time devoted to female handiwork (formerly eight hours weekly), the early beginning of drawing, the third hour of geometry in the upper grade, and the small number of language lessons in the upper grades of female schools are characteristic of this plan. The model thereby proposed has rarely been followed outside of Berlin. The following table of the people's schools in Halle serves as a type for schools of six grades:

*City people's schools in Halle.*

|                        | Grades. |         |         |         |       |       |
|------------------------|---------|---------|---------|---------|-------|-------|
|                        | VI.     | V.      | IV.     | III.    | II.   | I.    |
| Religion .....         | 4       | 4       | 4       | 4       | 4     | 4     |
| Language .....         | 11      | 10      | 8       | 8       | 8     | 8     |
| Arithmetic .....       | 4       | 4       | 4       | 4       | 4     | 4 [3] |
| Geometry .....         |         |         |         |         | 2 [0] | 2 [0] |

| Female handiwork ..... | [2]     | [4]     | [4]     | [4]     | [4]   | [4]   |
| Total .....            | 22      | 22 [24] | 28 [32] | 28 [32] | 32    | 32    |

The time-tables for the people's schools of the new Prussian provinces resemble in general the plan of Wiesbaden more than that of the schools of six grades in the cities just mentioned. The people's schools in Kiel (8 grades) begin only geography with two hours in the third year, history and nature study with one hour in the fourth year. In Altona the three lower grades have only three hours of religion. In Osnabrück nature study begins with one hour in the third year, geography is introduced in the fourth, history in the fifth, and geometry in the sixth year.

The people's schools of Bavaria have no common order of study. That of Munich seems most characteristic. It reflects the purpose of the general primary school most clearly, and in the upper grade endeavors to satisfy the higher claims on public instruction, as far as can be possible within the limits of a seven-years compulsory attendance. For comparison the order of study in Augsburg is placed in juxtaposition. The course in Nuremberg is about a medium between the two, whilst that at Würzburg differs widely in devoting a great many hours to religious instruction.

The schools of the Kingdom of Wurtemberg are very unlike those of its neighboring state. Munich and Stuttgart in this respect present

the greatest extremes to be found in German city schools. This the following table proves without further explanation:

*People's schools in Stuttgart.*

|  | Grades. |       |       |        |        |        |        |

The following regulations apply to country schools throughout the Kingdom of Wurtemberg. With an aggregate number of twenty-six hours per week, one-third must be devoted to religion, including memorizing hymns and Bible texts. The remainder, as well as all hours over twenty-six, are devoted to other studies in the proportion of three-sevenths to language, two-sevenths to arithmetic and mensuration, and two-sevenths to history, geography, nature study, and singing. Teachers for a long time have endeavored to reduce the one-third devoted to the study of religion, but without apparent success.

In Saxony and the Thuringian States under its direct influence there exist two or three kinds of people's schools. We shall here consider only the lower people's or district schools and the burgher schools, which in many places pursue the same course as intermediate people's schools or advanced schools elsewhere. In Leipsic the advanced and district male schools follow exactly the same course; the female schools present few differences. In Dresden the deviations are greater.

*District schools in Dresden.*

| Total .....                             | 18                    | 18 [20]              | 20 [24] | 24    | 28 [30] | 28 [30] | 30    | 30    |

In the first year of burgher or advanced schools and district or elementary schools in Leipsic, the sessions number only sixteen hours per week in the first four years of elementary schools; in Zwickau they number twelve, fourteen, eighteen, twenty-two (girls twenty-three) hours, and in advanced schools twelve, sixteen, twenty-two, twenty-four (girls twenty-six) hours. The conditions prevailing in the Thuringian States resemble in essential points those of Saxony; in some States, as in Weimar, the Prussian model has been followed.

The special features of the course of study in the people's schools in Baden are officially defined. Elementary embraces sixteen, advanced instruction twenty-six to thirty hours. In the latter case, three are devoted to religion, nine to ten to language, four to five to arithmetic, two to singing, six to seven to history, geography, and nature study. Communities are allowed to establish advanced people's schools in place of or in connection with the people's schools required by law. Mannheim furnishes an instance of the first case. The city besides supports advanced people's and girls' schools, likewise designated "advanced people's schools"; in them, however, French is a compulsory study, whereas in the other people's schools foreign languages are optional.

*Advanced people's schools in Mannheim.*

The course of study in Hussia is almost identical with that of Prussia prescribed in the "General regulations," particularly in the amount of time given to religion and in the early special study of history, geography, and nature study. But a radical deviation in the Hessian regulation prescribes fewer hours for the first two years, and divides graded schools into four instead of three grades, thus paving the way for schools of eight grades.

*People's schools in Hussia.*

In Mayence the eighth and seventh grades have each three, the other grades each five hours of religion.

Schools in the middle and minor States of north Germany incline to those of Prussia. The conditions of the city schools of the two Mecklenburgs are identical with those of the provinces east of the Elbe River. Rural schools are considered only the beginnings of educational institutions. Oldenburg, the capital, has schools of eight grades; Bremen and Lübeck follow the example of the new provinces of Prussia. In Brunswick Saxon influences prevail. We select only three schools from the different States.

Both sexes are instructed together from the sixth to the third grade; in the second and first, or upper grades, they are separated.

a The school board of Hanover has prepared a course in which the following radical changes are proposed: The seventh grade should receive eighteen hours in summer and twenty in winter; the sixth grade twenty-four, the fourth grade thirty. The other grades retain the same number. Some studies suffer the following alterations: Religion is not studied in the seventh grade and is limited to two hours in the other grades; language is much further advanced; female handiwork is limited in the intermediate and omitted from the two lower grades.

The people's schools of Alsace and Lorraine differ widely. Mülhausen has schools of eight, Strassburg of six, five, and four grades. Particulars may be omitted, since they would scarcely enhance the value of this statement.

The purpose of people's schools and the arrangement of studies in Austria and in some Swiss cantons appears desirable. Furthermore, from an American point of view, their time-tables correspond better to the purpose of common schools than most German tables presented in the foregoing.

*a* Further information is given in *People's Schools and Kindergartens in Switzerland*, a report of a journey of inspection to Berne, Zurich, and Basel by order of the Diesterweg Institute in Berlin, by Ernst Ewald, city teacher (privately printed): Berlin, 1892.

The foregoing tables invite comparison in very different directions. The aim of education in the lower grades is defined by the earlier or later introduction of history, geography, and nature study, and by the latitude given to religious instruction. As the addition of new studies signifies in most cases the existence of a course in the sciences, it is of importance that the beginning and extent of these studies be for some schools presented synoptically in the introduction. This has been attempted in the following table, which, however, only includes schools for boys.<sup>1</sup>

*Beginning and extent of so-called realistic studies (history, geography, natural history, and science) in German people's schools.*

|                             | First year. (a) | Second year. | Third year. | Fourth year. | Fifth year. | Sixth year. | Seventh year. | Eighth year. |

*a* In this and the following table the years of the course are mentioned, since the grades, not being uniform, would give no adequate idea. In schools of six grades the grade corresponds to the period from the sixth to the eighth year; in schools of seven grades, to the period including the seventh and eighth years. The tables, arranged accordingly, will speak for themselves. The numbers in the columns signify the number of hours per week.

<sup>1</sup>The study of home geography, when preparatory to geography, is included, while elementary object lessons are not included.

*Number of hours devoted to religion in German people's schools.*

*a* The same in Danzig, Stettin, Posen, Breslau, Halle, Kiel, Osnabrück (Protestant schools), Bielefeld, Cassel, New Brandenburg, and Mecklenburg-Strelitz.

*b* The same in Duisburg.

*c* In Leipzig religion begins in the second quarter of the first year; in Zwickau religious instruction is prescribed for either sex; and in the second year none for boys. Bible history is commenced with object lessons.

*d* Like those in Prussia, the schools of Mannheim have only two hours for religion, choral singing is included in religion and omitted from singing.

*e* The same in Worms.

A second factor of paramount influence in the plan or course of study, as the foregoing examples show, is religious instruction. There is a great difference in the fact whether people's schools have six or seven hours of religion in the upper grade or two, as in Munich and Hamburg, or whether it be omitted altogether, as in Basel. The foregoing arrangement in form of a table will not be without value in the explanation of this point in the discussion following later on.

Whoever examines this table will be convinced that opinions on the subject of the amount of necessary religious instruction in the German Empire greatly vary. As far as it affects the subject a thoroughly frank explanation of this point is therefore permissible without provoking unfavorable criticism. The following table (p. 417) shows that preparatory departments of intermediate and secondary schools for girls essentially differ in this as in many other points, although the true cause may not be found in the facts themselves.

*Course of advanced female schools in Prussia.*

For the purpose of comparison with people's schools the lower grades suffice. As a rule, only two hours of religion are prescribed for preparatory classes of secondary schools for boys. The entire number of hours varies between sixteen and twenty-two per week. The upper grade very rarely has more. The course of intermediate schools prescribed by Minister Dr. Falk allows three hours of religion for the three lower and two for the three upper grades. The study of home geography is added to elementary branches only in the third year. History and nature study are reserved for the fourth year. Why are other regulations in existence for people's schools? Or rather, is it beneficial to people's schools to differ so widely from the institutions for wealthier strata of society?

In the next article it will be shown how and to what extent the demands of reform in the upper grades of people's schools are found realized in the courses of study of secondary institutions. This would seem an unfailing test to Americans who naturally consider the secondary school as building on the results of the lower schools.

## II. THE DEMANDS OF THE TIME AND THE COURSE OF STUDY.

The second question is: Does the course of study in the upper grade of people's schools include those branches generally considered necessary and recognized by professional teachers as essential to the education of the people?

Official regulations and general orders fail to give a satisfactory reply to this question. The previous pages have shown how the purpose of people's schools is understood in most German States, and by means of what studies they endeavor to attain the end in view. No Prussian law has reference to the subject indicated in the second question. In sketching the actual conditions we shall often meet unexpected facts face to face.

In regard to modern demands the attitude of the Prussian department of public instruction has, in general, been one of reserve. No

one knows the opinion of the central authority on public and private instruction in political economy or its position toward the study of the constitution and law. We look in vain for any reference to the matter in the numerous directions issued annually by the minister of instruction. In view of the fact that political economy is being generally introduced, a text-book for instruction in that branch for use in normal schools would be desirable. The department has, however, defined its position plainly and distinctly in reference to the one subject of domestic science or economy. In a decree of the 18th of January, 1893, Dr. Bosse, minister of public instruction, emphasizes the fact that a perceptible restriction of other studies in favor of domestic science is receiving careful consideration, but authorizes a shortening of the time of the other lessons by two hours a week. In an order of the 9th of March, 1894, the high educational importance of domestic science is likewise recognized; but in principle the study is referred to obligatory continuation schools, which do not exist for girls in Prussia. This order gives domestic science as well as manual training for boys an independent position outside of school. This standpoint is confirmed in the following words:

Even though I fully recognize the educational value of such efforts as are manifested in manual training and domestic science, and which are directed to excite and develop the mind and aptitude of youth for practical pursuits, and though I am willing and ready to promote the establishment for that purpose by appropriations in keeping with available funds, I must nevertheless insist upon it that the people's schools suffer no loss and apply their entire time in enabling youth to acquire on the basis of valuable knowledge the moral and religious education which the success of their later practical occupations demands.

In this order the minister discountenances their introduction into the school course and relegates them to free afternoons. It is further recommended to exclude theoretical instructions in nature study, computation of prices, etc., from domestic science and combine them with the appropriate disciplinary studies. In a late order of the 10th of February, 1895, provoked by the introduction of domestic science into the people's girls' schools in Posen, the minister repeats these principles, and again emphasizes that the time allowed for the present course must under no condition be shortened. If the Government continue to hold this standpoint, domestic science will not be introduced into the regular course, but retain the character of a supplementary study. It forms a part of the regular curriculum in the schools of Marienburg, in west Prussia. Domestic economy has been introduced into the schools of Berlin, Cassel, Hanau, Wiesbaden, Paderborn, Herford, Merseburg, Halle, Altona, Pinneberg, Goldberg, Haynau, Eberswald, Neumünster, Königsberg, Posen, and Dortmund; in the Kingdom of Saxony, in Chemnitz, Zwickau, Meran, Plauen, Freiberg, Rosswein, Glauchau, Wilkau, Mitweida, Limbach, Crimmitschau; in Thuringia, in Weimar, Jena, Eisenach; in Baden, in Karlsruhe, Mannheim, Heidelberg and Baden-Baden.

Appropriations for education in Prussia since 1894 allow 26,000 instead of 16,000 marks for the support of manual training for boys. Hygiene is provided for in the General Regulations, in which the study of the structure and life of the human body is placed at the head of natural-history subjects.

Bookkeeping is not mentioned in any official regulation except for continuation schools.

A visit through Prussian cities, from which later communications are at hand, proved that a systematic development of the course of study in compliance with present demands has taken place only in a few places. Hygiene most frequently receives ample consideration. As a rule a longer period is reserved for anthropology, in connection with which hygiene is taught. This is a manifest result of the requirements in Falk's General Regulations. This fact demonstrates at a glance that reforms are very easily introduced by official order, whilst pedagogical reasons alone do not have that effect. In geography and history the constitution of the German Empire and the late social-political laws are generally defined as subjects to be treated, without, however, assigning a special time for their consideration. As far as is known, political economy is provided for in Prussia in only isolated instances. Berlin has no uniform course for all studies in communal schools. The course of history requires the treatment of the constitutions of Prussia and the German Empire. Hygiene is included in the course of nature study. In arithmetic the text-books of Hellerman and Klümer are used, in which the material for examples is taken from social-political laws and economics. Cooking schools have been added to a few communal schools; attendance is optional, but stimulated by excuse from two hours of female handiwork.

The new time table for people's schools in Charlottenburg responds more freely to demands of reform. In language lessons particular attention is given to business composition. Single-entry bookkeeping is introduced in connection with arithmetic into the highest grade for boys. Girls work out arithmetical examples of domestic economy, and "are instructed how to use a book on domestic economy." Geography in the highest grade embraces the administration of justice, communal and state laws, as well as the constitution of the German Empire. In natural history practical points of view are repeatedly brought out. The course of chemistry and mineralogy for the highest grade for girls includes the following subjects: Water (filtration, baths, cooking), lighting and heating, stoves; chlorine (disinfection); phosphorus; reduction of soda; significance of sodium compounds in a household; manufacture of chinaware and glass; manufacture of earthenware (aluminum); vegetable fiber and its decomposition; manufacture of linen; cotton; manufacture of paper; starch; dextrin; gum; grape sugar (extraction of the sugar); fermentation (brewing of beer, baking of bread); manufacture of vinegar; vegetable oils; animal fat; manufac-

ture of soap; use of oils for illumination; dyes; bleaching; dyeing; calico printing; albuminoids (albumen, casein, fibrin, etc.); food and its preservation. Drawing, too, is practically taught in the upper grades.

In Dantzie, Breslau, Stettin, Kiel, Flensburg, Hanover, Bielefeld, and Cologne the course of study neither includes the specified innovations as special branches nor combines them with other studies.

In Dantzie history in the highest grade embraces the constitution of the German Empire, the navy, the protection of colonies, and labor laws. Societies have arranged for courses in cooking and manual training. In the highest grade of advanced schools in Posen, hygiene and political and domestic economy receive special attention under the heads of language, arithmetic, nature study, and history. From the 1st of April, 1895, cooking lessons are given in advanced and the three elementary schools. In the course of study for people's schools in Magdeburg the introduction of the constitution of the German Empire is compulsory. Arithmetic, as well as geography and nature study, preclude every more direct reference to life. In Halle none of the subjects in question are included in the course of study. There is, however, a private manual training school; and the material for the examples in the text-book or arithmetic by Scharlach and Haupt is derived from circumstances of the law pertaining to insurance of the aged and invalids. In Altona instruction of history in the highest grade lays special stress on "the merits of Prussian rulers in behalf of the people's welfare." In nature study the human body is studied, particularly in reference to hygiene. In connection with a girls' people's school there is a cooking school, in which pupils are taught how to prepare simple and nutritious dishes. This subject is not mentioned in the course, though. In Osnabrück the course of natural history and science includes a list of hygienic subjects (the care of healthy and impaired organs; fractures, care of the teeth, gymnastics, and hygienic attitudes; the care and strengthening of the nerves; the organs of sense; food—albuminous and farinaceous substances; salts, spices, water; articles of food and poisons; influence of air—effects of oxygen, nitrogen, carbon, and carbonic acid; the preparation of leguminous plants—soft and hard water; cooking in earthenware, copper, and brazen vessels; keeping food in closed vessels; the value of nitrogen and carbon in nourishing and warming the body; precautions in heating; ventilation; precautions in the use of gas and petroleum—cooking and illumination). In history the constitution of the German Empire is studied; late laws and the army are treated. There are special courses in manual training, in which 350 boys are instructed outside of regular school hours.

In Hagen, in Westphalia, none of the demands mentioned receives attention, but manual training is taught outside of school hours at the city's expense. Hygiene, combined with nature study, receives special attention in the highest grades of girls' schools in Dortmund. In connection with the Protestant people's schools in that city there is a class

in domestic economy in which 24 pupils at a time from the six highest grades are instructed by a specialist from 2 to half past 5 in the afternoon. Bielefeld has decided to allow for housekeeping and cooking schools. In Cologne several courses of manual training are conducted during free afternoons. In Cassel law is combined with history and religion, hygiene with nature study, and political economy with arithmetic. The reader for the upper grade has an appendix on political economy. The girls of the highest grades in arithmetic are directed how to keep an account book; those of the eighth year are instructed in housekeeping four hours a week. Beginning with the year 1896, housekeeping, combined with cooking, will be introduced into the elementary schools of Wiesbaden by way of experiment. Reports from that city further state that an effort has been made in all the schools to meet modern demands in history, geography, and arithmetic. In Biebrich, on the Rhine (near Wiesbaden), hygiene is included in the course of study; law, political economy, and housekeeping are occasionally touched upon, with other branches.

In the course of study in people's schools of Bavaria the following regulations deserve mention. Bookkeeping for girls as well as boys is to be combined partly with written language work and partly with arithmetic (official orders of January 26 and February 16, 1891). An official order of December 16, 1875, requires pupils to be instructed in the principles of hygiene, partly in connection with reading and partly with nature study. As people's schools of Bavaria have obligatory continuation schools and supplementary summer schools in which the branches mentioned are treated, these demands step into the background in actual practice in the lower schools. In the course for people's schools in Munich none of the demands mentioned are considered. Since the 1st of March, 1895, the Society for Popular Enlightenment, of that city, has instituted a housekeeping school; a course in cooking will also be opened. In Nuremberg these branches are only occasionally touched upon. In Augsburg, as in Munich, elementary study of law is reserved for obligatory continuation schools. Domestic economy is taught in the advanced female school. The city of Würzburg intends to develop people's schools according to more modern demands.

The people's schools of Württemberg are prevented from meeting modern demands by their peculiar arrangement of school sessions. In Stuttgart only hygiene receives special attention. The reader contains a few instructions on the constitution of the country.

The people's schools of Saxony leave law and political economy to obligatory continuation schools. In Leipsic and Dresden sufficient attention is given to hygiene. In Leipsic the highest grades of advanced and elementary schools devote a special hour to anthropology and hygiene. In the grade below the subject forms a part of general instruction in natural history. The course of study is as follows:

*Seventh year of course.*—Introductory view of the parts and vital

functions of the human body. Digestion and its organs, circulation of the blood, respiration, secretion (particularly secretions of the skin). In this grade the organs and their functions are treated only in so far as they lead to the deduction and foundation of rules of health.

*Eighth year of course.*—This grade deals with the more difficult chapters of motion and sensation, a proper understanding of which leads to the study of the skeleton, muscles, skin, nerves, and organs of the special senses. Besides the structure and functions, the care of the organs is discussed. The chief lessons of the grade below are reviewed and elaborated. In connection with digestion the more important articles of food are discussed. Toward the end of the year a set of rules of hygiene are deduced from the lessons, and children are instructed how to assist quickly in cases of sudden sickness and accident.

Both cities afford opportunity for instruction in manual training, though it is not of necessity connected with the people's schools. Law and political economy are likewise adopted in the course of continuation schools in Zwickau. Manual training is taught in a private school, partially supported by the State and city, in 14 grades, to 224 boys, by 9 teachers; 42 girls receive instruction in domestic economy and housekeeping in the cooking school connected with burgher schools. The course lasts fourteen weeks, and is conducted in the afternoon.

In the people's schools of Baden domestic economy has found ample consideration. In Carlsruhe alone there are 13 grades of domestic economy, engaging 7 female teachers. The study is pursued during the last two years in girls' elementary and advanced schools. During geography lessons in the upper grade the natural and manufactured products of countries are discussed in particular; in boys' schools those that are frequently met with in business intercourse, trade, and commerce; in girls' schools those used in housekeeping. The constitutions of Baden and the German Empire are treated under history in the upper grade. In Mannheim girls of the upper grade likewise receive instruction in cooking, given in four hours per week, as a rule during free afternoons. Manual training has been introduced into boys' schools. The hope is entertained that this branch will soon be introduced into the highest grades of people's schools. In people's as well as in advanced schools instruction is given in connection with the appropriate lessons of the third part of the reader officially introduced. Mannheim has advanced schools only—that is to say, every elementary school is a fully graded one of at least eight grades. Hygiene, to which one hour a week is devoted in the sixth year, is a part of the study of natural history.

Advanced schools in Mannheim—really advanced people's or burgher schools in the sense of the law—have a thoroughly modern character. They are “specially designed to equip pupils in the highest degree with the knowledge and ability necessary for their later practical life.” In

the upper grades business correspondence and single-entry bookkeeping, and in the eighth grade political economy, receive special attention. The advanced schools of Mannheim are the only German people's schools known in which political economy forms a special branch of study. Instruction under the following heads is given two hours a week: (1) Man as an individual; (2) the family; (3) communities; (4) the state and its constitution; (5) labor and the accident insurance laws; (6) capital; (7) political economy, societies; (8) trade and commerce; (9) money; (10) credit; (11) finances; (12) army and navy.

In Hessa the course of study prescribed for people's schools of four grades requires that the highest grade in history learn "the most important events in Hessian history with regard to political institutions and the constitution." Natural history in the same grade treats of the "structure and life of the human body, and laws of health." In Worms law and political economy are taught in connection with history and arithmetic.<sup>1</sup>

For the last four years manual training has been taught in connection with drawing. Since the spring of 1895 the highest grade of girls receive compulsory instruction in domestic economy four hours a week. School Inspector Scherer, of the people's schools in Worms, advocates transferring domestic economy to continuation schools, but mentions that the practical carrying out of this plan would meet with local obstacles.

Law, domestic science, hygiene, and political economy are not prescribed in Darmstadt. These studies are referred to obligatory continuation schools and housekeeping schools, attendance in which is optional. The course for schools of eight grades in Mayence introduces the regulations quoted in the foregoing plan without further specialization.

In the course of study for elementary schools in the Grand Duchy of Saxe-Weimar<sup>2</sup> no attention is paid to the branches under discussion. At the same time, in all schools "where it is necessary and practical the teachers must instruct the older boys in fruit-tree culture outside of regular lessons." In the city of Weimar hygiene and domestic economy (for girls) is included in natural history in the upper grades. Manual training has been introduced into the second burgher school. Instruction in horticulture is optional.

In both Mecklenburgs none of the demands of modern life seem to have been considered. It must be remembered, however, that manual training was introduced as early as 1862 in the normal school at Neukloster. The time set aside for this branch has been gradually diminished, owing to the reactionary tendencies which at present are brought

<sup>1</sup> See Scherer's *Guide to Teachers*, Vol. II, pp. 121-133.

<sup>2</sup> School legislation in the Grand Duchy of Saxe-Weimar. Hermann Bohlau, Vol. II, pp. 93-101.

to bear upon manual training. The teachers have no special love or preference for this branch.<sup>1</sup>

The foundation for the course of study in Protestant people's schools in the Grand Duchy of Oldenburg contains no specialized statements. From the city of Oldenburg, where school commissioners and the board of directors regulate the studies, it is learned that in consequence of the course outlined law is treated of under history and geography; political economy, hygiene, and domestic economy under arithmetic, natural history, physics, and manual training. In arithmetic the laws pertaining to the care of the aged, infirm, and the sick are touched upon.

The conditions prevalent in the principalities may be condensed in the following remarks. In the upper grade of boys' free schools in the city of Meiningen manual training has been introduced (four hours a week during free afternoons). The pupils of advanced schools are instructed two hours a week in manual training, but attendance is optional. Manual training was introduced in Gotha in the fall of the year 1895. Instruction in domestic economy will be given in the upper grade of elementary schools for girls, in compliance with the prescribed course. In the Grand Duchy of Altenburg none of these branches has received attention. Since fall of last year manual training has been introduced by way of experiment and as an optional study in the three upper grades of intermediate schools in Zerbst (Anhalt). No other demand has been recognized. In Lemgo (Lippe) arboriculture is compulsory during the last two years. In Arolsen (Waldeck) hygiene is taught under the subject of natural history, as also under natural science and language, combined with reading. Law is partially discussed under geography. The laws pertaining to the aged and invalids are treated under arithmetic in the highest grade. The same course is adopted in Arnstadt (Schwarzburg-Sondershausen). In Reuss (junior line) modern demands have received no attention. In Bremen hygiene is taught in the highest grade under the subject of natural history. The newly revised course of study for the people's schools of seven grades in Hamburg prescribes anthropology and hygiene for the highest grade. The rest of the course takes none of the aforementioned demands into consideration. In Lubeck none of these studies is pursued.

In Alsace and Lorraine very different conditions prevail. In Mülhausen (in Alsace) housekeeping in the two upper grades is combined with language and female handiwork. A manual training school has been in existence since 1880; during the year 1894-95, 380 boys were instructed outside of regular school hours four hours a week. Law (labor laws) is discussed under arithmetic.

---

<sup>1</sup> Twenty-first Report on Intermediate and Elementary Schools in Parchim. Easter, 1894, pp. 3-10.

The character of Austrian people's and advanced schools has been already sufficiently dwelt upon. According to the law of May 14, 1869, the Fatherland and its constitution are to be specialized under geography and history. In language, pupils are to be familiarized with the form and requirements of the most important business compositions. In arithmetic economical, industrial, and simple mercantile calculations are to receive attention according to local relations and the future pursuits of the pupils. Girls are to be particularly drilled in housekeeping calculations. The course of study for that branch states: "Arithmetic in connection with single-entry bookkeeping." Natural history concludes with anthropology and hygiene. Physics and chemistry are also taught from a practical point of view. The advanced schools of Vienna have a very pronounced industrial character, apparent from the division of time in boys' schools, in which eighteen of the thirty hours a week are distributed as follows: Five to free-hand drawing; three to geometry; four to arithmetic and bookkeeping; four to natural science; two to natural history. The highest grade of community schools in Berlin, by way of example, allow twelve out of thirty-two hours a week for the stated branches collectively.

In the people's schools of Switzerland modern practical demands meet the fullest consideration in the upper grades. In the grammar schools of Zurich bookkeeping and hygiene, for instance, occupy a permanent place, as well as in Basel, where the study of the constitution is combined with history. The course of study in the southwestern cantons corresponds with the French throughout.

French people's schools adapt themselves in every way to practical demands. According to the law of March 28, 1882, "laws and political economy" must be provided for outside of lessons in morality and citizenship peculiar to French schools. The elements of mathematics and natural science are applied to agriculture, industries, and hygiene. Manual training is almost everywhere found in France. The course of study in the higher people's school (*école primaire supérieure*), it seems, is too much subdivided. It devotes special time to the subjects of bookkeeping, agriculture, horticulture, political economy, and female handiwork under separate heads, and, moreover, mentions civil law in connection with history and hygiene as a part of nature study.

English people's schools seem to be dominated by a utilitarian spirit. Domestic economy receives special attention.

Comment upon American schools is superfluous.

## VII.—NORMAL SCHOOLS IN SWITZERLAND.

## INTRODUCTION.

The annual report of the Commissioner of Education for 1891-92 contained a statement of the history and methods of training teachers in central Europe, in which the normal schools of Switzerland were duly mentioned, but not described. The present chapter treats of them more fully, and enters into details which will, it is hoped, be especially welcomed by normal-school teachers in the United States, inasmuch as they offer information which will afford opportunities for comparison.

In the years 1870 and 1875 J. J. Schlegel, specialist in historical sciences in St. Gall, published two works on the condition of normal schools in Switzerland during the years 1868-69 and 1871-72. In the first of these publications the subject was treated from a pedagogical and historical standpoint; statistics furnish the main substance for the second, which was called forth by Professor Kinkel, of Basel, statistician of schools for the World's Fair at Vienna in 1871, and formed the fifth section of the statistics of education in Switzerland published in part in 1875. A more recent presentation of the subject is contained in the statistics of education arranged for the Swiss Exposition in 1883 by the author of Grob's Yearbook and Prof. D. Hunziker, of Zurich. They have classed normal schools under higher schools of the different cantons, and have examined normal school conditions as they actually existed in 1881-82.

Partially digressing from the plan hitherto adopted in similar works, the following treatise, prepared from information furnished by Grob's Yearbook, will rather compare than separately examine individual institutions. A treatise on normal schools seems timely in this country, since in a number of American States the question of professional preparation for teachers has again become a subject of deliberation in educational and legislative bodies, and especially will information be welcome that comes from a sister republic.

The questions proposed in circular letters addressed to the principals of Swiss normal schools were limited to organization (course of study, practice schools, number of hours per week, beginning and length of the school year, boarding schools), teachers (number, appointment, salary, supervision), students (number, age, preparatory education, terms, scholarships, free tuition, absences, unions, graduation), and the receipts and expenditures during the year 1890.

An answer of some kind was received within six or eight weeks from every one of the thirty-six authorities consulted.

The greater number of normal schools in Switzerland owe their foundation to the general movement which, in the third decade of the present century, pervaded Switzerland in favor of better education in

general. Only one of these schools dates back to the last century, and one to the second decade of the present century. The following list gives the date of foundation of normal schools in Switzerland:

(a) *Public normal schools.*

|  |      |
|--|------|
| Normal school of the Canton Lucerne .....  | 1775 |
| Normal school in Aarau .....   | 1822 |
| Male normal school in Küssnacht (Zurich).....  | 1832 |
| Male normal schools in Munchenbuchsee (Berne), Kreuzlingen (Thurgovie),<br>Lausanne (Vaud) .....   | 1833 |
| Male normal school in Soleure.....   | 1834 |
| Male normal school in Pruntrut (Berne), female normal school in Delsberg<br>(Berne) and Lausanne (Vaud), male normal school in Lugano, now Locarno<br>(Ticino) ..... | 1837 |
| Female normal school in Hindelbank (Berne).....  | 1838 |
| Girls' school, with female normal school, in Berne .....   | 1841 |
| Two state normal schools for German and French teachers in Sitten (Valais)...  | 1846 |
| Normal school for female teachers in Sitten (Valais).....  | 1850 |
| Normal school at Hauterive (Fribourg), male normal school in Chur (Grisons).....   | 1852 |
| German normal school for female teachers in Brieg (Valais); normal school<br>for male teachers in Rickenbach (Schwyz).....   | 1853 |
| Male normal school in Rorschach (St. Gall).....  | 1856 |
| Female normal school in Zurich .....   | 1876 |
| Normal school for kindergartners in Neufchatel.....  | 1890 |

(b) *Private normal schools.*

|   |      |
|---|------|
| Male normal schools in Schiers (Grisons).....   | 1837 |
| Female normal school in Menzingen (Zug).....  | 1844 |
| New female school (continuation school) in Berne.....   | 1853 |
| Female normal school in Ingenbohl (Schwyz); male normal school in Muristal-<br>den (Berne)..... | 1865 |
| Protestant male normal schools in Bondey, now in Pescux (Neufchatel).....                       | 1866 |
| Protestant male normal school in Unterstrass.....   | 1869 |
| Catholic male normal school in Zug.....   | 1880 |

The cantons of Neufchatel and Geneva have never had real normal schools, but have arranged special divisions in the secondary schools for the training of teachers.

In Switzerland there are at present 37 educational institutions devoted, either exclusively or in one of their divisions, to the training of teachers; 22 of these belong to German, 13 to French, and 2 to Italian Switzerland. In reference to sex, there are 13 female and 23 male normal schools and 1 mixed normal school.

## I. ORGANIZATION.

(1) *General remarks.*—Two groups of normal schools may be distinguished according to the plan of organization.

The first is closely allied with the cantonal secondary schools. Future teachers receive their general and scientific education in common with younger pupils who are qualifying to enter a university or a higher technological school, or completing their preparation for practical life with a secondary school education (Zug, Soleure, Chur,

Schiers, Neufchatel, Geneva). For a general preparation lower or preparatory grades are arranged. Still, most pupils of the pedagogical section are not advanced from the lower grades of the institute itself, but come from the general people's and grammar schools throughout the State. Normal schools for women, as a rule, do not educate teachers exclusively, but are either closely or distantly connected with higher female schools, which begin where grammar schools leave off, and aim at a general education (Zurich, Berne (2), Ingenbohl, Menzingen, Fribourg, Aarau, Neufchatel, Geneva). Of late years one of these institutions (Zurich) has partially assumed the character of a classical high school, so that pupils who wish to prepare for admission to a university pursue particular courses as necessity dictates. Because of its organization another (Fribourg) may be styled a female normal school "in embryo," as it contains but 2 grammar and 2 normal grades, and dismisses pupils at so early an age that they can hardly be fully equipped for directing a school.

The second group embraces about two-thirds of all normal schools. Allied with common elementary or grammar schools, they are exclusively concerned in the education of teachers whom they fit out in a shorter or longer time to be excellent conductors of primary schools. Several among them have preparatory grades (Rickenbach, Schiers, Peseux). The larger cantons are at present again publicly discussing the question whether the first or second of these groups tends most toward practical results (Zurich, Berne, Aarau). Two normal schools for men have very recently gone over from the latter to the former group (Zug, 1887; Soleure, 1888).

If the settlement of this question devolved upon teachers, it would long since have been effected in Zurich by the decision to combine the normal school with the cantonal secondary schools, or perhaps by satisfying the simultaneous demand for appropriate arrangements for special professional education at a particular institution or at the university.

In Aargau a large majority of teachers have taken a similar standpoint. In repeated petitions to the Federal Legislature or Council they have expressed the wish that normal schools be transferred to the capital, and that their general scientific sections be combined with the cantonal intermediate schools. Recently a new petition for the purpose has, by instigation of the government councilor, been set aside by the Federal Council, but the question can hardly rest until the wishes expressed have met with some kind of recognition.

The plan of separating the sexes, formerly general, has been disregarded by the State normal school in Kussnacht (Zurich), which for the last twenty years (since 1873) has admitted girls. After completing a four years' course in common with boys, girls are allowed to take the same test examination. The greater number afterwards teach in elementary schools for both sexes.

(2) *Age of admission.*—It is very gratifying to notice that those destined to be teachers are not allowed to undertake their difficult

task too early in life. The greater number of normal schools require completion of the fifteenth year before entrance. Others prescribe the sixteenth year: Zug, Thurgovie, Vaud, Neuchâtel (male), Geneva (female). The normal school for women of Neuchâtel does not admit pupils under 17 years of age. In this respect conditions are not so uniform as they appear in the statistical tables. Here and there the regulations are rather undecided, and admit of different interpretations. As a rule, nearly all exceptions are in favor of admitting older and not younger pupils than the regulations prescribe. The general view seems to be that teachers should not enter into practical service until they have completed their twentieth year.

(3) *Preparation.*—Normal schools that admit students whose knowledge and ability are not above what an elementary school affords are lessening in number year by year. Even when regulations do not demand a higher preparation a gratifying number of pupils, when admitted, have a more or less complete grammar-school education (Berne, Schwyz, Fribourg, Grisons, Ticino, Vaud, Valais).

The following is an extract from the annual report (covering the period from 1884 to 1888) of the directors of the normal school at Hofwyl:

About two-thirds of the new students are pupils of advanced and one-third of simple elementary schools. As examinations are arranged by rule according to the elementary school course of study, they can be passed by capable and well-prepared pupils of elementary schools. Good pupils of advanced schools, however, continue to have a decided advantage during the course. The question forces itself upon us more and more whether one of the conditions of admission should not be a uniform preparatory education which would be a sure foundation for a normal course. (Martig.)

It seems that private normal schools pay particular attention to this point. Even in those cantons where legal regulations define the course of an elementary school as sufficient private normal schools take the precaution of replacing attendance at a grammar school either by preparatory instruction or the support of excellent candidates, so that newly admitted pupils, as soon as possible, attain a certain uniform level, and can without further drawbacks apply themselves to preparing for examination. They recognize a thorough preparation of their students as the chief means of being able to compete successfully with the State normal schools.

Normal schools for men frequently receive students who, actuated by zeal and a free resolve, decide upon teaching as their vocation only after they have entered upon practical life. Such usually are sensibly deficient in knowledge; but the earnestness and zeal which they devote to their self-chosen calling advance them to the first rank. It is most gratifying to notice that teachers are supplied from all parts of the country. If we examine the lists of twenty admitted pupils according to the places where they have received their first schooling, we find represented all places, large and small, mountains and valleys, city and country, even to the most insignificant and forlorn villages.

(4) *Beginning and length of course.*—The number of years required for the education of male and female teachers ranges from one to four. There are 10 institutions with four, 2 with three and one-half, 18 with three, 5 with two years courses, and 2 with a one-year course. The inequality seems somewhat less striking when we consider that of the 18 normal schools with a three years course 4 prescribe the completion of the sixteenth year, and that 1, the female normal school in Neufchatel (pedagogical section of the cantonal gymnasium), admits pupils only after the seventeenth year is completed. The standard by which a teacher's education is measured seems to vary as much as the valuation of that knowledge and ability which the common schools afford to children entering upon practical life, or the estimation placed upon the worth of people's-school teachers in general.

Within the last ten years there has been an evident effort in several cantons toward shortening the time of instruction in normal schools. So far they have been unsuccessful. In the Canton of Berne the extension of time from a three to a four years course for the State normal school in Hofwyl, decided upon in 1880, could not be carried into effect. Under the pressure of a temporary want of teachers the grade referred to was, in the fall of 1883, admitted to the examination for diploma, whereupon the decision rendered by the government councilor on the 30th of January made the three-and-one-half-years course permanent. In his annual report the principal expresses the regret that the four years course which the teachers attempted to introduce failed of success. In the Canton of Aargau an effort was made to abolish the fourth (highest) grade at the State normal school in Wettingen and limit the course to three years; but this, so far, has met with too ardent an opposition from teachers and authorities. The most recent efforts tend toward extending the course of study at the female normal school in Aarau to four years, to correspond with that of the State normal school.

In the Canton of Zurich the advocates in favor of shortening the course have received no attention.

In Thurgovie, on the other hand, repeated efforts have been made to extend the three years course for elementary-school teachers to four years. In 1873, however, the project countenanced by the government was not favored by popular vote. In 1882 normal-school teachers advanced a new idea. With the introduction of the fourth course (so reads their memorial) there would come a year in which no students would be graduated; as a consequent result there would be a better adjustment between the number of unengaged teachers and vacancies to be filled. Students who now leave at the end of three years without receiving appointments would be better cared for by the fourth year's course; at the same time the schools would be greatly benefited. The demands upon a normal school education so increase from year to year that they can hardly be satisfactorily complied with in three years.

The extension of normal-school courses has recently been agitated in other cantons; in Berne, for instance, it has been successfully carried out. The authorities have thought best to defer all further mention of the former project "until the question of carrying the twenty-seventh article of the constitution, concerning the province of federal legislation, into effect had been to some extent cleared."

Twenty normal schools open in spring (April or May); 17 in the fall (September or October). South, west, and middle Switzerland usually adopt the latter custom; the customs of Berne, Schwyz, and Vaud follow east Switzerland in this respect. The State normal school of Grisons opens in the fall; the private normal school of Schiers, together with the other normal schools of east Switzerland, in the spring. The normal school of Hofwyl (Berne) stands alone in admitting new pupils in the spring, but reckoning the school year from fall to fall, the first is therefore only a half-year course.

A ten-weeks vacation is fairly uniform. Only two normal schools (Kreuzlingen and Unterstrass) allow less time, nine weeks. Soleure and Muristalden have eleven; Hitzkirch, Locarno, Sitten, Brieg, each twelve weeks' vacation. The last three open in October and continue uninterruptedly to July, so that there are nine months of school and three of vacation. As these institutions are boarding schools, students spend their vacation at home; in case of remaining at the institution they are charged an extra fee for the length of time they stay. At other schools, as a rule, the vacation is so divided that two weeks come in spring, four in summer, and two in autumn. Generally there is no instruction between Christmas and New Year. In Valais, at the beginning of the school year in September, two monthly courses of review are conducted by already appointed male and female teachers. In this case the lower grades have vacation till the 1st of November, while the upper grades begin on the 1st of September.

(5) *Studies*.—(a) *General education*.—Two to four hours a week are devoted to religious instruction throughout the course. The normal schools of Kussnacht and Zurich limit this study to biblical history. The course of study in the public schools of Neuchâtel and Geneva do not include religious instruction, which is left to the family and religious societies. Several normal schools (Hindelbank, Berne [new female school], Muristalden) teach the method of religious instruction combined with practical exercises. Private normal schools make a point of differing from the public by devoting more time to religion.

Language, to which from five to ten hours a week are devoted through the entire course, is a prominent study in all normal schools. The vernacular receives more attention throughout French and Italian than in German Switzerland, where natural science and mathematics rank as equally important or, in some cases, higher if measured by the amount of time devoted to it. Foreign languages, on the other hand, are generally more earnestly studied in German than in French normal

schools. All, excepting the male normal school in Hauterive and the female in Lausanne, teach a second language; German and Italian schools, French; and French schools, German. The male normal school in Locarno teaches German as a second foreign language, which is an optional study.

The pedagogical section for teachers at the College of Geneva is exceptional in reference to foreign languages. The course of study in this institution allows throughout the four-years course more hours a week to German (five) than to French (four). This is not altogether due to the fact that a law recently passed in the canton requires German to be taught in elementary schools. Young teachers who, owing to the small area of the Canton of Geneva, are sometimes necessitated to look for employment in other cantons and abroad can more easily obtain positions if they have a better knowledge of German.

Italian forms a part of the curriculum in the female normal schools of Menzingen and Aarau and the male normal school of Schiers, but is studied rather by students who do not intend to be teachers. English is an optional study at 2 male normal schools (Kussnacht, Schiers) and at 6 female normal schools (Zurich, Berne (2), Menzingen, Fribourg, Aarau).

Latin is an optional study at the male normal schools of Kussnacht and Zurich, at which latter institute it is taken up by students intending to enter the university. The importance of this study for future teachers is shown in the following remarks of the director of the college at Geneva:

I often receive applications for teachers from foreigners with the request not to recommend anyone unable to teach Latin. Now our pedagogical section makes no mention of this language in its curriculum; when I show the results of graduates' examinations I am told that the young gentlemen are not sufficiently prepared. Consequently nothing is left for these young men but to follow the career of an elementary-school teacher.

The time devoted to mathematics is very unequally distributed in different normal schools. The average number of hours a week during the course varies between three (Neufchatel, female pedagogical section) and five and one-half (Kussnacht). As a rule, male normal schools devote more time to this branch than female. The female normal school at Zurich, the only exception in this respect, must conform to the State normal school for men at Kussnacht, owing to the fact of having the same test examination in everything but surveying.

First in order, according to the number of hours employed for mathematics, are the normal schools of Kussnacht (twenty-two), Unterstrass (twenty-one), Zurich, Soleure, and Wettingen, each twenty, with a four-years course each; the least time devoted to the study of mathematics is by the female normal schools of Fribourg and Lausanne (nine), Locarno (eight), Geneva (two), Neufchatel (three), and the male normal school of Neufchatel (eight). Keeping accounts and bookkeeping are also

included in mathematics, sometimes forming a special branch, as in the male normal institutes of Ingenbühl, Menzingen, Hauterive, Fribourg, Kreuzlingen, Locarno, Neufchâtel, Geneva, and Peseux, and sometimes combined with other studies, as in Hitzkirch with arithmetic and in Muristalden with writing. A certain number of schools do not advance this study beyond the standard of a first-class elementary school; others, again, in this respect assume the character of actual secondary schools by facilitating a promotion into the university.

Natural science is entirely neglected in the female normal schools of Valais, and varies in importance in other institutions. The male normal school in Küssnacht (twenty hours) and the pedagogical section of the college in Geneva (eighteen hours) rank foremost in reference to the number of lessons in this branch. They are followed by the female normal school in Zurich and the male normal school in Wettingen (seventeen hours). Only the male normal schools of Küssnacht, Zurich, Hofwyl, and Geneva have a laboratory where pupils can make experiments, and manipulate at least the most important physical and chemical apparatus. More modest arrangements are elsewhere provided.

In some places hygiene forms a special branch of natural science (Hauterive, Locarno, Lausanne, and Geneva); in others it is appropriately combined with other sciences (Küssnacht, Zurich, and Schiers).

Agriculture is likewise pursued in several normal schools, as, for instance, in Hitzkirch, Hofwyl, Delemont, Muristalden, Hauterive, Zug (fruit-tree culture), Soleure, Rorschach, Chur, Wettingen, and Sitten. Theoretical instruction in agriculture is generally combined with practical exercises in gardens and fields. Pupils are interested in agriculture at the normal schools of Hofwyl, Pruntrut, Muristalden, Rickenbach, Zug, Hauterive, Rorschach, Chur, Wettingen, Kreuzlingen, and Sitten. At the male normal schools of Valais natural science consists in instruction in agriculture and cattle raising (meadow culture, growing vegetables and fruit, culture of useful plants, cattle raising, dairy work, etc.).

The same amount of attention is universally given to history and geography. The number of lessons a week in these branches show no such important differences as in nature study. Most courses of study include three lessons a week for history and two for geography. Where mathematical and physical geography form special branches the former is occasionally included in mathematics; the latter in nature study. The history and geography of Switzerland naturally receive the greatest attention.

In the male normal schools of west Switzerland civics (instruction civique) is treated as a separate study; in German normal schools for men the study of Fatherland, law, and constitution are united with history and geography, or connected with the latter as a concluding chapter (Küssnacht, Hofwyl, Rickenbach, Hitzkirch, Wettingen). A study of the federal constitution has been expressly introduced into some

courses as a compulsory study. We sometimes hear that the curriculum of normal schools for men, like secondary schools, includes the study of civic relations; but because of "lack of time" this knowledge is in reality left to be self-acquired in practical life. The fact is being better understood every day that the main thing to be considered in teaching history and geography is not mere memorizing of names, dates, and numbers, but a proper understanding and appreciation of the events themselves and, in particular, the important movements in the history of civilization.

Singing occupies a prominent place in all normal schools, having as many as 5 lessons a week. Instrumental music is not taught at all in 9 female normal schools (Berne (2), Aarau, Locarno, Lausanne, Brieg, Sitten, Neufchatel, and Geneva); in two institutions (the female school in Fribourg and the male normal school of Locarno) it is an optional branch. At the other normal schools, as a rule, one instrument, with 2 lessons a week, is obligatory, and a second optional. The violin is the most popular instrument, followed by the organ, piano, harmonium, and cithern. The latter is taught in several normal boarding schools for young women.

Drawing is taught in all normal schools at least two hours a week. Kussnacht, Unterstrass, and Soleure lead, with 12 lessons a week each; Lausanne (male teachers) numbers 11, Zurich (female teachers) 10 lessons a week. Other institutions are giving increased attention to drawing, as its value in manual training and industrial pursuits is being more generally recognized.

Penmanship receives very different degrees of attention. Some schools have but a one-year course, with 1 lesson (Zurich, Locarno, and Geneva); others combine it with bookkeeping (Pruntrut); others again devote to it as many as 7 lessons a week (Rickenbach, Lausanne (for men), and Menzingen).

Gymnastics are under federal supervision. The cantonal board of school directors were formerly required to hand in, after every inspection, a statistical report, made out according to a given scheme, which has since been exacted by the military department of Switzerland at least once a year. The cause of gymnastics will hardly be promoted in normal schools until the military preparation in the cantons is substantially supported by the Federation in word and deed. Federal supervision, however, draws the attention of the cantons at least once a year to this department. The number of lessons a week is much more uniform than in most other branches (2).

Several normal schools for women have as yet not adopted gymnastics into the regular course (Brieg, Sitten, Ingenbohl, and Menzingen).

Where male normal schools are divisions of secondary schools (Chur, Soleure) the students participate in the military exercises.

Manual training for boys has lately begun to be introduced into all normal schools in which handicraft is pursued independent of agricul-

ture (Hofwyl, Pruntrut, Muristalden, Locarno, Lausanne, Neuchâtel, and Geneva). It is taught mostly in the upper grades in 2 to 4 lessons a week, and promises to pave its own way into general people's or elementary schools.

As a rule, the theory of housekeeping is combined with female handiwork, to which all normal schools, excepting those of Zurich and Aarau, devote from 3 to 4 lessons a week. There still exist a few traces of the arrangement formerly in vogue of teaching French, for instance, simultaneously with female handiwork. In the female school in Fribourg cooking, ironing, and garment cutting are taught, in addition to the usual female handiwork of knitting, sewing, and embroidering.

(b) *Professional education.*—For various reasons most normal schools do not qualify future teachers for their vocation as well as might be desired. In the first place, the time allowed for training pupils is too short for them to acquire more than a certain elementary knowledge of the general subject-matter of instruction; a thorough drill in the practical part of teaching is not permissible. In the second place, candidates while in attendance at school are too young to appreciate and apply the studies of psychology and didactics. The matter is in itself so difficult that even normal-school teachers are not always its exact interpreters. Finally, the inadequacy of existing arrangements for practical exercises prevents the desired success. The schemes submitted to the authorities referred particularly to existing provisions for the promotion of practical pedagogy. Because of the importance of the subject, the following analyses of the minutiae of the information received may be welcome.

Usually two hours a week for one to two years are devoted to general pedagogy. In this assignment of time no essential differences in the various institutions are shown. The history of education offers no occasion for comment. In some schools it follows, in others it precedes general pedagogy. In some the subject is presented from the earliest times to the present, in others character sketches are drawn, combined with the reading of modern pedagogical works (i. e., Lienhard und Gertrud). Theoretical didactics is either connected with all the studies or treated as a separate special branch. With reference to language, arithmetic, and singing, the teachers of practice schools or specialists comment on the methods of teaching as occasions present themselves. General pedagogy and methods are usually taught by different teachers. The normal school for men in Kussnacht is an exception in this respect; of late years the same arrangement prevails that was in vogue at the opening of the institution fifty years ago. These two studies have been so combined that pedagogy is taught by the instructor of methods or didactics. As the latter is at the same time the director of the practice school, he is in that capacity partly represented by a capable young teacher. Thus it is hoped to deepen the knowledge of methods by means of the science of pedagogy and to make pedagogy more practical and fruitful by means of the study of methods.

The ways in which future teachers are initiated in the practical pursuit of their calling are manifold, and yet to some degree uniform. Candidates for the position of teacher are obliged to attend a school, first to notice and listen, then to take an active part, first in one, later in several grades, and finally to discuss their experiences and observations under competent directors, by whom their attention is drawn to deficiencies and mistakes. They are also required to write out pedagogical exercises and study works on methods of teaching.

Practice schools corresponding to the schools in which teachers are later engaged are combined with most normal institutions. The want of such an arrangement is regarded as a deplorable deficiency, and earnest efforts are made to supply the want. Candidates can, it is true, attend a few public schools and sections for observation and attention, but they have no opportunity for practicing where a practice school is not in organic connection with the normal school.

The following examples of professional preparation at normal schools will explain the above conditions better:

Pupils of the highest grade receive 3 lessons a week in the theory of general and special didactics or methods, and are made acquainted with the means of instruction obligatory in people's schools. Besides, every three days they take turns in visiting practice schools, where they have occasion to participate in teaching. In addition, each one for two or three weeks conducts a certain study in a single grade, and in conclusion undertakes the direction of the entire school. (Kussnacht.)

In the third (next to the highest) grade young ladies receive 2 lessons a week in special methods, are made acquainted with the means of instruction, and begin with practice lessons. General methodology, special methods of teaching, and the study of schools are taught in the fourth or highest grade. Practice lessons, conducted at times by teachers and at times by students, and visits to the different grades of city primary and grammar schools, combined with practical exercises, inculcate the knowledge of conducting schools. Every student has the benefit of a two-weeks attendance at the elementary, historical, and scientific sections of practice schools. (Zurich.)

Every student of the senior grade gives a week's attention in practice schools, and teaches a few lessons; the second week he conducts the school under the teacher's direction and supervision. Each one of two senior students conducts one lesson a week, in which preparation and application of methods are discussed. (Unterstrass.)

The 5 primary schools of the town of Munchenbuchsee are practice schools. In next to the last year's course one hour a week is devoted to visiting primary schools; in the last course three hours a week are spent in visiting intermediate and high schools; one hour a week is given to criticism and the discussion of lessons. Where it is considered necessary, teachers of practice schools assign model lessons on a given subject as a practical exercise for the pupils whose treatment is subsequently discussed. (Hofwyl.)

Pedagogy includes general methodology and the method of teaching language with practical exercises. The methods of other branches in the course of study are taught by different teachers. The pupils of both upper grades are called upon in turn to teach in practice schools. The senior class is by degrees employed in directing every grade of the school. They keep a journal in which they note all the details of their doings and the observations made. The teacher in charge of the practice school supplements his remarks on the aptitude of the pupils from the

standpoint of discipline and pedagogy. Being in accord with specialists and the teacher of pedagogy, he is commissioned to give pupils all necessary practical directions. Explanation and criticism of practice-school journals take up part of the time devoted to methodology. (Principal Perrentruy.)

Practice in teaching, most closely united with the science of pedagogy, is effected by model lessons, visits to schools, trial lessons, and practical exercises in normal and practice schools. (Hindelbank.)

In winter every senior student, at least for a whole week at a time, acts as assistant in a grade assigned by the model teacher, by whom he is thoroughly drilled in management and discipline. In order that the schools suffer as little as possible from having too many teachers and from the inexperience of normal school students the latter are obliged to make very exact and uniform preparations. This is accomplished by instruction in methods and accompanying exercises, lectures, and criticism. The students write out their preparations in a copy book, which is submitted to the teacher for examination and approval. (Organization of the normal school at Muristalden, Bern.)

Three divisions are distinguished in practical pedagogy. In the first, young ladies listen to a model lesson conducted by the class teacher; in the second, they repeat a prearranged trial lesson; and in the third, entirely conduct a lesson on a given theme. Every week the whole senior class spends half a day in a city school, where it separates, so that each student has the benefit of the above-mentioned practice in all of the five grades of the practice school. Criticism on the manner in which these practice lessons have been conducted follows in the lessons on methods. (Bern, new female school.)

During the last two years of the course students have exercise at practice schools under the supervision of the teacher in charge of said schools. They attend two by two during three consecutive days, so that each pupil has a turn about once in seven weeks. Practice schools are communal primary schools attended by children of the first three years (6 to 9 years of age); normal-school students teach alternately in each section. (Delemont.)

The third year's class has four hours a week practice in the German preparatory school connected with the institution. This school consists of the three divisions corresponding to the higher courses of the primary school, and is conducted by a class teacher. The normal-school teacher informs every student of the subject-matter a few days beforehand. While he is conducting the lesson the normal-school class is present and takes notes. A general discussion follows. The students express their opinion on teacher, mode of teaching, language, position, discipline, etc. The class teacher then rectifies the remarks made and deduces his own conclusions, giving hints for the future. The class teacher is in closest sympathy with the teacher of methods, who is also inspector of practice schools. (Zug.)

Students of the third year, during the second half, and those of the fourth year, during the first half of the scholastic year, spend half a day every week together at the model school, where they pay attention to special methods and model lessons and engage in actual practice in the teacher's presence. In order to acquire the necessary skill in management they visit the model school alternately, one by one, on one or more days, either to observe and listen or to be actively employed. (Soleure.)

In connection with preparations and criticisms on their practice in teaching the senior students are instructed by the teacher of practice schools in the methods of the separate studies of people's schools. After grades and studies have been arranged in the beginning of the first semester, every student must for two or three weeks attend occasional lectures, whereupon his practical studies begin. Grades and studies are changed in the second semester. Preparations are discussed and criticised in their application. The presence of other students at keeping school is compulsory. The teacher of pedagogy devotes an extra hour once a week to the

discussion of the trial lessons and the experiments and observations made at the normal school. (Chur.)

After students of the second year have become acquainted with pedagogical writings during one semester, have studied the subjects of imagination, emotion, and volition in psychology, as well as the methods of different school studies in general, and have made preparations for every branch pursued in the upper grades (fourth to the sixth elementary school year) they are introduced into practical teaching by the instructor of methods. The preparation of a study is assigned to every student, with whom it is then discussed; if considered good, it is carried out in the class room under the teacher's direction. After a student has worked at a branch for five or six weeks a new programme is arranged; the studies are so changed that every student has some practice in the most important branches. In the third grade a similar plan is adopted, the only difference being that students from the beginning are actively employed in teaching at the model school, and as capacity permits, are allowed to teach in primary grades (first to the third school year). (Schiers.)

The practice-school teacher also instructs the students in special methods. From the third (next to the highest) grade on students are required to visit practice schools and conduct trial lessons. On a one-session day of three hours senior students alternately take entire charge of the classes in the teacher's presence, so that they gradually become acquainted with the complete working of schools of eight grades. Discussions are combined with practice. (Wettingen.)

In the first quarter of the third (highest) grade young ladies begin to practice in their own class. From the second quarter on their practice extends to city primary schools, beginning with the lowest grade. The practical exercises are concluded in the divisions of schools of two grades. Men and women teachers assist throughout by giving necessary practical hints. The teacher of pedagogy conducts practice lessons with the young ladies in the different divisions. This is better than the former arrangement, when in one afternoon a large body of children participated in one trial lesson. But normal-school principals do not consider the frequent changing from one division to another and from teacher to teacher the best preparation for teachers. They are endeavoring to arrange a true practice school in connection with the three lowest grades at least. As most women teachers are engaged in primary schools, practice in these grades would be sufficient. (Aarau.)

After the organization of people's schools has been discussed in class the second-grade students, during the second half year, visit practice schools for a day at a time as quiet observers; a minute report of their observations is handed in to the teacher of pedagogy. In summer, just as in winter, students of the third year spend their time in listening and observing, assisting in the correction of written tasks, and after a progressive preparation giving oral instruction in the different branches and grades. They are under the supervision and direction of practice teachers, to whom they hand written preparations, and with whom faults and errors are discussed. A written report of their observations and experiences must be handed to the teacher of pedagogy.

From time to time the whole third grade assists at the instruction of practice teachers in presence of the professor of pedagogy and, as circumstances permit, the observations made are discussed. In winter the different grades of elementary schools assemble once a week at the normal school, the students of which by turns conduct lessons, for which all must prepare. A free criticism follows between directors and pupils. Occasionally other schools are visited. (Kreuzlingen.)

We have as yet no model school; we shall have one next year. (Locarno.)

A professional and practical education is acquired at practice schools. Students of the senior class go there by turns, so as to participate in all the lessons. (Lausanne.)

In the absence of practice schools, those who wish to be teachers have the opportunity several times a year of attending lectures and conducting practice lessons at the primary schools of Sitten. (Sitten.)

Students of the first year (lower grade) devote one hour and those of the second year three hours to practical exercises in the elementary city schools. (Neufchatel.)

Students are practically engaged at model schools, first, as monitors in charge of classes during recreation and walks, as an exercise in disciplining; after that, as assistants under the direction of the presiding teacher; and lastly, as class teachers, preparing their instructions in writing and teaching in the presence of the principal, presiding teacher, and classmates. The lessons are subsequently criticised by all. (Peseux.)

After leaving school young teachers are on probation for an indefinite time. This arrangement of teaching under the direction of a teacher, even after leaving the normal school, prevails also in the Canton of Fribourg. The probationer receives no definite appointment, and in some cases only very small pay. (Regulations of Geneva.)

The normal courses obligatory for students of the first year include all the studies of elementary education (object lessons, language, geography, arithmetic). Practical exercises are combined with the theoretical normal courses. Under their teacher's direction normal-school students teach in the different grades of primary schools, especially language and all its branches, arithmetic, elementary geometry, and geography. (Women teachers of Geneva.)

We have amply considered different models of arrangements for the practical education of teachers, from the modest beginning of occasional attendance at lectures in school to methodical direction and individual exercise in model or practice schools. The difficulty of giving each normal-school student the greatest possible amount of practice still remains.

(c) *Number of lessons per week.*—The total number of lessons per week in the normal schools of Switzerland is very considerable. While the effort to keep the standard of obligatory studies moderately high is perceptible, optional studies are made so attractive that zealous students eager for knowledge, as a rule, devote considerable time to them.

The normal school for women of Geneva has the least number of lessons per week, 25; the normal schools for women of Sitten and Brieg have the most, 46. The lower extreme is an isolated case, and the larger is approached by many other institutions; the average is 38 lessons per week; all others number over 30, and nearly half 40 lessons and more. When we consider that 19 normal schools have optional studies, and employ a large number of specialists, who do not always confine the private tasks of pupils within prudent measure, we must confess that the number of lessons per week for future teachers is uncommonly large, generally even to excess. In revising the courses of study judicious omissions will have to be made.

It is more difficult to reduce the number of studies in normal schools than in other higher educational institutions. When any branch of knowledge has developed into a special study to which a more general significance is attributed, its introduction into normal schools is advocated clamorously. In case any pedagogical thought has made more or less progress in the public consciousness, normal schools are at once called upon for a practical test. Teachers themselves are the most persistent in this, because they preeminently feel the necessity of

continuous improvement in normal-school education. In addition to these outward influences the general difficulties are further aggravated by the persons (specialists and authorities) upon whom such a revision devolves. Each one is so convinced of the great importance of a special branch that he strains every nerve to insure it a correspondingly large amount of time.

All the good genii of youth will have to muster their forces to prevent a heavier burden of lessons, which is more likely to result from revising the course of study than the intended reduction of studies.

## II. BOARDING SCHOOLS.

Twenty-four of the 37 normal schools accommodate boarders. Nine for women, 3 for men, and 1 mixed normal school, 13 in all, do not take boarders. All private normal schools are boarding schools. The dormitories opened in the spring of 1840 at the male normal school of Kussnacht, in Zurich, were closed conditionally in the summer of 1875, and have not since been opened. The male normal school in Locarno has accommodated boarders only since 1889.

Dormitories have an economical as well as educational purpose. Their favorable educational influence on future school-teachers has lately been most emphatically contested. The discipline and seclusion of a convent are not considered an appropriate preparation for the later position of teachers among the people. The characteristics developed by boarding schools are calculated to estrange teachers from the people and the young, and increase the difficulties of their professional practice, whereas continual contact with the world insures self-reliance and preservation from educational prejudices. On the other hand, it is maintained that boarding-school discipline, rather than the enjoyment of unlimited freedom at so young an age, tends to preserve young men from dangerous excesses. The economical side of the question deserves to be the more earnestly considered, as teachers are in Switzerland largely supplied from the lower strata of society, with whom the cost of several years' residence away from home becomes a question of actual existence. By granting sufficient scholarships capable young men can study for the profession of teaching without the necessity of boarding schools. According to experiences in the Canton of Zurich, it would be a mistake to believe that boarding schools are attended with more expense to the State than day schools with increased scholarships. After closing the boarding department of the normal school in Kussnacht the average yearly expenses per pupil did not increase to the anticipated amount (1874, 510 francs; 1875, 550 francs; 1876, 550 francs; 1877, 580 francs; 1878, 570 francs).

The daily routine of boarding schools is nearly everywhere the same. In summer pupils rise at 5 o'clock; in winter at 6. Personal work then begins. Morning prayer and breakfast between 6.30 and 7.30, class work from 7 or 8 to 12, dinner at 12, outdoor work or gymnastics

at 12.30, class from 2 to 5; then afternoon collation, with a short recreation; outdoor work from 7 to 8; then supper, followed by indoor work until 9; evening prayer, and retiring for the night. This is the daily order of the different boarding schools, which is identical with that followed out in all normal schools for men. Where agricultural labor is pursued field and garden work offer an agreeable change of occupation after dinner or evening classes.

In some schools students are obliged to assist in preparing meals, splitting wood, etc., and engage in general housework, as sweeping the rooms, stairs, halls, etc., setting and clearing off the table, caring for the lamps, attending to the stoves, etc. (Hofwyl). In this case a part of the servants' work devolves upon pupils, to keep down expenses. Several normal schools have recently introduced manual training, which will gradually displace the less educational housework.

Boarding is usually compulsory; day students are admitted only where there is lack of room. In Hofwyl senior students live in private boarding houses. In Chur boarding at schools is optional. Present accommodations are hardly sufficient for half of the students; the other half are partly accommodated in boarding houses and partly in the boarding department of the cantonal school.

In the normal school of the Canton of Thurgovie, in Kreuzlingen, a petition of the teachers to make boarding optional was not granted. As a rule a number of pupils live together in study halls and dormitories. At the normal school of the Canton of Aargau, in Wettingen, the room system is carried out; 49 rooms of different sizes are at the pupils' disposal; at present each room is occupied by one or two pupils.

In the normal school of St. Gall the boarding department is managed by a steward; the semiannual boarding fee is regulated by existing prices of food. Every pupil is required to pay 1 franc a year for the use of tableware furnished by the steward at his own expense; breakage must be replaced by the students.

Annual fees for board are generally very small. In the State normal schools of the Canton of Berne the poorest students pay the small amount of 150 to 170 francs. Additional payments, varied according to the wealth of the parents, are required of those better situated; for every 1,000 francs of reversionary or prospective property from 25 to 270 francs is added, which fixes the maximum at between 400 to 420 francs. Most of the payments range between 300 and 400 francs; those nearest to 300 francs predominate.

According to the accounts of the boarding department of the pedagogical section of the cantonal school in Soleure, the amount paid by the State for one student's board in 1889 was 5.50 francs per week. Young teachers, after receiving appointments, must pay back this outlay at the rate of 3 francs per week. (Primary school law of 1873.) This amount does not include the weekly expenses of the State for light, heat, washing, medical attendance, sundry replenishments of

inventory, averaging 1.75 francs per pupil; the total outlay amounts to 7.25 francs per week.

As it is presupposed that pupils spend their vacation at home, the average boarding fee does not exceed 1 franc (20 cents) per day. Some schools board pupils during vacation, but only at an extra charge. As medical attendance and washing are included, the charges of boarding schools are really very moderate. Students from other cantons usually pay higher rates than those born within the limits of the canton. Indigent students are taken free of charge, or the boarding fee is reduced, or scholarships are granted which cover either all or part of the fee.

State normal schools of the Canton of Berne grant scholarships to the amount of 400 francs per student, decreased in proportion to what a student must contribute toward the fee according to his financial condition. About two-thirds to three-fourths of the students pay the least amount, 150 francs, and receive the highest scholarships, 400 francs. Hauterive grants no real scholarships, but for indigent students the fee is reduced from 350 to 200 francs. We learn from Soleure that "scholarships are not necessary, as the State defrays the expenses of residence, board, medical aid, and washing."

The directors of the male normal school in Kreuzlingen sent the following communication:

In the school year of 1890-91, 44 of the 55 students of Thurgovie received scholarships. The lowest State scholarship amounted to 90 francs; the highest, to 200 francs. The synode grants extra scholarships to Catholic students of Thurgovie; 9, ranging between 70 and 100 francs, were given in 1890-91, making the total amount received by each pupil 800 francs. The home cantons grant scholarships to nonresidents of Thurgovie to the amount of 350 francs, out of which the board fee must be paid.

Two examples of menu cards will give an idea of the fare in boarding schools:

*Menu in normal school for men in Kreuzlingen.*—Breakfast (7 o'clock): Oatmeal porridge, with bread; Sundays, coffee and milk, with bread. Dinner: Soup, meat (pudding once), bread and vegetables, a pint of cider or a glass of wine. Afternoon collation (4 o'clock): Coffee and milk, with bread. Supper (7 o'clock): Soup, with bread; Sundays, sausage, cheese, and the like.

*Menu in normal school for men in Locarno.*—Breakfast: Coffee and milk, with bread. Dinner: Soup, meat (200 grams), vegetables, bread, and a glass of wine. Afternoon collation (4 o'clock): Cold meat, sausage, or cheese, with fruit and bread. Supper: Meat soup or milk, with polenta and a glass of wine.

It is surmised that other boarding schools similarly provide sufficient and wholesome food.

### III. TEACHERS.

Normal-school professors are appointed to instruct in a single branch or a few closely allied studies. In small schools the whole burden is borne by a few teachers. Large schools employ specialists for depart-

mental teaching exclusively. In boarding schools teachers and even their families live in the schoolhouse (Wettingen). If unmarried, they eat at the table with the principal or steward. Families occupy dwellings connected with the institution, which obliges them to assist in superintending the students.

In most cases the principal is at the same time superintendent of the dormitories, if not the steward. In this case he and his family enjoy the occupancy of a free dwelling.

The professor's term of office is usually one of six years. That of the principal is sometimes limited to the shorter time of State administrators; in Kussnacht (Zürich), for example, to three years. Shorter terms prevail in Hitzkirch (Lucerne), four, and in Rorschach (St. Gall) two (to be extended to ten years by reelection).

Salaries are either fixed or vary with the number of hours of work. The salaries of a few normal schools are as follows: State normal school of the Canton of Zürich, 3,000 to 5,000 francs;<sup>1</sup> Berne, 2,000 to 3,000 francs; Lucerne, 2,300 to 3,000 francs; Soleure, 2,000 to 3,200 francs; St. Gall, 3,000 to 5,000 francs; Grisons, 2,600 to 3,500 francs; Aargau, 3,200 to 3,500 francs; Thurgovie, 2,400 to 3,600 francs, with additions for age and personal qualifications; Vaud, 3,000 to 4,000 francs.

Remuneration according to the number of lessons per week is still in vogue to some extent on the basis of 100 to 200 francs (in Vaud 100; in Neuchâtel 200) a year per weekly lesson. In the Canton of Geneva salaries thus regulated are so adjusted that 200 francs are paid for the first 10 weekly lessons, 190 for the 10 following, and 170 for every following 10 weekly lessons. The differences are due to the fact that with an increase of lessons the quality of the instruction necessarily deteriorates. In some branches the remuneration exceeds the first payment of 210 francs (history of pedagogy, 225 francs).

The average salaries of private schools are less than those of State normal schools; on the other hand, city schools pay better than State institutions.

The teachers of a normal school form a faculty whose opinion on important educational questions is consulted by supervisory authorities. The unlimited power of the principal, formerly granted to normal-school principals, proved a constant stumbling block in the way of other teachers, whose cooperation for the prosperity of the institution was rarely sought in conducting educational affairs, and this unlimited power has, in most normal schools, been restricted by placing part of the responsibility on the body of teachers.

Sixty-six women teachers are employed in the female normal schools. Women teachers to the number of 33 are exclusively employed in both institutions of teaching sisters in Menzingen (Zug) and Ingenbohl (Schwyz) and in the female normal school in Brieg. All other institu-

<sup>1</sup>For convenience one may calculate 5 francs to be equal to \$1. The exact ratio is 1 franc = 19.3 cents.

tions employ men teachers, too, who, as a rule, form the majority. A few female normal schools engage no other than men teachers (Zurich), or a single woman teacher may be found teaching with a number of men teachers (Berne. Lausanne, Neuchâtel).

#### IV. STUDENTS.

The total number of male and female students at the 36 normal schools in Switzerland is 1,977, of which 1,294 are men and 683 women. Adding the 25 female students of the Froebel Normal School in Neuchâtel, there are 2,002 students of both sexes, men forming about two-thirds, women about one-third of the whole.

The female normal school of Zurich is the only one of its kind with a four year course. The four courses of the "teaching sisters" institutes at Ingenbohl (Schwyz) and Menzingen (Zug) are specially designed for the education of grammar school teachers and applicants for French schools. There are 11 normal schools for men with a four year course. The large institution of Soleure will soon advance into this category. The normal school at Rickenbach (Schwyz) is likewise included, as it has a preparatory course for those candidates whose previous education is faulty, or who have attended no grammar school. More than half of the new entries are of this contingent.

In most institutions students are conditionally admitted upon the results of a test examination. A shorter or longer probation is required for permanent admission. Citizens of the Canton, as a rule, pay no tuition fee, which is required only of foreigners and nonresidents. Where normal schools are only a part of a more extensive school system a moderate tuition fee is demanded (20 to 60 francs a year=\$4 to \$12).

Poor students are assisted with scholarships in most institutions. Zurich occupies the place of honor in this respect. In 1890-91, 118 of 153 pupils received scholarships, amounting to a total of 34,300 francs. The largest individual amounts, 400 and 500 francs, are given in the first and second and third and fourth grades, respectively. The average scholarship amounts to about 300 francs. As the board in private families costs about 12 to 15 francs per week (forty school weeks) the daily support of a student in Kussnacht costs from 500 to 600 francs a year; clothes, books, and school materials require an additional outlay of about 200 to 300 francs. The education of a school-teacher in Zurich consequently costs about 800 francs (or \$160) a year; or for the whole course, at the very lowest calculation, 3,000 francs, while the scholarships granted by the State to indigent pupils amount to 1,800 francs, at the very highest, for the entire course.

Vaud ranks next. Male and female students of both schools in Lausanne are assisted in their daily support by subsidies from the State, which vary from 20 centimes to 1.40 francs per day; the highest yearly scholarship (for three hundred school days) amounts to 420 francs. The

scholarships granted during the year of 1890-91 amounted to 28,702 francs.

As a rule, after having received their diplomas, students thus assisted are obliged to teach a number of years without compensation, or pay back the money advanced. Regulations on this point differ widely, the Cantons of Zurich and Valais being the extremes.

In Zurich pupils who afterwards do not apply themselves to teaching, or resign within ten years after leaving school, are required by law to pay back all advanced amounts. The following arrangement prevails in Valais: Before entering the normal school students pledge themselves to teach eight consecutive years in the Canton, or repay the subsidies received from the State in proportion to the time remaining. Regulations in the other Cantons vary within the above-mentioned limits.

The following statement refers to optional branches, as pursued by normal school students:

|  | Re-<br>ligion. | Ger-<br>man. | French. | English. | Italian. | Latin. | Piano. | Violin. | Organ. |
|--|----------------|--------------|---------|----------|----------|--------|--------|---------|--------|

| Schiers .....                          | .....          | .....        | .....   | .....    | 1        | .....  | 5      | .....   | .....  |
| Aarau .....                            | .....          | .....        | .....   | 7        | 11       | .....  | .....  | .....   | .....  |
| Sitten .....                           | .....          | 40           | .....   | .....    | .....    | .....  | .....  | .....   | 12     |

Where the students are not much restricted they feel, like other young men, the necessity of banding together in societies for mutual benefit. It is good for them to have experience in such affairs. As teachers they can not absolutely refrain from attending meetings of societies. Young teachers whose time is claimed to promote singing, gymnastics, and undertakings for the common benefit neglected by the community, often incur the danger of injuring themselves in trying to do too much for the common welfare. After they have once tasted the pleasure and pain of being a member and an officer of a society they are more circumspect in regard to the outgrowth of social life.

Singing societies have been formed in the normal schools of Unterstrass, Hofwyl, Schiers, and Lausanne; athletic clubs in Kussnacht, Unterstrass, Hofwyl, Rorschach, Schiers, Wettingen, Kreuzlingen, and Lausanne; stenographic unions in Kussnacht, Hitzkirch, Zug, Rorschach, Wettingen, Kreuzlingen, and Lausanne; reading circles in Kussnacht; societies for general purposes in Pruntrut and Peseux.

Where normal schools are a division of cantonal secondary schools, students of the pedagogical section are admitted into existing cantonal school societies (Soleure, Chur). Five hundred and sixty graduates of normal schools obtained the State diploma in 1891; of these, 297 were men and 241 women, and 22 women kindergartners.

## V. EXAMINATIONS FOR MATURITY OR GRADUATION.

Examinations for graduation of elementary-school teachers differ widely in the various cantons. In consideration of the large number and the extent of branches in which examinations are held, several cantons have arranged a timely division so conducted that at the end of the junior year a part of the examinations is completed (Zurich, Berne), or the theoretical examination is finished on leaving the normal school, and the practical is deferred until later (Lucerne, St. Gall); or, finally, the examinations are at once finished and the diploma conferred only on condition of subsequent practical service (Fribourg, Geneva).

The following examples serve as illustrations: In Zurich, after the conclusion of the third year, general and sacred history, history of pedagogy, geography, and grammar are concluded in a preparatory examination; mathematics and natural science are finished in another examination; the other theoretical studies and practical examinations are completed at the end of the senior course. Experience in teaching proves to be beneficial to pupils and secures better results in examination. The two years' probation preceding a definite appointment is designed to supplement the practical preparation.

A similar arrangement exists in the Canton of Berne for the examination of primary-school teachers. The preparatory examination is held a year before the final examination, and embraces the following branches comprised within the limits of the course of study for the first five semesters: Psychology, religion, German, grammar and rhetoric, mathematics, natural science, history, geography, and penmanship. The subjects for the final examination are the branches of the last two semesters in the above-mentioned studies; in addition, pedagogy and methodology, French, drawing, music, and gymnastics, as well as practical ability in teaching and training children.

The Canton of Lucerne gives a conditional certificate for a year, at the end of which pupils must pass another examination to receive the final diploma. The following arrangement prevails in the Canton of Fribourg: If the students have passed the first examination for diploma, the senior students, after leaving the normal school, serve a year's probation under a good instructor who directs them in practical teaching. Superintendents indicate to the public-school board the teacher under whom a probationer is likely to benefit most. After a year's probation the students undergo a second examination, the result of which decides whether a diploma is to be granted.

In St. Gall a conditional certificate is granted on the results of a final normal-school examination. After the lapse of two years, which must be spent in teaching, candidates take the examinations for graduation, which are based upon practical and general education. In Grisons, according to the applicant's accomplishments, diplomas of the first and second degree, accompanied by certificates of admission, are granted,

which permit the recipient to teach. To be eligible admitted teachers must secure a diploma by passing a new examination. The examinations for graduation are held at the close of the normal-school course; the examinations for admission to the profession at the end of a review course.

In Valais likewise a conditional teacher's certificate is given at the close of the normal-school course.

If, at the end of the year, the local school inspector hands in a report expressing satisfaction to the department of education, the candidate in question is allowed to teach four years longer. At the end of this time he is obliged to pass another examination to be permanently appointed as teacher. To comply with these requisitions most teachers, after an absence of five years, return to the normal school for a two-months review, which prepares them for the practical examination.

The Canton of Geneva differs from that of Fribourg in only one point. After receiving the diploma of the pedagogical section of the college, or of the secondary school for women, and devoting the specified time to practical exercise (probation), no second examination is required for permanent appointment, but only a proof of having taught at a primary school.

We find many arrangements directed toward supplementing and broadening the deficient practical preparation the normal schools offer, and preserving the consciousness in young teachers that they can only be successful in the practice of their profession by continually endeavoring to perfect their general scientific and special professional education.

At one normal school a permanent arrangement exists for aiding and promoting self-culture and review, repetition, or continuation courses (Vaud). For the purpose of elevating instruction in certain branches other normal schools from time to time institute regular and, occasionally, obligatory normal courses in methodology, singing, gymnastics, drawing, etc. Attendance is either compulsory or strongly recommended. Participants, as a rule, receive allowances from the State to help defray the increased expenses.

## VI. FINANCIAL CONDITIONS.

(1) *Buildings and grounds.*—The buildings occupied by normal schools are sequestered monasteries (Kussnacht, Pruntrut, Hitzkirch, Rickenbach, Hauterive, Rorschach, Wettingen), still existing monasteries (Ingenbohl, Menzingen, Zug), former inns (Unterstrass), old country seats, or school buildings which serve other educational purposes likewise.

A few examples will illustrate this. The normal school of Kussnacht possesses a main building for classes and the principal's residence, a gymnasium, a practice-school building, and an electric-power house. The accommodations of the normal school for women, in Hindelbank, consist of the parsonage, in which the principal and greater number of pupils live, a school building with gymnasium, hall with class rooms,

and a laundry. Some normal schools for men have large areas of land for agricultural purposes; others have a large garden for recreation and the growing of vegetables (Hofwyl, Delsberg, Muristalden, Rickenbach, Hauterive, Rorschach, Wettingen, and Kreuzlingen).

As a rule, the agricultural department is managed by a skilled agriculturist instead of the normal school principal. The most valuable landed property is controlled by the State normal schools in Hofwyl, Hauterive, Rorschach, Wettingen, and Kreuzlingen.

(2) *Income*.—The income of normal schools is derived from invested property, tuition fees, board, and incidental sources. The income from real estate is generally very small. In boarding schools the income is either expended "in natura" for housekeeping (Hofwyl, Hitzkirch, Rickenbach, etc.), or the produce delivered for general use is rated and noted in the account book under income and expense (Rorschach, Wettingen, Kreuzlingen).

As in most normal schools instruction is gratuitous, the income derived from tuition fees hardly amounts to 30,000 francs for all of the 37 normal schools. Most of this is paid by nonresidents or foreigners. Board, which sometimes includes the tuition fees, amounts to about 160,000 francs for all the 12 boarding schools.

Receipts independent of appropriations granted by the State and communities are limited to contributions of societies and individuals for the benefit of private schools, and amount to about 60,000 francs a year. The total income of the 37 normal schools, not including amounts granted by the State and communities—as far as information goes—amounts to about 250,000 francs, or \$50,000, and does not cover one-fourth of the necessary expenses.

(3) *Expenses*.—An examination of the yearly expenses in connection with normal school education is attended with the greatest difficulties. Normal schools, which are only a division of a more extensive educational system, keep no separate accounts; in most cases, authorities have not even attempted to make the detailed, though not impossible, distinction. Information on this point is therefore inaccurate and incomplete. A few calculations are based upon the author's own estimate attained by a comparison with other information received. The result obtained should not conflict with the actual expenditure, and should be rather less than greater.

An annual sum of 1,000,000 francs is spent on normal school education in Switzerland; with 2,000 students this gives an average of 550 francs (\$110) per student.

Half of this goes toward salaries and one quarter toward the living expenses in boarding schools. It is very gratifying to see that most cantons are ever more willing and generous in extending a helping hand to those students who are zealous but poor. The information received concerning scholarships, though not altogether reliable, states the annual amount thus spent to be above 150,000 francs.

The apparatus at normal schools seems to be generally very simple and inadequate. The expenses for school-room necessities are very low, hardly exceeding the amount of 30,000 francs.

#### CONCLUSION.

The examination of normal schools in Switzerland proves that everywhere diligent and earnest efforts are being made to promote the cause of normal education; that teachers may be qualified in a proportionately short time with the general education and professional knowledge and ability requisite for the practice of their vocation; but that uniformity of action presupposed by the united public does not exist. There are no unifying measures taken. All is individual effort. Strong and progressive institutions do not support those that are weak and backward. These institutions do not even hold free, common council. Teachers at Swiss gymnasia, or secondary schools, meet at least once a year to discuss mooted questions affecting their work. The normal schools of Switzerland are not only separated from the other higher educational institutions in their own canton, but each normal school occupies an isolated position in regard to the others.

It would be quite inadmissible to speak of the necessity of Federal interference in the question of normal school education, though national unity could be thus most effectually promoted [says Grob], but it seems our duty at least to point out the desirability of general intercourse among the normal schools of Switzerland, and express the hope that visiting normal school teachers consider themselves the bearers of a national spirit, and miss no opportunity in their travels throughout the State to preserve old associations and form new ties of feeling and action.

---

#### VIII.—MENTAL FATIGUE IN SCHOOL.

For several years the subject of mental fatigue in secondary schools in Germany has been discussed with much show of ardor, and school authorities in that country have frequently been assailed for expecting too much work of the juvenile brain. Representatives of the science of hygiene, feeling themselves called upon to substantiate these charges, subjected some schools to a rigid test. Leo Burgerstein, of Vienna, and others, notably Professor Hoepfner, of Berlin, were successful in presenting statistical results which were in every way reliable, because scientifically obtained and tabulated. Professor Burgerstein presented his results in the form of a diagram, called the "fatigue curve," before a meeting of the Society of Hygiene in London (1892), and at other places; and Hoepfner published in 1893 a little book in which he presented the results arrived at accompanied with very impressive language. Both gentlemen are practical school men; and their words and figures made a deep impression. Later Professor Kraepelin published a work on the "Limits of mental capacity in youth" (1894), in which he made use of the before-mentioned tests, and added others, reviewing

the question with great erudition from a physiological and psychological standpoint. This attempt to substantiate the statement that the German high schools, both classical and modern, make demands upon the mind, which youth can not live up to without serious injury to health, has naturally created an opposition which deserves to be heard, inasmuch as overpressure has often been said to exist when on various occasions comparisons were instituted in this country between German and American schools. Dr. Gustav Richter, a man of great erudition and practical experience, gives voice to the opposition in an article published under the caption "Instruction and mental fatigue" in "*Lehrproben und Lehrgänge*," Halle, Germany. His arguments are the more acceptable since they are advanced with candor and laudable impartiality. An extract from his article is here inserted. Dr. Richter says:

The opponents of our present school system, ever since Lorinser's famous book appeared, have used the catchword "mental fatigue" as a weighty argument against the organization of the entire system of secondary schools. In numerous pamphlets caused by the fierce educational struggle raging in Germany, evidences for and against this assumed fact have been furnished, and new material, statistical and otherwise, has been published which urged school authorities everywhere to counteract by real or assumed improvements and revisions of the courses of study, the dangerous excess of demands upon the youthful brain. Nevertheless, a solution of the burning question has not yet been reached.

No investigator has been able to state the laws of mental growth in the age of development other than in general lines; nor has anyone been able so clearly and distinctly to define the beginning of fatigue and the statics of mental capacity for the different steps of the juvenile period of development so that schools could derive from them useful regulations for the minutiae of practical work. In reply to Preyer's essay on "Natural Science and School" I have emphasized that no single professional science as such can have the privilege of determining aims and methods of school education, but that only to pedagogy can be given the right to do that, it being the general science of education. But I have acknowledged that pedagogy must listen to other sciences and use them as supplementary sciences. With reference to natural sciences, I said: "They must state the amount of elementary knowledge from the various fields of science necessary for general foundation of higher study. This is a task which, though it may seem simple, is by no means accomplished with unanimity by the representatives of higher education. Second, natural science must give us the conditions and laws of physical development, and, as far as is possible in connection with that, also of psychical development. From this may be derived the right to supervise the schools from a medical standpoint, and to examine with reference to hygiene the buildings and everything appertaining to them.

The first of these two tasks Lothar Meyer has earnestly tried to perform. The second task has recently been tried by Emil Kraepelin, professor of psychiatry in Heidelberg. His work, entitled "Concerning Mental Labor" (Jena, G. Fischer, 1894), is an eminently useful one, because in place of glittering generalities, such as "excessive demands upon the gray substance of the young brain," and "excessive accumulation of knowledge in the undeveloped brain," he offers scientifically gathered facts which represent tests and observations beyond criticism. And yet his conclusions are wrong. How that is possible will be seen if we review his work from the standpoint of experience.

He first investigates the limits of mental capacity in youth. School [he says] makes daily demands for a certain measure of brain work without being convinced that the juvenile brain is able to perform such work without serious injury. We send the ship out upon the open sea without a trial trip, that is to say, without

knowing whether it will be seaworthy. In order to obtain reliable information concerning this we must examine the conditions of fatigue in children.

The author starts out with tests made with adults. He says:

That which we can determine with great accuracy is the working power of the individual in simple mental performances. To measure them we may utilize a number of small tasks of equal difficulty, and problems to be solved within a given time, as, for instance, counting of letters, reading, memorizing rows of numbers, syllables and words, a continuous adding of simple numbers, and similar work. All this work was carefully examined by him, but he only gives us the result obtained in adding numbers. The persons tested were students in the university, assistant professors, young men who were of nearly equal education and age. In exercise books specially prepared for the purpose, the professor made them add without interruption the figures printed. When the sum of one hundred was reached the hundreds were omitted and the addition of units was continued. At intervals of five minutes a signal with the bell was given, and a line was made under the figure added last. When the results were examined, it was found how many numbers in periods of five minutes each person had added. This clearly showed the degree of velocity with which different persons work. This result will be found in every kind of simple action. The difference in individual capacities will plainly show up. This kind of test simply proves the individuality of personal capacity and nothing else.

Common experience has taught us that the performance is greatly influenced by the amount of exercise one has in it. The rapidity in adding will increase with every test, until a certain limit is reached beyond which this velocity can not be increased by exercise.

The extent of capacity for exercise seems to the author to be a general quality of the individual. He who proves himself very capable in gaining skill in any one field of action is apt to increase his velocity in working in other fields. Whether a similar statement can be made with reference to the power gained by exercise has not been investigated sufficiently, but it may be stated that a skill once obtained is not lost very rapidly. After several months the author plainly noticed the skill gained by the exercises in addition mentioned before, though they had lasted only a few hours.

Professor Kraepelin has also discussed fatigue. According to the views of modern physiology, fatigue is a chemical process in the organic cells. The working muscle secretes waste material, which is poisonous. The stronger the brain activity, the more copious is this secretion of the brain cells. Their environments are contaminated, the poison gets into the blood and through the circulatory organs it comes in contact with the nerves and cells of other parts of the body. With the aid of oxygen it is consumed in the blood or destroyed by the liver, or discarded through the kidneys. When this decayed matter accumulates in the blood we feel fatigued; if we exceed the physiological limits we become diseased (compare Mosso's "Fatigue"); but there seem to be also psychic factors in the process of fatigue for which a physiological explanation is difficult.

The progressive increase in the capacity for work through exercise is opposed by the effects of fatigue, which progress much faster. Fatigue everywhere causes a decrease in the amount of work performed, although this decrease may be equalized for a time by increasing skill. As soon as fatigue takes the upper hand the capacity for work vanishes quickly and incessantly.

The author further points to the differences in the fatigue limit of individuals and shows that nevertheless all persons, aside from special well-founded irregularities, exhibit in all kinds of work a similar process in harmony with the given individuality; hence arises the fact of the extent of individual endurance. This is the fundamental quality of each individual, and it determines in general the capacity for work.

Aside from the general state as to fatigue, there are other elements that seem to be open to determination by measure. Thus, for instance, the fixation of the degree of diversion to which a person is subject; the elasticity of his capacity for work, that is to say, the power to equalize disturbances; the dependence of mental power of work upon the amount of nourishment, the duration of sleep or physical exertion. Finally, as a supplement to the measurements of velocity, must be considered the investigations concerning the value of work, which will be exceedingly difficult. At any rate the author has demonstrated that it is actually possible "to express important peculiarities of a mental personality in numbers and comparative ratios."

Yet, after all, it appears to me [says Professor Richter] as though in the methods of investigation applied the measurement of the fatigue limit can not be determined with the same accuracy with which the extent of capacity of exercise or skill can be determined. Mental fatigue is not only dependent upon the performance of work, but also upon accompanying conditions of the emotions. It is a well-known psychological fact that feelings of displeasure will facilitate fatigue, while feelings of pleasure will check it. The inner relation of the individual to the work he is performing is a factor which must be considered in investigating his fatigue limit. The author has not entered into that side of the question, and hence the results of his investigation can not have a convincing character. To add continuously for several hours numbers of a single digit is such a tedious work that it generates a feeling of displeasure which will facilitate fatigue and injure the elasticity of the mind. It must be deplored that the persons examined by Professor Kraepelin were only tested with reference to their velocity in working, not to the correctness of their work; only with reference to the extent, not to the value of the work. It is true the mathematical fixing of the part which interest has in the work will meet with insurmountable obstacles. Mental life consists of such complex processes that every attempt at a mechanical explanation must be stamped at once as inadequate. If the author had given to the persons to be examined a number of interesting problems from their own field of labor, which would, of course, have prevented the test in velocity, he would doubtless have come to other results in reference to the phenomena of fatigue. Moreover, the success each person attained would have changed the entire result in many ways.

In discussing the fatigue of school children the author refers to investigations of practical schoolmen, the results of which have been published in recent years. Leo Burgerstein, in Vienna, placed four rows of simple arithmetical problems before the pupils who were familiar with their solution. Each period of ten minutes of written work was followed by a recess of five minutes. These problems or tasks he submitted to 162 children, in the age between 11 and 13, at the beginning of a school day. During the intervals of recess new blanks containing the problems were distributed, and at the tap of the bell the pupils again went to work, and so on through the morning session. The performance was measured with reference to its amount by the number of problems solved in each period of ten minutes, and the value of the performance was measured by the absence of mistakes. He

was careful, also, to consider the corrections which the children had made during the work.

The result shows that the number of digits used had increased from period to period, demonstrating thereby a considerable average increase in the velocity of work. This increase, however, was made by only 92 pupils, while 70 lagged behind.

The increased velocity is accompanied by an increased number of errors. This, again, is true only with reference to those who progressed rapidly in speed, while those who lagged behind showed relatively fewer errors. The following table shows the general results:

| Periods of 10 minutes. | Digits worked with (about). | Number of mistakes. | Mistakes in per cent of digits. | Mistakes in per cent (about). |
|------------------------|-----------------------------|---------------------|---------------------------------|-------------------------------|
| 1. ....                | 28, 200                     | 851                 | 3.01                            | 3                             |
| 2. ....                | 32, 500                     | 1, 292              | 3.98                            | 4                             |
| 3. ....                | 35, 400                     | 2, 011              | 5.67                            | 5.7                           |
| 4. ....                | 39, 500                     | 2, 360              | 5.98                            | 6                             |

The small increase in the number of errors between groups 3 and 4 is remarkable. It seems as though the children had unconsciously meant to rest in order to start anew in the fourth period. With the rapid increase in the number of errors is noticed an increasing number of corrections. The fewest corrections are made in the third period. Fewer corrections and a greater increase in the number of errors are undoubted evidences of mental fatigue.

Similar observations were made by Hoepfner in Berlin when investigating the work of 9-year-old boys written from dictation. They had been occupied with 19 sentences for nearly two hours, and the work had been careful and slow. In this case, also, the number of errors, which were at first small, increased rapidly toward the end of the work. Computed on the basis of 100 letters, the errors increased from 0.9 to over 6.4 per cent. Kraepelin refers again to the tests in addition to which he had submitted his students and assistant professors, and he states that each thirty minutes of work was followed by a recess of ten minutes. It was noticeable that the work after each pause was more rapid than in the preceding period. He explains this fact by the influence which practice has in generating skill, and by the fact that fatigue is counteracted during the pause of rest. Fatigue disappears comparatively quickly, while the gain in skill remains, and can be noticed for a long time after.

From this we may derive a lesson and a valuable principle for practice in the school-room; it is that by inserting short pauses between periods of work the power is increased and the destructive effect of fatigue is counteracted; the gain in form of skill is very great, whereas skill might be destroyed if the pauses were not inserted. Hence Kraepelin demands more frequent pauses, and he claims that it would be wise to increase them in length as the school session proceeds.

I shall return to this point; and at present quote the author, who thinks he is accurately sketching the condition of school children during instruction. The picture he presents is, according to his own expression, a frightful one:

Since it is demonstrated [says Kraepelin] that 12-year-old pupils show the first signs of fatigue after a period of ten minutes in simple work, it stands to reason that mental work lasting through several hours, only broken into by brief periods of rest, must inevitably lead to complete mental exhaustion. The intensity of attention

demand is much too great. The pauses of rest are much too short, and a normal capacity for work can not be maintained under such circumstances. After the first hour of that kind of work the pupil will be in a narcosis of fatigue which makes him incapable of applying his strength to understand and follow the instruction. It stands to reason that this condition shows variations in different pupils and ages. The younger ones are, as a rule, so tired after the first hour that the powerful influence of exercise and skill gained are not able to counterbalance the progressive decrease in the capacity for work.

Not without amusement one reads what the author adds to this picture in gray upon a gray background: "But I freely confess that the picture is painted in colors too dark. As I have described it, the situation would be correct if school accomplished what it attempts. However, kind nature has given our growing generation a safety valve, the value of which can scarcely be gauged too high; it is that of inattention. Only with force, and even then for a very short period of time, can we succeed in securing the attention of our pupils upon the solution of problems given them. Nowhere is there a school in which a whole session can be considered a session of work. Burgerstein, it is true, believed that the inserted pauses would secure a proper relation between effort and recreation in any regular school hour. Yet his tests prove incontrovertibly that our youth would necessarily incur mental disease if they were forced to work steadily and with intense attention for forty minutes of every hour of the school day. That comparatively few are seriously injured mentally by overexertion in school is owing to those branches, and likewise to those teachers, that give to the pupil the blessed opportunity to loosen the reins of his fatigued attention and to forget himself. "We can force pupils to sit still," says Burgerstein, "but we must not deceive ourselves, for in many cases they will rest mentally or rest by obtaining a change of mental occupation and not follow the course of instruction when they are tired. From this the unexpected conclusion is derived that tedious teachers, so-called preaching teachers, have become a necessity. If all teachers understood how to awaken intense interest for their subject of instruction and how to keep it awake, the children would, despite rapidly growing fatigue be led to ever increasing efforts, the consequences of which could scarcely be gauged."

So, then, inattentive pupils and tedious teachers are the necessary contrivances to break the speed of the rapidly running school machine. This is a contradiction of ideas that borders on nonsense: A school is the better, the worse it is.

However, joking aside, there is a grain of truth in this paradox. There are teachers who with iron energy hold the attention of their pupils in such tension that for other branches, especially during the lessons immediately following those of the energetic teacher, the pupils are absolutely unfit for work and consider it a blessing when the teacher lays fewer or no claims upon their strength. And among the inadequacy of all human institutions the school of the future, like the present, will suffer from human imperfection, and will be grateful if nature in her kindness will equalize in her own inimitable way the errors of poor mortals. However, that is neither here nor there. Above all we must find out whether the conclusions of the author are unobjectionable. They start from facts experimentally secured. Have these conclusions convincing power?

We need not appeal to human imperfection. It can be shown that the conclusions of Professor Kraepelin are erroneous, because they start from wrong premises. If in a pupil 12 years old, after a simple kind of work of barely fifteen minutes' duration, the first signs of fatigue are noticed, a continuation of that work, broken into by brief pauses only, would lead to utter exhaustion. To this conclusion leads the presupposition that a single form of written work entered upon with well-defined intention (for instance, that of examining the mental capacity) may be taken for, or confounded with, the general term instruction. In this lies the key to the erroneous conclusion. The author evidently presupposes that the organization and pur-

pose of school claim that the children be kept at the same tension all through the hours of the school day in which they had been kept during the trial lesson, which consisted of test work and mechanical repetition of processes. If this supposition were correct—that is, if these tests were really a photograph of the general working of school instruction—the author's conclusions might be considered sound, for lessons of that kind have all the characteristics the uniform effect of which is a deadening pressure upon the juvenile brain. Let us try to define these characteristics.

It is plain, first, that test work such as was described will hold the thoughts of the pupil exactly in one direction. The same nerve currents, the same ganglia cells are kept in uninterrupted activity. This is the cause why nothing is so fatiguing as uniform mental exertion. Second, such work forces all the pupils simultaneously to the same degree of exertion. The pressure is a constant one, acting upon all alike. Finally, the work obliges the pupils, during the entire time it takes to perform it, to a certain position of the body, which increases fatigue. It is quite obvious that the enforced uniform position of the body necessitates one-sided exertion of certain groups of muscles, while others are kept idle. Feelings of displeasure are generated thereby, which check the activity of the brain.

However, the real average condition of the process of teaching and learning in school, if conducted by a reasonable teacher, is very different. Certainly school demands the attention and participation of the pupil during the whole school day. But as the direction of the instruction within each branch changes frequently, the degree of mental tension it claims for the pupil's activity varies greatly.

Burgerstein makes the same mistake with reference to his test work when he says: "During the time of instruction every participant should, as it was done here, be occupied constantly."

Professor Uhlig, in reviewing Kraepelin's volume, remarks: "I do not in the least doubt the exactness of these tests, but I claim that it is erroneous to draw the conclusions which the author publishes, for these experiments placed the children before a whole series of tasks in the same field of action, the doing of which required a specially high degree of attention. Now, it would be erroneous to assert that the practice in school throughout is analogous to this procedure, or that it should be analogous. If every lesson of the day should demand so high a degree of tension as these test lessons did, school, as it is now conducted, would be subject to the accusation of the most frightful waste of time. No school works constantly in the manner indicated."

The beneficial influence of change upon mental activity is a fact to which the school pays a good deal of attention, both with reference to the order in which the branches follow in the time-table and with reference to the method of teaching within each single lesson. Every instruction following correct methodical principles will show variations in the mental tension demanded of the pupil, according to the amount of self-activity or passive acceptance of knowledge required. There is also a variation of the mental activity depended upon or caused by the different objects in view; that is to say, whether lessons are given in which natural objects are viewed or accomplishments—such as drawing, singing, writing, and the like—are practiced, or whether intense thinking is required, as in arithmetic. It can not be tolerated to occupy the children with grammar or mental arithmetic for hours at a time. A teacher who does such a thing is breeding mischief and should be severely reprimanded.

Every lesson in itself offers a great many opportunities for change in mental activity. The processes of apperception and abstraction, exercise and application of which each claims a different psychical activity, change places very frequently. It is well to emphasize this. In language lessons a poem or a piece in the reader is treated. First, a brief review is held by appropriate questions; then the piece is explained with reference to contents and form. The progress of the action or the development of the thought is followed. Finally comes the exercise in expressive

reading. The different psychical actions are alternately at work. Now it is judgment, another time it is the power of apperception, and again it may be a play of emotions. This constant change prevents fatigue.

During a lesson in foreign languages translation from and into the language takes place; sentences and paragraphs are read; the linguistic form is analyzed; the thought is fixed; the recasting of a thought in the other language is attempted; contents are explained; grammatical exercises take place, alternating with forming and re-forming of sentences; the etymology is studied, and the practice of rules takes place, etc. All these things cause constant changes in the mental activity of the pupil, which prevent fatigue. History, geography, and nature studies offer the greatest variety, both with reference to the matter and method. Even abstract mathematics claims a variety of changes by seeking points of contact with sense perception, and hence permits many pauses of rest from mental tension. Moreover, there are various modes of presenting and solving problems, all of which cause variety.

It is admitted that the pupil can not be spared earnest mental work; but that it should be in the nature of our educational aim that its work must necessarily lead to exhaustion can be positively denied. Sound common sense and the rules of didactics protect the pupil sufficiently. Herbart says: "When the pupil is really fatigued by, not merely being displeased with, certain subjects it is well, as far as possible, to let this feeling subside or be counteracted before the same subjects are taken up again in a somewhat different form." Mosso expresses himself in a similar manner, saying: "The best teachers are those who never overexert one region of the brain of their pupils and who understand the art of attracting the attention, now here, now there, so that it may after awhile with new vigor return to the subject at issue."

Upon such application of method depends the refreshing, revivifying effect of good school instruction. There is recreation in change. If proper pauses for rest are arranged, and if these pauses are spent in the open air, while the schoolrooms are thoroughly aired by opening the windows, and if gymnastics and games are provided for, I really do not know what more could be offered to the growing generation both in regard to physical and mental development. Fatigue taking place after protracted tension can be removed by the two chief remedies which are found in change in occupation and complete recreation. This balance would be much more effective if school had only to deal with healthy children; but we must consider the many weak children who suffer from poverty of the blood and who do not during their school years receive proper nourishment, nor get sufficient sleep, nor enough of other important agencies for hygienic development. It can not be doubted that the school in many cases remedies the errors made at home. The healthful discipline which accustoms the children to regular mental activity, the proper change between work and recreation, the habitation in well aired and lighted rooms, bodily exercise and movement by means of gymnastics and play, as well as in school excursions, a habit acquired in obedience, order, punctuality, and cleanliness are for many children a deliverance from destruction and ruin.

Professor Richter then goes on to quote figures obtained from test work to which the pupils of the gymnasium in Jena were subjected; they are very interesting, and their value is great owing to the scientific method pursued in obtaining the results; but they are omitted here because they essentially repeat what has been said before.

A few words concerning hygienic school statistics may conclude the chapter. Prof. Otto Jäger, in Cologne, in reviewing Kraepelin's and Erb's books, says, that in an experience of forty years both in small and extensive educational institutions he had very rarely found nervous-

ness among the school diseases. He could, if called upon, draw up a counter-bill of cases in which the nervous system of spoiled mother's sons had greatly improved as soon as they had been required to live a regular school life. "Say what you will, and take it all in all, the life within a large public school is on an average a very healthy life."

The drawing up of such an account, to which doubtless other educators could add contributions, would be a very meritorious undertaking. The observations made on nervous children would be supported by numbers far inferior to those of healthy children. It is true, we have not as yet a thorough science of school statistics, but various attempts may be quoted. Prof. Axel Key, of Stockholm, states in his school-hygienic investigations (1889) that in Sweden the children in the upper grades of the common school had fourteen hours of daily work. Thirty-six per cent of the girls are chlorotic, and about 10 per cent of them suffer from spinal curvature. Aside from nearsightedness he found in the schools of Sweden and Denmark that nearly 40 per cent of the children suffered from chronic diseases. This exhaustion and wasting away of strength among the children he ascribes to overtaxing, to the enormous amount of school tasks with which they are burdened. The school physician and professor of hygiene in Budapest, Dr. Heinrich Schuschny, says in a recently published pamphlet entitled "Concerning the nervosity of school children," that in a certain institution which he names, 46.4 per cent of the pupils in the four lower grades suffered from symptoms of nervousness, and that this proportion rose to 57 per cent in the four upper grades. Still more unfavorable is the result of the observations of Professor Nesteroff, in Moscow, who for four years observed 216 students of the gymnasium of that city. He noticed that the proportion of pupils suffering from nervous ailments rose from 8 per cent in the preparatory grades to 67 per cent in the highest of eight grades.

Now, how shall such figures be judged? A few hints are given us by Professor Schuschny. A great proportion of the pupils examined belonged to the Jewish population, who, according to the author and the verdict of medical specialists, are overburdened and oppressed. I can not judge whether this is true, but from further explanations of the author I judge that a large number of these pupils belonged to the poorer strata, who are early in life forced into occupations for the purpose of winning their daily bread.

Often the pupils could only make their attendance in school possible by giving private lessons to little boys; several of them had to support parents. There are in our school students who give private lessons for three or four hours a day; others are obliged to help their parents in stores and shops; one student has to rise at 4.30 o'clock in the morning in order to aid his uncle.

Another hint refers to the intimate relation between the use of stimulants and nervousness.

Of our students 47.7 per cent use alcoholic beverages at home, mostly wine. I found that the greater number of these students suffered from nervous symptoms.

Their proportion to those students who use alcoholic beverages but do not suffer from nervous symptoms is 56.8 to 43.1 per cent, an obvious proof of the influence of alcohol upon the nervous system.

It is to be regretted that a statement concerning the amount of alcoholic beverages consumed at home can not be taken into consideration. It would likewise be important to obtain statistics on the influence of nicotine upon the nervous system of schoolboys. I can bear witness to that influence by stating that a senior student twice declared that he had been obliged to be absent from school because he had temporarily poisoned himself with nicotine through cigarette smoking. Investigation at home proved the correctness of the statement, and the advice given to the parents, either to forbid or to limit the enjoyment of cigarettes (the school as such can only forbid smoking in public), was successful only in one of the two cases. Schuschny inquired into the duration of sleep of his pupils, and found that among nervous children it was too short. He does not mention the nature and quantity of their food, although concerning this point very interesting facts might be gathered. The time after school hours and on holidays is not spent in the most advantageous way.

Is there to-day a pupil of a high school who has not at least once in his life seen a Parisian drama on the stage in which adultery is the chief motive, and then think of the books and modern newspapers. Very few parents attend to the physical development of their children; few ever take their children out for a walk in the open air and into the woods. A diminishingly small fraction of our school boys and girls make use of the skating pond in winter or the swimming school in summer.

I have quoted these statements of Schuschny's, although they have no reference to German conditions, in order to indicate what difficulties are in the way of a proper estimate of statistical material; and what a want of logic it betrays if physical disturbances in children are without hesitancy attributed to the influence of school life. Mosso declares this in his investigations as an absolutely insurmountable difficulty, so that we can not say how many of the boys might be healthy and how many might be ill, if they did not go to school at all.

Schuschny mentions, among the causes of overtaxing, the fact that in Hungarian secondary schools the departmental system of teaching is in general vogue. According to this every branch of instruction is assigned to a specialist, hence in a school of nine grades we may find as many as 11 teachers changing places within a single school day in a single class room. The physician makes some very pointed remarks concerning this.

This system frustrates the educative efforts of school. In Germany every teacher has to teach a group of relative branches, and in every room a class teacher, who has charge of the discipline and attendance roll, has the largest number of hours per week to teach in that class room. In Bavaria the class teacher teaches everything save mathematics and natural science. To the class teacher is assigned the duty

of keeping in constant contact with his collaborators, so as to secure an organic unity of class instruction and prevent the accumulation of home lessons. Specialists always have the aspiration to magnify their branches and demand a degree of attention and interest which can not be maintained uniformly all through the day unless a class teacher restricts these demands to their proper limits. .

In regard to this system we have no statistics, and all our arguments are based on individual experience, the whole tenor of which, however, is so obviously convincing that there can be no doubt as to one thing, namely, that the system of specializing will foster special talents in a few robust thinkers and mentally dwarf the great majority of average talents.

The introduction of well planned and regularly compiled school hygienic statistics is not only desirable, but a requisite of the school of the future. The science of statistics thus properly supplemented will, to a more satisfactory degree than hitherto, influence the various conditions of the growing generation. It will investigate the physical status of the pupils, and thus offer the material for investigation concerning the reciprocal relation of life in school and life in the family. Not until then will the troublesome question of overtaxing the brain be solved in a scientific way. Any State that would begin with obtaining such statistics would deserve great credit. I suggest a few important points: The Government should appoint a commission consisting of physicians and educators and assisted by executive officers. In this commission should be an expert in hygiene and psychiatry (if possible, he should be a university professor), several practical educators, and the State school commissioner—the latter should be the president. This commission should be charged with preparing schedules of inquiry, formulas, and blanks to be filled out. The statistical data gained from these local census returns would have to be not only counted, but also weighed in the light of (*a*) the climatic and geographic location of the city; (*b*) the architecture of the schoolhouse, together with its hygienic condition; (*c*) attendance; (*d*) the number of hours per day and week, recesses, and other things. The foundation of hygienic statistics would be the medical examination of all pupils at the time of their admission to the school. These data should remain in the hands of a physician, and should have reference to weight, size, digestion, pulse curve, blood pressure, diseases passed through, abnormalities, and similar things, about which a professional man can best judge. Georg Hirth remarks justly that it is a mistake to merely give the age of pupils and not also their condition of health medically certified. For newly admitted children a record should be established, and at least an annual examination should take place, which would periodically add items, and thus show a rate of progress or deterioration. Side by side with these general data each pupil should have a column of his own in the record, which might contain items concerning his nourishment, sleep, condition

of place for work and for sleep; that is to say, the amount of light, heat, etc. And it would seem very desirable to note down in what manner the children fill out the pauses between lessons and sessions. Not until a uniformity of execution of such statistical investigations is secured will it be possible to judge properly the question of physical and mental development of youth; and not until then shall we be able to decide the weighty question of overtaxing the brain.

Some may say that these are plans for the millennium. That may be, but if only a few States, small though they be, carry these plans into execution, their results will give a standard measure for other schools and countries. The German nation has at all times had the duty of performing mental work to a higher degree than others, being, as it were, placed in the geographical center of a continent and endangered from all sides, and having to undergo a competitive struggle with all the nations of the civilized world. Without great effort in mental labor youth can not be instructed successfully, and certainly can not be accustomed to prolonged effort unless it is done while the natural powers are still plastic. By lowering the demands and yielding to the complaints of weaklings the process of degeneration will be accelerated and the whole nation will gradually sink to a lower level of culture.

One thing is plain without any statistics. The more readily the life of the nation and the customs of the people return to simplicity, modesty, and inner health the easier it will be for the school to train a healthy race. And again, only when the trainers of the youth are what the young generation is to be will their work be successful. Now, the trainers of youth, however, are not merely the teachers in school, but every one whose example is before the youthful eye, and chief among them that of the parents. Hence every one must begin with himself. Self-control and self-education of the adult are the best discipline of youth. If we only preach and leave to others to do the work, we shall not succeed in warding off the beginning of degeneration, unless frightful catastrophes come to our aid.

---

#### IX. NATIONAL FEATURES OF FEMALE EDUCATION.

By Prof. STEPHAN WAETZOLDT, councilor of education in Magdeburg, Germany.

[Published in the official organ of the Prussian minister of public instruction.]

The science of education has only recently begun to sever itself from speculative theories and turn toward historic development of the momenta that constitute it. There is still too much system and theoretical construction, while unbiased observation and fixation of facts are not as frequently found as desirable. Rarely are the forms of the education of a time or of a country viewed in connection with the entire development of the people. Comparative pedagogy is still in its infancy. The questions, How does a nation, an era, a society arrive at

a particular form of education? and, Why is it a historically necessary result? present themselves to us.

He who has accustomed himself to understand historically that which exists in the education of our people, and compares it with the work and the results of other nations upon similar lines, will not be apt to believe in the possibility or utility of direct copies and adaptations, he will try to understand and to explain, but will refrain from copying; for in the end every nation finds that which is best adapted to its needs, and finds it in its own way.

Such considerations crowd themselves upon us when we view the education of women of our era, when we try to find the ways it is to go and the aims it is to seek. May I be permitted to suggest a few characteristic features of woman's education as found in nations akin to ours? Let us not forget that the most pressing necessity is not found in universities for women, nor in the participation of women in the scientific labor of the times, nor in the opening of higher professions for women, but in the care and extensive education of the millions of girls, indeed, for the education of the mothers of the coming generations. The graceful structures of a higher education and the capstone of the edifice will remain insecure until they can rest upon the broad and secure foundation of a general education of the people. A State which neglects this and promotes higher education exclusively works for show, and neglects the general weal of the people while it may satisfy the desires and claims of a noisy minority. Let us not forget that more important than the results of intellectual education, which are easily recognized and estimated, are the ethical effects of education which are taken into life and manifest themselves as determination of the will, a quality which is not easily estimated, because not visible to the eye.

Some uniform historical features of woman's education are found in the nations of the Occident; thus, for instance, in the early Middle Ages the beginning of higher education was more frequently found among the women of the nobility than among the men. At that time there was no appreciable difference between the intellectual education of women and men. At the close of the Middle Ages, Vives lamented the fact that the female sex was almost everywhere excluded from intellectual light. In the epoch of the birth of the modern state and the modern man, in the era of the Renaissance, there came up in France, in Italy, and in Germany the question of female education simultaneously with the consciousness of personal rights and duties. The Reformation then separated, as it were, the two worlds, and created two kinds of culture, the Germanic Protestant and the Romanic Catholic. Female education in the Romanic countries remained in the hands of the church and within the walls of convents, while in Germanic countries it was extended and liberated by the influences of Protestantism.

Once more the civilized world of western Europe was stirred up by a current of new ideas during the era of enlightenment and humanity. In pamphlets, profound books, romances, and comedies theorizing was indulged in concerning the education of women; it was considered a purely human education. Even the poet Jean Paul thinks the woman happy because she alone, without reference to the demands of a profession or an occupation, could indulge in educating herself to pure humanity. There seemed to be no need for any special education for her. Necessity, the great specter, did not, as yet, knock at her door. But at about the middle of this century the problem of finding occupation for women outside of the family arose simultaneously in all industrial states, and with it arose the necessity for special preparation for distinct professions, which necessity was derived from the ever-increasing difficulties of the hard battle of life. The machine had actually taken the work out of the hands of the women; the number of single women without occupation grew rapidly, especially in the middle strata of the people. Hence the problem of woman's education became of general interest to society and the state. Meanwhile, in the Atlantic States of the New World a type of women, psychically foreign to the Old World, has been formed, a new ideal of womanhood and woman's occupation. The American woman appears on the stage.

Every nation and every era entertains an ideal of the woman according to which it intends to educate the girls. This ideal may change, but it bears abiding national features. Poets sketch it, and in writings on woman's education it is reflected. In France this ideal consisted for a long time in the "*honnête femme*," in the sense of Molière; this gradually changed to the "*femme du monde*," meaning the word in an acceptable sense; finally this ideal assumed the features of the "*citoyenne*." In England the type of the wife of a country gentleman or a clergyman, that is of the gentle lady seems to have predominated. In Germany the ideal bears the dear features of a pious, good "*haus-frau*," which the shy, demure maiden is to take as her model. These ideal pictures are becoming dim in outline everywhere. Something new is wanted. Shall it be the "*femme savante*"? We are aware of the fact that the aforementioned types are those of the women of middle and well-to-do classes. It was much later that consideration was bestowed upon the children of the people—that is, the daughters of peasants, workingmen, and skilled laborers. Only one State has the proud satisfaction of having done so very early, and that is Prussia.

Woman's education in France, as in all other Romanic countries, was determined exclusively by the views of the church, both with reference to contents and form. Only at a very late period and, as it were, in leaps the development of public girls' schools took place. Up to the Revolution (1789) France had no elementary schools for girls. The duty of the State to take care of the education of girls was first recognized in a bill advocated by Talleyrand in the year 1791. That

bill provided that schools should be established for cases in which the education of girls in the family was found impossible or inadequate, and it was based on the principle that girls should be trained for the family and in the family. The idea of schools for girls returned to the surface under Condorcet. He demanded that up to a certain age instruction should be given to both boys and girls simultaneously; hence I believe I have found in his plan the beginning of the idea expressed in America by the term coeducation. Neither Condorcet's plan nor Lakanal's law of the year 1794, which resulted from that plan, was ever realized. The Republic, it is true, had passed the law, but it had not the teachers to execute it. In the great Napoleonic system of a university of France, which embraced all public institutions of learning in the land, woman's education found no place. When, in 1793, the liberty of instruction had been proclaimed, girls' education passed over into the hands of the clergy and private boarding schools, which were managed according to the views of Madam Campan. Even to-day the French rural population prefers girls' elementary schools taught and managed by nuns or "sisters," and for daughters of the highest strata of society convent education is considered the only correct education. From this arises, in France and in other Romanic countries, a peculiar contrast between the views of the world as held by the men and the women of the same nation, while with Germans and the English people in the most extensive strata the education of both sexes is essentially the same (girls and boys in the villages attend the same school, have the same teachers, and are taught according to the same principles and the same course of study); in France the two sexes are actually, by means of education, led to different religious and political views and principles. To close this gap it was thought to educate the girls above all to a "citoyenne," but the new laws, in operation since 1872, have not been able to accomplish that as yet. Elementary education for girls was first secured thirty years ago by Guizot and Duruy. The important organic elementary school laws of 1882 and 1886 are intended to result in a new condition of things; they are hastening the development of the system and are intended to lay a firm foundation. According to these laws every community with more than 400 inhabitants is obliged to establish a girls' school. Except in small villages and settlements, all instruction of girls is reserved for women teachers. It is characteristic that the organization of general elementary instruction of girls under the Third Republic took place later than the legal organization of secondary schools for girls, but both were undertaken with outspoken political tendency and consciousness of definitely breaking with the views of the past.

Also in the field of secondary education for girls the fundamental legislative ideas are traced back to the greatest of ministers of instruction France ever had, M. Duruy. The law of Camille Sée, of December, 1880, then created the *Lycee de Jeunes Filles* upon democratic and

atheistic foundation, and with a strong leaning toward the institutions of higher boys' schools; but at present the desire is felt to bestow more attention upon the feminine qualities of the students, or, as the technical term has it in France, to "feminize the programmes." The system of public schools for girls in France has not grown up from below in its own organic development, it has not assumed forms caused by the changing needs of the time, but it is, so to speak, a construction from the idea; the idea rules reality. The admirably clear, consistent structure of the entire system is decidedly French. French also are the management, the detailed courses of study which go into infinitesimal minutiae, rules, and regulations. The logical consequences from a realization of the plan were drawn regardless of historic facts. To the women teachers were opened the same institutions for professional preparation that were open to men; under presuppositions of equality the women were admitted to the State examinations; the admission of women to university studies was facilitated; higher normal schools for women teachers intending to teach in secondary schools were established. In the same measure, however, in which woman's education in France entered the arena of public education the girls found themselves exposed unsparingly to the customary contention caused by ambition for prizes, diplomas, scholarships, etc. Competition and rivalry in examinations increased. The human being who is that by the grace of examinations only is now being bred and trained in girls' schools of France also; the external success has become an essential motive, and the easily teachable mediocrity wins the victory. Outside of large cities this new girls' school of France finds little support. Church, family, and the people's instinct conduct a secret war against it with zeal and vigor. Let us not be blind to the fact that in judging the effect of the whole system the metropolitan institutions and results are not the proper standard.

To sum up, modern France, in accordance with the tendency of the national spirit, which leans toward logical construction, built up its system of female education rather more in obedience to an idea than to pressing needs.

Quite different was the way England proceeded. England is the classical land of historical forms, of vigorous individuality, of creative associations, of self-government and self-administration, the land of practical purposes. Education in England is supported by the family, the church, corporations, and school communities. The State, as such, participates in the management of the school system directly only in one way, namely, as money spender. The State establishes and manages no schools; it merely supports them and controls the expenditures. A difference in principle regarding contents and form has never in England existed between the education of boys and girls. Since the ancient languages and mathematics are considered to this day as decisive studies in the two ancient universities, Cambridge and Oxford,

the young English women of necessity turn in the same direction. Of necessity also the preparatory school below the university teaches these branches, in the study of which the girls participate.

Up to the fifth decade of our century England owed its systematic efforts in behalf of public education for the children of the people to two denominational corporations. It is a peculiar but very evident fact that the great Church Reformation in England did not exercise the same advantageous influence upon public education that it had done in Germany. Its influence was felt more in the higher strata, and not as with us among the real people. In Scotland, on the other hand, where under Knox the Reformation penetrated all classes of society, there developed a general parochial school system, which elevated the Scotch elementary schools far above those of England. In England the State showed sympathy for the condition and instruction of the children of laborers for the first time in the forties by passing factory laws. Lord Cranborne expressed the opinion in the House of Commons that it was better for children to work in factories than to learn all sorts of useless trash in poorly ventilated schoolrooms. This was the time when Parliament made the first appropriation for school buildings and created a royal school authority, which had power to appoint inspectors, whose duty it was to watch over the expenditures of the appropriations, which were not regular but provisional. This money was distributed, and is to this day distributed, according to a badly reputed system of payment by results. Normal schools for the professional preparation of teachers were and are now very inadequate in number and extent. The so-called monitorial system in vogue in Lancaster's schools was generally adopted, and has been replaced by a system of pupil teachers, which is in use to the present day. All schools were private or church schools. Large, rapidly growing, industrial cities, numbering hundreds of thousands of inhabitants, had almost no schools for the masses. On August 9, 1870, after the extension of the franchise, Parliament passed the elementary school law. Within fourteen years after the passage of that law the number of school children increased from 1,000,000 to 4,000,000. Forster's law exclusively regulated the external affairs of the people's schools and conscientiously guaranteed the liberty of communities and their right to self-government. Nevertheless the law met with violent opposition, and its enemies have not all disappeared yet. "For the first time," said a clergyman, "in the history of England a despotic power lays tracks for the human mind." Opposition to compulsory education is not entirely vanquished to this day. As is done in France, a large percentage of the children leave school at the conclusion of the eleventh year of age. In the streets of large cities, on the moors, and in the fields of the open country there are still roaming many hundreds of girls who receive no instruction, and still more of them would never see the inside of a school did not charity reach out its helping and saving hand.

The institutions of England for higher education of women have been frequently discussed with us during the last few years. But all these institutions and enterprises are for the benefit of the daughters of a minority which, according to German standards, are well-to-do. All these institutions are based upon peculiar national English customs and traits, both of life and education. They are all private enterprises, neither demanding nor expecting anything from the State—institutions that would jealously decline interference on the part of authority. No course of study accepted and confirmed by the State binds them; their establishment and management, their methods and aim, are not subject to State control. Those numerous well-educated and socially well-regarded but poor families that we find in Germany representing the army officers, the higher civil officers, the judiciary, the teachers, and the clergy, are entirely wanting in England, where the two extremes, wealth and poverty, touch each other. The irony in the contrast between the education given to the broad strata of the people and the luxury of education offered to the wealthy is very plainly noticeable in the education of the girls. From the elementary school there is no way into the well-equipped high schools and colleges for women. But it is gratifying to observe the self-dependence, the energy, the tenacity with which English women conquer and successfully maintain the possibilities of culture which are open to men. Higher education for women in England is entirely the work of English women. All institutions serving it stand under woman's direction and employ almost exclusively female teachers. This enormous growth is the work of scarcely more than thirty years, but centuries had prepared the way by creating for the English woman of the higher classes that prominent position she occupies in the family, in society, in the moral and intellectual life of the nation.

Characteristically English is, on the other hand, the exclusive direction of girls' education upon a practical aim obtainable by an examination. To express it in brief, there is a desire for an education according to pattern and stamp. It is not the free development of an intellectual personality, but of the final performances in examination to which the work of long years is directed. From the smallest local examination to the much-dreaded tripos at Cambridge there is spanned across the globe a net of English examinations. No one intending to reach the end can escape its meshes. It is expected and demanded of every pupil and of every student that his or her work be a preparation for an examination in view. We therefore find, in place of general humane education, a specialization which begins too early; instead of the free, unhindered work of a teacher, a laborious drudgery in mastering a certain amount of prescribed knowledge—prescribed, of course, by an examination. I vividly remember the flaming protest published in the fall of 1888 in the *Nineteenth Century Magazine* by 396 men of science and public life against this system, which crushes the most talented and

best intellects among girls and boys, and distorts the aim of education and transfers the principle of the race track and its technical term, "training," upon intellectual performances. This weighty protest gave rise to the appointment of a royal commission of inquiry into the questions of secondary education. The result of the commission's work has recently been published, and aims at an improvement of the boys' education, which will of necessity also promote and improve girls' secondary education.

English, Dutch, and French colonists transplanted the ancient European culture into the new land across the water. The women of the early settlers learned to brave the dangers of loneliness and wilderness. The conditions of their lives were favorable for the development of independent character and strong will. Women are rare at first in colonies, hence the charm they give to the house, and the grace and steadiness they bestow upon a roving existence is valued highly and bought dearly. The American women defend right, morals, and good manners inexorably. While rough combat for life and sustenance claims the men, the finer intellectual interests are readily yielded to women. The richer and easier the gain is, on new soil, the more will domestic care diminish. Immense distances gave to the American character something expansive, a feeling of unlimited possibilities for life, activity, and gain; a joyful elasticity of soul, a consciousness that nothing human is beyond his reach. These traits are found in the American woman also. She is accustomed to claim consideration for her free self-determination; her inclinations and aspirations scarcely find opposition in state and society; she wants to enjoy equal rights, but also claims equal duties. The circumscribed world of her home has become too small for her. Her ruling influence in education and questions of culture is advancing into the older Atlantic States. No difference is made between boys and girls in education in the United States. From the primer to the doctor's hat there is free intellectual competition for both sexes on the same school benches, in the same lecture room, under the same professors. A great hunger for education characterizes the American man, and even more so the American woman. The importance of schools for the public weal can never be valued higher than it is done in the United States. Women form the majority of the participants in educational congresses. The powerful movement on foot in favor of popular high schools, the so-called university extension, which had its rise in England, is essentially supported by women. Young ladies and women of more advanced age take up their residence in the slums of metropolitan cities in order to establish social settlements for the express purpose of forming a nucleus for education and improvement of the forsaken and abandoned. Girls are in the majority in the upper grades of the public schools as well as the high schools, and with the exception of universities and colleges the female sex takes the front rank among teachers and learners. The majority of all schools in the

United States maintain coeducation. That boys are to be educated to be men, that girls are to be women, and hence that they must be educated differently—this self-evident principle seems to be forgotten in America. Already nature begins to avenge herself. The American woman is slowly degenerating in consequence of her emancipation. As she leaves the sphere of her home to enter the great market of life she becomes less able and willing to fulfill natural duties. This is the opinion of distinguished physicians and clergymen. The woman question will, in the near future, assume a new aspect in the American Commonwealth. It will then no longer be able to disregard the physical and mental difference in sex which nature and civilization have created, and for the sake of the continuance of the state which can not be guaranteed for all time to come by vast supplies of immigrants from the Old World, the American education of women will have to obey the dictates of nature again.

Let us return to the conditions in our own country. Luther thought that the magistrates of all the cities in Germany should establish good schools both for boys and girls. The Prussian kings from Frederick William the First, whose order in the year 1717 laid the foundation for compulsory school attendance, made no difference between boys and girls in public education. The Reformation and the Hohenzollern dynasty created the Prussian people's school, and this institution serves both sexes equally. As a *quantité négligeable* may be considered the number of girls between 6 and 14 in Prussia who are not enjoying regular instruction by professionally prepared teachers holding State diplomas. That which is wanting in the people's schools is a sufficient number of female teachers, whose educative influence upon the girls of the upper grades could do much good in the domestic and moral habits of our rural population. In Russia thousands of women teachers keep up a fight against the powers of darkness in the most remote hamlets and villages. With us here in Germany very few women teachers are willing to serve as rural school-teachers and take upon themselves the duties which presuppose a renunciation of social and other comforts; they all rush toward the cities. The problem of female teachers has with us been considered exclusively a question concerning city schools.

I take it for granted that you are acquainted with the history and development of our secondary schools for girls. The external characteristic historical momenta are: (1) Gradual growth of private foundations; (2) slow formation of aims and method in close contact with the needs of the time; (3) then active participation of the communities in establishing and maintaining public secondary schools for girls; (4) a tendency to extend these schools to make them normal schools for the preparation of female teachers; (5) a great variety in courses of study and division into classes, from which variety only in recent years a uniform type has developed. I may also mention the fact that the

State left these schools alone for many years and spent all its strength and means upon the people's and the boys' preparatory schools. It did this with the well-understood object in view to prepare the officers of the State and the leaders of the nation. Only with hesitation the State authorities began to subject the girls' schools to regulations such as were issued for boys' schools.

These are the external characteristics, but there are also internal characteristics. They are: (1) The religious-ethical spirit of the whole; (2) the preponderance of men teachers, especially in the upper grades and in the educative branches; (3) the one-sided attention to literary, æsthetic interests, of which the disproportionate importance given to history of literature is a characteristic; (4) finally, the great variety of professional preparation of teachers in this kind of school; (5) above all, peculiar to these schools is the direction and transmission of a general education such as ladies of better situated classes of society require. At present the professional preparation has on principle been severed from the school of general culture. No examination threatens the student at the conclusion of the course of study. The schools bestow no honors; give no privileges and no diplomas. These circumstances give to the instruction of a good, thorough teacher an invaluable amount of freedom, which permits concentration, absorption, and contemplative repose, and in this I recognize an undeniable advantage for our schools.

As yet the lecture rooms of our universities are open only to very few women; as yet the professions which do not agree with the constitution of woman, and for which the State demands an academic preparation, are still closed to them, while in other civilized states the women have succeeded in securing admission. Is this fact explained simply by the unjust valuation of woman's work, by undervaluation of woman's capacity, by the imperiousness of man and his anxiety lest woman's competition will interfere with his success? Let me say, first, that the State with us is not only a police institution to protect life and property, but its object is the promotion and equalization of all interests of culture. It is obliged to ask, with every newly arising claim, whether and in how far it meets recognized needs. It is a sound and safe policy of the public-school authorities not to interfere with things that are only beginning and developing, but to give time and space for healthy growth; not to feed and nurse young forms artificially, but to wait patiently and see whether they have a vigorous life and find good soil among the people. To remodel anything ancient that has long stood the test in order to introduce something new that has not as yet proved its value is always doubtful. Now, with us, as it is well understood, the condition for academic or university study is the graduation diploma, which is granted alone by classical high schools, called gymnasia. But we have no gymnasia for young ladies. Shall the State establish them? Prussia is not wealthy enough for that, and should we really lead our

girls upon an educational path which is exclusively designed and planned for boys intending to devote themselves to the higher professions and offices of the State? Shall we for the girls fix a course of study with the authority of the State, a course which many and many of us think badly needs reform? When, as in Berlin, Leipsic, and Karlsruhe, private gymnasia for girls are established in order to give them an education such as the boys' schools offer, the State authorities certainly do not interfere or prohibit it. The first Prussian female graduate has passed her examination well. That which is wanting in the realm of higher education of women here in Germany is not so much favors from the State as great philanthropists, such as Rockefeller and Holloway, and wealthy corporations, such as the Brewers' Guild in London, which gave large donations for the higher education of women. Such means flow very scantily in Germany, as the interest for our aspirations is not very extended as yet among the people. More pressing needs claim the strength and means of the State.

And yet excellent things have been done with us; three Prussian universities have opened the doors of the philosophic faculty to women teachers; a scientific examination gives to the best of them a higher aim and in their school work a broader track than formerly. We may hope that the profession of medicine will be opened to the woman, as far as it may become a profession for them, and as far as the needs of the State may be congruent with their desires. He who refers to America, England, or France in this connection forgets or overlooks the fundamental difference in German and foreign universities and the culture which they offer. The German university is, as Paulsen states it, both a laboratory for scientific investigation and an institution for the highest scientific instruction; hence it is more than a higher professional school. The university professor is considered in Germany a scientific investigator at the same time that he is a teacher. This unity of investigation and instruction gives to the German university its peculiar character. But the claims and demands for preparation and the conditions of admission are very much higher than in other countries, where a student only seeks a limited professional education, as in France, or an extension of his general education, as in England and America.

An institution like the Victoria Lyceum here in Berlin would, if it were established in England or the United States, unquestionably be called a university. Look at its list of lecture courses of a single academic year. There is scarcely one of the great sciences that is not represented. The list of professors exhibits distinguished names in philosophic, economic, historic, philologic, geographic, and physical investigation. For the first time in the history of this school a theological course and physiological lectures are opened. Almost all the fields of mental life are cultivated. Its work is greater and more profound than that of many a foreign university, hence we have every

reason to rejoice over our accomplishments, though we are fully aware of the fact that much is still to be done.

To look at that which is our own must not narrow down our mind, must not prevent us from looking beyond our own boundaries and appreciating what others have done; attainments in foreign countries will induce us to renewed efforts. With reference to the higher education of women in Germany, let us proudly quote Goethe's words: "This much is ours, this much let us maintain." And let us add: "Upon this foundation let us continue to build."

---

#### X.—PUBLIC INSTRUCTION IN THE GRAND DUCHY OF LUXEMBURG.<sup>1</sup>

In the Grand Duchy of Luxemburg (area, 1,000 square miles; population, 212,000) there were, in the year 1894-95, 3 gymnasiums or colleges, 1 commercial and industrial school, 1 agricultural school, 1 normal school, 755 primary schools, 8 girls' boarding schools, 26 day nurseries, and 499 schools for adults.

Of the higher institutions of learning, the progymnasium at Echternach had 10 professors and 93 students; the gymnasium at Diekirch 16 professors and 246 students; the gymnasium at Luxemburg 25 professors and 507 students; the commercial and industrial school at Luxemburg 24 professors and 322 students.

The course of study in these gymnasiums covered the following branches: The German, French, Latin, and Greek languages; religion, mathematics, history, geography, zoology, botany, physics, philosophy, drawing, and gymnastics. The study of the English language was not compulsory.

The branches taught in the industrial school were: Religion; the German, French, and English languages; mathematics, history, geography, physics, drawing, and stenography.

The following branches were taught in the commercial school: Religion; the German, French, and English languages (Spanish and Italian were optional); history, geography, commercial arithmetic, commercial science, commercial law, commercial correspondence, technology, political economy, and stenography.

The Luxemburg gymnasium and the industrial and commercial school together form the Luxemburg Atheneum, an institution with 49 professors and 829 students.

Applicants for admission to the lowest class of any of these colleges must be at least 12 years of age. The course of instruction occupies six years. In the industrial and commercial school each pupil pays for tuition in the three lower classes \$8 per annum; in the three higher classes, \$12 per annum. At the gymnasium in Diekirch the charge for tuition ranges from \$8 to \$10 per annum. In the other

---

<sup>1</sup> Reported by George H. Murphy, vice-commercial agent.

gymnasiums tuition is free to needy pupils who pass their examinations creditably.

The total amount paid by the Government in salaries to the 75 professors in these four colleges is about \$52,000 per annum, the average salary being \$700.

The so-called schools for adults were, in the year just ended, mostly (466) public schools. There were 336 schools for males, with 5,069 pupils, and 130 for females, with 3,090 pupils. Most of these pupils were from 13 to 18 years of age. A large majority of the schools were open less than five months during the year, and even then only for a few hours once or twice a week. In 24 of the boys' schools only drawing was taught. In the others instruction was given in from two to five branches: Drawing, arithmetic, geometry, bookkeeping, and German or French.

Of the 130 girls' schools, 43 were devoted entirely to needlework. Instruction was given in the others in from three to eight branches: Needlework, arithmetic, bookkeeping, housekeeping, hygiene, natural sciences, and German or French.

Most of the teachers in these schools were regular primary school-teachers, who in this way added a small amount to their incomes. The entire amount paid to the teachers of these 466 schools for adults was about \$11,600, an average of less than \$25 per teacher.

The following statistical tables describe concisely the status of primary instruction in this country:

#### I.—Pupils.

|                            | Num-<br>ber of<br>schools. | Pupils.  |        |                                 |        |                                 |        |         |         |         |
|----------------------------|----------------------------|--|--------|---------------------------------|--------|---------------------------------|--------|---------|---------|---------|
|                            |                            | In the obliga-<br>tory age (6<br>to 12 years). |        | Above the<br>obligatory<br>age. |        | Below the<br>obligatory<br>age. |        | Total.  | Boys.   | Girls.  |

| Day nurseries .....         | 26       | .....             | 11               | 18    | 29     |
| Total .....                 | 789      | 435               | 204              | 222   | a861   |
|                             |          |                   | 426              |       |        |

a Including 79 teachers in private schools, of whom 9 were males and 70 females, 61 of the latter being nuns.

## III.—Salaries of teachers of public primary schools.

|                                | Teachers. | Total amount of salaries, inclusive of value of lodgings supplied. |
|--------------------------------|-----------|--|
| Higher primary schools .....   | 26        | \$7, 429. 54   |
| Ordinary primary schools ..... | 737       | 151, 431. 10   |
| Day nurseries .....            | 19        | 1, 511. 19   |
| Total .....                    | 782       | 160, 371. 83   |

This last table shows that in the year 1893-94 the average total earnings of each primary school-teacher in the Grand Duchy of Luxemburg amounted to about \$205.

The following table shows the total and average earnings of male and female teachers in the various grades of public primary schools, inclusive of the value of lodgings supplied:

|                                | Male teachers. | Total amount of salaries. | Average salary. | Female teachers. | Total amount of salaries. | Average salary.   |
|--------------------------------|----------------|---------------------------|-----------------|------------------|---------------------------|-------------------|
| Higher primary schools .....   | 13             | \$6, 213. 64              | \$478           | <i>a</i> 13      | \$1, 215. 90              | <i>a</i> \$93. 50 |
| Ordinary primary schools ..... | 413            | 100, 383. 53              | 243             | 324              | 51, 047. 57               | 157. 00           |
| Day nurseries .....            |                |                           |                 | 19               | 1, 511. 19                | 80. 00            |
| Total .....                    | 426            | 106, 597. 17              | 250             | 356              | 53, 774. 66               | 151. 00           |

*a* Nine of these teachers resided in convents.

Minister of the interior, 1893-94: Tak van Poortvliet.

Inspectors of primary instruction: First circuit, Mr. J. B. A. J. M. Verheijen, te 's Hertogenbosh (November, 1880) (North Brabant, Gelderland, and Limburg); second circuit, Mr. J. C. Fabius, te Delft (April, 1890) (South Holland, North Holland, Zealand, and Utrecht); third circuit, Mr. A. G. A. Baron Sloet tot Oldhuis (April, 1890) (Friesland, Overijssel, Groningen, and Drenthe).

District school superintendents, 25.

Arrondissement school superintendents, 94.

#### CLASSIFICATION OF SCHOOLS IN CONFORMITY WITH LAWS GOVERNING PRIMARY, SECONDARY, AND SUPERIOR INSTRUCTION IN HOLLAND.

##### *Primary instruction.*

- (1) Public primary schools supported by the State (Government) or communes.
- (2) Private primary schools (subsidized and nonsubsidized).
- (3) Home instruction.
- (4) Infant schools and asylums.
- (5) Primary instruction in prison schools.
- (I) Normal schools maintained by the State.
- (II) Normal courses maintained by the State.
- (III) Normal schools maintained by the communes.
- (IV) Normal schools and courses maintained by private corporations and persons.

##### *Secondary instruction.*

- (1) Burgher schools supported by communes.
- (2) Higher burgher schools supported by communes.
- (3) Higher burgher schools supported by the State.
- (4) Higher burgher schools supported by private citizens.
- (5) Industrial, drawing, and trade schools.
- (6) State Academy of Liberal Arts.
- (7) State normal school for the training of drawing masters.
- (8) Schools for the training of Government officials for the Netherland-Indies.
- (9) Agricultural schools.
- (10) Polytechnic school.
- (11) Military and naval schools.
- (12) Veterinary schools.
- (13) Training schools for midwives.
- (14) Schools for deaf-mutes, blind, idiots, etc.

---

<sup>1</sup>By Miss Sophia Nussbaum.

*Superior instruction.*

## (A) PUBLIC.

- (1) State universities (*a*) of Leyden, (*b*) Utrecht, (*c*) Groningen.
- (2) University of Amsterdam supported by the commune.
- (3) Gymnasias and progymnasias.

## (B) PRIVATE.

- (1) Free University of Amsterdam.
- (2) Denominational theological schools, preparatory schools, Latin schools, colleges, etc.

## THE NETHERLANDS.

## I. CENTRAL GOVERNMENT.

The first constitution of the Netherlands after its reconstruction as a kingdom was adopted in 1815 and revised in 1848 and 1887. By virtue of this charter the Netherlands is a constitutional hereditary monarchy.

The executive power of the State belongs exclusively to the Sovereign, while the whole legislative authority rests conjointly in the Sovereign and Parliament, the latter consisting of two chambers, called the States-General. The Upper or First Chamber is composed of 50 members, elected by the 11 States from the highest assessed inhabitants and from certain high and important officials specified by law. The Second Chamber of the States-General numbers 100 deputies and is elected directly from among all the male citizens who are 30 years of age and are not deprived by judicial sentence of their eligibility or the administration and the disposal of their property.

The Government and the Second Chamber only have the right of introducing new bills, the functions of the Upper Chamber being restricted to approving or rejecting them, without the right of amendment.

## II. LOCAL GOVERNMENT.

The territory of the Netherlands is divided into 11 provinces and 1,123 communes.

Each province has its own representative body, "The provincial states." The members are elected for six years directly from among the male Dutch inhabitants of the province who are 25 years of age, one-half of the members retiring every three years. The form of election and the mode of procedure in this body are the same as that for the Second Chamber of the States-General. Voters must be inhabitants of the province. Representation is based on the population of the province, and numbers from 80 for South Holland to 35 for Drenthe. The provincial states are entitled to make ordinances concerning the welfare of the province, and to raise taxes in accordance with the law. All provincial ordinances must be approved by the King. The provincial states exercise the right of control over the municipalities and elect members of the Upper Chamber of the States-General, and see that

the common law is executed in their provinces. They meet twice a year, as a rule, in public. A permanent commission, composed of 6 of their members, called the states deputies, is charged with the executive power in the province and the administration of its affairs. Both the deputies and the provincial states are presided over by a commissioner appointed by the Sovereign, who in the former assembly has a deciding vote, but in the latter only a deliberative voice. He is the chief magistrate of the province. Only the members of the states deputies receive an allowance.

Each of the communes forms a corporation, with its own interests and rights, subject to the general law. Every commune has a council elected for six years by the same voters as for the provincial states, provided they are inhabitants of the commune; one-third of the council retires every two years. All the Dutch male inhabitants of 23 years of age are eligible for the council, the membership of which varies from 7 to 39, according to population. These councils have the right of making and enforcing by-laws concerning the communal welfare; they may raise taxes according to rules prescribed by common law, and each commune receives a fixed annual allowance out of the State treasury. All by-laws may be vetoed by the Sovereign. The municipal budget and the resolutions to alienate municipal property require the approbation of the states deputies of the province. The council meets in public as often as may be necessary, and is presided over by a mayor, appointed by the Sovereign for six years. The executive power is vested in a college formed by the mayor and two, three, or four aldermen elected by the council. This college is also charged with the execution of the common law. The municipal police is under the authority of the mayor, and as a State functionary the mayor supervises the actions of the council, and may suspend their resolutions for thirty days, but is bound when so doing to inform the states deputies of the province.

The area of the Netherlands is 12,648 English square miles.

Population, 4,732,911, according to census of December 31, 1893, or 372.20 inhabitants per square mile. Of the total population in 1893, there were 2,341,484 males and 2,391,427 females.

*Religion.*—According to the terms of the constitution, entire liberty of conscience and complete social equality are granted to the members of all religious denominations.

#### HISTORICAL SKETCH OF EDUCATION.

Holland has always been among the leading countries of Europe in the educational line; in fact, the Dutch Government was the first one in this century to promulgate official school laws, viz, in 1801, 1803, and 1806.

The first school known in Holland was founded in Utrecht by Willebrod, the first bishop of the Frisians, who in 690 landed on the shores

of the Netherlands. This school attained great fame, and it is said that Pepin, the son of Charles Martel, was educated there. The educational influence of the apostle of the Germans, St. Boniface, was very noticeable. Under Gregory, one of his scholars, this town assembled within its walls the studious youths from all the neighboring countries (*quidam autem et de Baguarus et Suevis*). During the invasion of the Normans this school was suspended, but in the year 917 it was reestablished, and soon attained its former splendor. The three sons of Emperor Heinrich der Vogler (Henry the Fowler), Otto, Heinrich, and Bruno, were educated there. The latter, who was Duke of Lorraine, while archbishop of Cologne, was known for his great learning. In the beginning of the twelfth century Utrecht had no less than 5 flourishing schools, some of which had, besides the clergymen, who were superintendents, a *rector scholarum*.

At the same period several monasteries achieved distinction as schools of learning, among them those of Egmond, Nijmegen, Middelburg in Zealand, and Adouwert near Groningen. During the twelfth century the influential communes of Holland and Belgium established, in addition to the cathedral, cloister, and ecclesiastical institutions, communal schools for the burghers and the common people. The privilege to open such schools was always obtained from a count, who conferred it either upon cities or private individuals as a special favor. The instruction in the communal schools in Holland, unlike those in Belgium, was withdrawn entirely from the supervision of the clergy and became essentially secular. Grants were made to the following cities: To Dortrecht in 1290, by Count Floris V; 'sGravenhage 1322, Leyden 1324, Rotterdam 1328, etc., by William III; Delft and Amsterdam 1334, by William IV; Leyden again in 1357, Haarlem 1389, Alkmar 1398, Hoorn 1358 and 1390, The Hague 1393, Schiedam and Oudewater 1394, Rotterdam 1402, by Albert of Bavaria. The Dutch communal schools were divided into principal and branch schools, and in the former Latin was taught. John Cele's school, which was of this class, enjoyed an excellent reputation in the fourteenth century, and is said to have numbered as high as 1,000 pupils of all nationalities. The Hieronymians, who founded the Society of the Brethren of Life, established numerous schools during the fifteenth century, in which the poor were taught gratuitously.

The first university of Holland, in Leyden, was founded by William the Silent in 1575; a second was established at Franeker in 1585; and in the eighteenth century three universities were opened, respectively, at Utrecht, 1638, Groningen, 1644, and at Herdervijk in 1648. Many celebrated men of science and philosophy occupied chairs at these institutions, including Grotius, Spinoza, Dousa, Huyghens, Gronovius, Heinsius, Perizonius, Raphelengius, Schultens, Meursius, and Boerhave. The learned Pope Hadrian IV was born in Utrecht. The universities and Latin schools maintained their reputation during the eighteenth

century, but popular instruction was not developed in the same degree, for the methods used were purely mechanical and tended to extinguish the intelligence of the pupils rather than stimulate it.

At the beginning of the nineteenth century (1811) Cuvier made rather an unfavorable report on the condition of the universities and Latin schools of Holland. The government established by Napoleon I introduced certain reforms which were subsequently ratified and developed by King William I. Dutch legislation regarding primary instruction has attracted the attention not only of writers, but of the Governments of various countries, on account of its hostility to the principle of denominational schools. The first impulse to an improved system of primary instruction in Holland was given by John Nieuvenhuysen, a Mennonite clergyman in Groningen, who founded in that city in 1784 the Society of Public Good (*Maatschappij tot Nut van't Algemeen*), whose objects were to promote elementary instruction—moral, social, and religious. This society was very successful and the Government supported it in its efforts. The basis of the Dutch system was laid in the celebrated law of 1806, prepared by M. van den Ende. This school law remained unchanged until 1857, when amendments were made. The primary instruction act of 1857 was supplemented by another act of August 18, 1879, making important alterations which tended to extend public education. It was again considerably altered by the act of December, 1889. This last act gave unrestricted liberty to the establishing of private schools whereby public instruction is diminished. The Government, however, retained absolute supervision of all private schools. The constitution of 1848 placed all religious denominations on an equal footing. The principle of secular and coeducational schools had at first the assent and support of ministers of every creed, including the Roman Catholics; but after 1848 a general opposition developed against this plan. A new party of orthodox Protestants started, named after Groen van Prinsterer, a prominent professor and writer, and these claimed that the Roman Catholics were strictly carrying into execution the law of 1806, as they excluded in their teaching everything of a doctrinal character, even the Bible itself. In the endeavor to check the anticipated advances of the church the Groenists, who were in a small minority in the chambers of 1857, when the new educational law was framed, attacked the principle of the schools, denouncing them as breeding places of atheism and immorality and demanding in their place denominational schools which should provide religious instruction. The majority was composed of Roman Catholics who preferred to exclude religious instruction entirely from the schools rather than it should inculcate Protestant ideas, liberals who were in favor of a total separation of church and state, and dissenters of every denomination. The important question of denominational and nondenominational schools was fully discussed in the legislature. The result was that the non-denominational character of the school system was maintained, but with

modifications of its general details. The retention of the word "Christian" education in the law gave great offense to many members of the Liberal party favoring nondenominational schools, but the Roman Catholics especially insisted upon expunging the word "Christian," as they declared that practically it meant Protestant, and most of them voted against the law because the word "Christian" was retained. The law, however, was passed by a large majority and public instruction in Holland remained nominally Christian, but in a sense so broad that it would have been expressed better by the term "moral." The law of 1857 provided that while public instruction should impart all necessary secular knowledge and develop the understanding of the pupils, it should at the same time train them to the practice of every Christian and social virtue, and also provided that primary schools should be conducted at the expense of the communes. Two modifications had taken place in the Dutch school system from 1806 to 1848, to wit, the establishment of normal schools in 1816 as an integral part of the system, and a change in the administration of the private schools for the middle classes, for these were found upon inspection to be inferior to the public schools, which were originally intended for the poor.

To enter the public schools a certificate of poverty was demanded, which virtually excluded children of the middle class, and it was claimed that the State should provide for the proper education of middle-class children as well as the poor, since the middle classes were the largest taxpayers in support of primary schools. To meet this reasonable demand two grades of public schools were added to the school system—French intermediate and the classical schools. Intermediate schools were therefore established in towns where, by paying a fee of from 6 to 10 cents per week, all classes of children could obtain an education at public expense. French schools of a superior grade were also founded, their course including English and French, other modern languages being taught for a higher tuition. Above the French schools were placed Latin and classical institutions. The system of primary instruction in Holland became, therefore, gradually enlarged, so as to include the higher, common, and classical institutions.

The educational system of Holland is very complicated, inasmuch as the various grades of educational establishments are provided for separately, each being partly supported by the General Government or provinces, communes, or individual citizens, as the case may be. Primary instruction includes home and school education. The tuition given to children, members of not more than three families, is called "home instruction." All other tuition, including schools for the poor, orphan asylums, reformatory schools, charitable institutions, and others for the public benefit, is by law designated as "school instruction."

Primary schools, which are maintained entirely or conjointly by the communes or the State (Government), are considered public schools, and all others are private. The law of August 17, 1878, provides that every

subsidy from a public fund, be it never so small, shall transfer a school to the domain of public schools. Consequently the private schools mentioned in article 3 of the law of 1857, which, on account of their nondenominational character, have obtained a subsidy from public funds, are no longer classed as private schools. They are grouped with the public schools and must submit to the rules governing them. In the official reports published in Holland these schools are called "subsidized private schools," in which charges for tuition may be imposed upon all children.

The question of State subsidies to sectarian private schools profoundly agitated the people of Holland for almost a whole generation; it was finally settled by the law of December 8, 1889, which provided that instead of paying each community 30 per cent of all expenses, each one should receive from the State a certain amount, determined by the number of pupils, and this rule is extended to private and parochial schools. The State is responsible for 25 per cent of the cost of founding or purchasing school buildings. But while State schools are under State supervision, parochial schools are not, for there the clergy is the ruling power. While formerly the tuition fees of the State schools were small, they are now graded in proportion to the State subsidy. The act of 1889 of course reduced the attendance at the public schools and increased the number of pupils at the private seminaries. A sufficient number of schools for all children without distinction of denominations are maintained in each commune. Neighboring parishes may conjointly support schools, and children from different communes may be admitted thereto. Opportunities are also given to children to continue their education in the so-called "repetition schools." It is also provided that children attending schools shall receive religious instruction from special teachers at hours appointed for that purpose.

The object of primary instruction in the schools is to impart useful knowledge and to develop the intellectual powers of the child, as well as to train him in all Christian and social virtues. School attendance is not compulsory, though this question is a constant theme for discussion in the legislature. For neglected children there are charity "particular" schools, but they may be admitted to training institutions and educated therein.

The provisions of the law for the inspection and management of schools and the due qualification of teachers are two of the most important features of the system. Prominent men, like Cuvier (1811), Cousin, the great French philosopher and pedagogue (1836), Mr. Nichols (1838), Dr. Bache (1838), Mr. Hickson (1840), in their reports on education in Holland have dwelt largely on these points, and their conclusions have had great influence in producing the present superior condition of the Dutch schools.

One unfavorable feature of the common schools in Holland is the overcrowding of the classes. From 40 to 50 children are considered

the maximum number in a class, but these limits, not being specified by law, are frequently overstepped. In many places, usually in cities, these conditions are so unfavorable that the Government schools are not able to meet their requirements when not assisted by private schools.

The Government report shows that 10.88 per cent of the children of school age (6 to 12) did not receive instruction during the year 1889. Out of 10,386 conscripts 91 per cent could read and write; 151, or 1.45 per cent, could only read, and 800, or 7.55 per cent, could neither read nor write; the highest percentage of illiteracy, 11.06, being in North Brabant.

M. Cuvier, in his report on coeducation in Holland, 1811, says, in regard to the subject of coeducation:

It being contrary to the customs of our country, we were rather shocked to find that both sexes were admitted to the same schools. The authorities, however, assured us that they never had cause to regret this arrangement. It is the custom not only in schools for the poor but in all burgher schools, in which parents pay quite high tuition fees and have ample means to send their children to private schools.

M. Cousin, in his report of 1836, says, on the same subject:

One thing that surprised me greatly about these schools is that both sexes are admitted not only to the same rooms, but are seated side by side on the benches.

In the *Revue Pédagogique Belge*, February 15, 1895, we read:

The greater number of schools in the Netherlands are coeducational. Coeducation of the sexes, which was prohibited in France a century ago by the immortal Condorcet, is in the Netherlands an established principle of pedagogy, and successfully applied. Girls and boys of primary schools are in general educated together from their sixth to their twelfth year, inclusive. In the lower classes the boys are instructed by women teachers. Compulsory instruction has not yet been settled by law; yet there are at present very few children not attending some primary school.

The following extracts from the *Revue Pédagogique Belge* for March 15, 1894, are given, as they present some interesting points of information:

The school law, passed in December, 1889, substituted for article 54 certain conditions under which free schools may receive support from the Government, which are as follows:

1. Instruction must comprise: (a) reading; (b) writing; (c) arithmetic; (d) elements of the Dutch language; (e) history of the country; (f) geography; (g) rudiments of natural sciences; (h) singing; (i) elements of drawing; (j) free gymnastic exercises and deportment.

2. In girls' schools: (k) the useful branches of manual training, provided that the pupils do not receive satisfactory instruction somewhere else in this branch.

3. Instruction for girls must comprise at least eighteen hours per week, of which two are devoted to manual labor.

A time-table must be sent to the inspector of the arrondissement, one copy of which must be posted at the school, in a place where it can be seen by all, including a table indicating holidays and vacations.

4. The number of teachers must be the same as that fixed for public schools by articles 23 and 24 of the law. (a) The school must be directed by a teacher 23 years of age or over who has the rank of a head teacher, though the direction may be intrusted

temporarily—but not exceeding six months—to a teacher below 23 years of age who is not of the rank mentioned. (b) The director must be aided by an assistant teacher when the number of pupils exceeds 40; by at least two teachers when the number reaches 90, and for each group of 55 pupils over 90, one additional teacher.

In order to entitle a free school to a State subsidy, it must have, beginning with January, 1894, in addition to the head teacher, the following corps of teachers:

| Pupils.         | 1894. | 1895. | 1897. | 1899. | Pupils.         | 1894. | 1895. | 1897. | 1899. |
|-----------------|-------|-------|-------|-------|-----------------|-------|-------|-------|-------|
| 41 to 90.....   | 1     | 1     | 1     | 1     | 310 to 364..... | 3     | 4     | 5     | 6     |
| 91 to 144.....  | 1     | 2     | 2     | 2     | 365 to 419..... | 4     | 5     | 6     | 7     |
| 145 to 199..... | 2     | 2     | 3     | 3     | 420 to 474..... | 5     | 6     | 7     | 8     |
| 200 to 254..... | 2     | 3     | 4     | 4     | 475 to 529..... | 6     | 7     | 8     | 9     |
| 255 to 309..... | 3     | 3     | 4     | 5     |                 |       |       |       |       |

All such teachers must hold a diploma furnished by the State board. Schools that can not receive State aid are as follows: (a) Where the pupils above 6 years of age do not exceed 25; (b) schools that receive an annual remuneration of 80 florins or more per pupil; (c) schools that during six months have not filled the vacancy of head teacher by a titular of that rank or where during four months the place of an assistant teacher has been vacant; (d) schools established for mercantile purposes.

A school board desiring a subsidy should address their request to the State deputies (permanent corps of deputies) of the province in which the school is established.

Before the 1st day of May the State deputies must decide whether the school is conducted according to the rules of the law, and if so, they determine the amount of State aid to be granted in conformity with article 45 of the law, and send their decision without delay to the minister, as well as to the inspector of primary instruction and the school board. Within the period of thirty days after the date of this finding an appeal may be made by the provincial commissioner, the inspector, or the school board. A royal decree regulates the amount of subsidy, and the law provides the means of operation.

The subsidy is calculated upon the same basis as that for public schools (see regulations of article 45):

For director:

|                                   |          |
|-----------------------------------|----------|
| School of 90 pupils or less.....  | \$100.50 |
| School of 91 to 199 pupils.....   | 120.60   |
| School of 200 to 309 pupils.....  | 160.00   |
| School of 310 to 419 pupils.....  | 201.00   |
| School of 420 pupils or more..... | 241.00   |

For each of the assistant teachers, in agreement with conditions mentioned above:

|                                   |         |
|-----------------------------------|---------|
| School of 41 to 90 pupils.....    | \$60.30 |
| School of 91 pupils and more..... | 80.40   |

If these assistant teachers have reached their twenty-third year and have the rank of a head teacher, \$120.60.

When the staff of teachers exceeds the minimum as determined by article 24 of the law, the subvention is increased for 1 teacher to \$60.30 where the school has 90 pupils or less and to \$80.40 in a school with 91 to 309 pupils; for 2 teachers or more to \$80.40 per teacher where the school has 310 pupils and over.

One should by no means overlook the fact that these figures represent the amount of State subvention only, and not the real remuneration of the members of the teaching force. The communal teachers have a remuneration fixed by the community according to prescriptions of the law. The nonofficial schools fix the remuneration of teachers as they please.

If the school teaches, in addition to the obligatory branches, at least two of the following subjects, (1) principles of the French language; (2) principles of the

German language; (3) principles of the English language, or (4) principles of mathematics, the subsidy is increased to \$80.40 for 1 teacher where there are 90 pupils or less; to \$100.60 per teacher, with an allowance for two more teachers, if there are 90 to 199 pupils; and to \$100.60 per teacher, with an allowance for three additional teachers, if the school numbers 200 pupils and over.

Instruction can not be given in buildings or on premises that have been condemned by the inspector of the medical service as unhealthy or too small for accommodating all the children. The inspector must give his reasons for disapprobation in writing and send copies of the same to the permanent corps of deputies, the communal administration, the school inspector, and the school director. The permanent corps of deputies directs the burgomasters and aldermen of the community where such premises are situated to publish the declaration.

An appeal against the inspector's decision can be made to the permanent corps of deputies by (a) the inspector of the school district; (b) the director of the school; (c) the proprietor or tenant of the premises; (d) the parents or teachers of the pupils.

The appeal must be made within thirty days. A final appeal may be addressed to the Crown against the decision of the corps of deputies. During the period of appeal and until the final decision the instruction may be continued on the premises, unless the inspector of the sanitary service has ordered it closed for reasons set forth in a written report; but instruction may be recommenced if the inspector of the sanitary service declares in writing that the premises have been sufficiently improved and the number of pupils properly limited.

The above shows that the law has laid down precise instructions concerning subsidies to free schools, so as to prevent the Government from sustaining institutions that may be undesirable for any reason. A school must be a good school in every respect to entitle it to State aid. Communal schools receive State subsidies rated according to the number of pupils and teachers and in agreement to the scale given above, besides 25 per cent of the expenditures of establishment, building, or grounds, in as far as these expenditures are not incumbent upon some other party. The rooms of these schools may be put, by the communal authority, at the disposal of those who wish to give religious instruction after class hours. Free schools receiving subsidies may introduce religious instruction or not; the State does not interfere in this matter. The Netherlands adopted the principle of religious neutrality in the public schools by the law of 1806, the constitution of 1846, and the laws of 1857 and 1878.

At a recent date the Government proposed to the Chambers to subsidize "middle schools for girls." This project created opposition on the part of the "feministes," to which the ministry has been constrained to defer, for it now seems certain that Minister van Houten will abandon the idea. The "feministes" make it their aim to suppress the special schools for girls. They demand that all middle schools shall be made coeducational, and that the Government shall only grant subsidies to institutions for both sexes. M. van Houten is personally in favor of this theory, as his former writings prove, but the Roman Catholics are hostile to the principle of coeducation of the sexes.

Young girls who desire to devote themselves to the higher education attend the courses of the "gymnasia." There are in Holland about

29 of these "gymnasia," of which 4 are nonsubsidized. These all belong to the communes, which decide whether a gymnasium shall be coeducational or reserved exclusively for young men; but in 1894 the Roman Catholic provinces of Maastricht and Breda refused to open their gymnasia to young girls. In the Protestant provinces it is different; in Rotterdam, for example, there are at present 13, and in Amsterdam 26 young women attending the courses of such coeducational institutions. In every instance the boys show the greatest deference for their girl fellow-students. Nothing detrimental to the cause of coeducation has been noticed in these schools.

There are four universities in the Netherlands which admit women to their courses. Between 1880-81 and 1893-94 the celebrated University of Utrecht admitted 118 women students. This year 55 young ladies were matriculated; at Groningen 13, Utrecht 16, Leiden 11, and at the communal university of Amsterdam 15. Of these young women, 11 study medicine, 19 philosophy and letters, 12 natural sciences, and 13 elective branches.

Holland has but 4 women doctors. The first, Mlle. Aletta Jacobs, who has a diploma from Groningen University, established herself in Amsterdam on September 15, 1879, after having completed a most brilliant course of studies, where she was authorized by Minister Thorbecke to practice medicine. Mlle. Jacobs has had the courage to defend and propagate in Holland the Malthusian doctrine, and though ridiculed and upbraided at the outset, she has finally succeeded in inculcating her ideas into the minds of many eminent persons of the country. The Malthusian Society of Holland, which is constantly increasing in adherents, numbers among its honorary members M. S. Van Houten, the prime minister, and has for its president M. B. H. Heldt, member of the States-General. There are also in its ranks other men, distinguished alike for their learning and prominence. Mlle. Jacobs has become the wife of one of the most eminent men in Amsterdam, M. G. V. Gerittson, who is famous as a financier, and is considered one of the foremost orators of the Second Chamber of the States-General.

Another woman physician, Mme. Du Saar, has made a great reputation as an oculist. Mme. Tusschenbroek was many years assistant to M. Mendes, of Lyons, who is the first gynecologist of Amsterdam and stands high in that branch of his profession. The fourth woman doctor is Mme. Johanna C. Spruyt.

A large number of young girls practice pharmacy, which profession seems appropriate to their sex. There are in the Netherlands 727 so-called "aides" (assistants), of whom 414 are men and 313 women. But, although the Hollandish universities have distributed 15 apothecary diplomas to young girls there is not one woman who conducts a private pharmacy, though it is said one will shortly be opened in Utrecht, conducted by Mme. Th. Olivier.

There are seven women possessing apothecary's diplomas who prac-

tice their profession, among whom are Mme. Alice Grutterink, who is chief pharmacist of the Coolsingel Hospital, in Rotterdam; and another is pharmacist at the Hospital Wilhelmina, of Amsterdam. Since 1880, a lady pharmacist, Mlle. Charlotte Jacobs, who is a sister of Dr. Gerittson, née Aletta Jacobs, has established herself in Batavia, where she owns a pharmacy and conducts it with the assistance of her husband.

There are also in Holland several women dentists and first-class nurses, who were trained in the special schools of Croix-Rouge, in La Haye, or Croix-Blanche, of Amsterdam.

Mr. Ipsen, in Vor Ungdom, says:

The energy with which the education of the higher grades is pursued in Holland in the various branches, and the consequent abnormal increase in the learned professions has led to serious results. Nervousness, which formerly was exceptional, has found a productive soil in the Netherlands, and facts show that knowledge in many instances has been bought too dearly. Even the phlegmatic character of the Hollanders can not withstand the pressure, and a reaction has already supervened, whose influence, it is hoped, will be felt when a normal equilibrium has been regained.

#### SUPERINTENDENCE OF PRIMARY SCHOOLS.

The State supervision of schools, under the supreme control of the minister of the interior, is in charge of inspectors, district school superintendents, and superintendents of arrondissements.

A provincial board is composed of 1 inspector and 1 school superintendent of each district in the respective provinces. The provincial boards of primary instruction meet three times a year, receive the reports of all the inspectors, consider the interests of primary education, and make an annual statement to the minister of the interior, who has the authority to convoke at the capital an assembly of delegates from provincial boards, in order to discuss topics of general educational interest.

The local supervision of schools rests upon the burgomaster and the aldermen.

*Inspectors.*—There are 3 inspectors, whose jurisdiction embraces from 3 to 4 provinces each; 25 district school superintendents, 1 for each district; and 1 school superintendent for each of the 94 arrondissements. For the sake of greater security, the councilors of a community may also appoint commissions to inspect all schools at least twice a year and ascertain if the law governing elementary instruction has been carried out.

Communities that may unite to establish and support schools can have a commission in common, composed of their burgomaster and aldermen, and, according to the amendments of the law of 1878, without regard to the number of inhabitants, though formerly the law demanded 3,000. For communities exceeding this number a special commission had to be appointed by the local councils.

Inspectors are nominated, suspended, or discharged by the King.

They receive in addition to their annual salary an allowance for traveling and incidental expenses while performing their official duties.

According to article 77 of the law, inspectors must visit the schools and communicate, either orally or in writing, with the district and arrondissement school superintendents and the local commissions and councils for the purpose of devising means for the improvement of public instruction. They must consult the minister of the interior on official business and submit to him annually a general report on the condition of schools, and such report must be based upon written reports of the local boards and upon personal and private notes.

Once a year the inspectors are to be convened by the minister of the interior to deliberate upon questions of public education under his direction.

District school superintendents are nominated by the King for life, and may be suspended, discharged, or pensioned, where the necessity arises, by his authority also. They are sworn in by the minister of the interior and are obliged to reside in a locality pointed out to him, and may hold another office.

They shall visit institutions for the training of teachers in their respective districts, attend meetings of the district school superintendents for the purpose of discussing school matters, and report annually before the 1st of May to the inspector of their district, and send a copy of such report to the States-General.

Arrondissement school superintendents are nominated by the King for a term of six years, but are eligible for renomination. They are sworn in before the royal commissioner of the province, and can at any time be discharged by the King. These superintendents must reside within the borders of their jurisdiction, unless they receive a special permit from the minister to live elsewhere.

They shall keep a record of all public and public-private [semipublic] schools in their arrondissements and of such teachers employed as are classed under article 8 of the law. They shall have knowledge of the school books used in each school, pay stated visits to all normal schools and normal institutions, report to the district school superintendent on all school affairs, and attend the meetings of the school commissioners.

The King, as the highest authority, is the final arbitrator on all questions arising in school matters concerning the teachers. He extends privileges to teachers and grants subsidies to the communes for school purposes and fixes the boundaries of school districts, etc. The minister of the interior acts as adviser and counselor to the King in all these affairs.

The parish council of Hilversum, in establishing new regulations for the appointment of school committees, have recently decreed that two women shall be included in each committee. The minister in response to an inquiry concerning the legality of this action replied "that the law does not prevent women from occupying a place on school committees." The decision was received with applause by the friends of education.

Under the law of the Netherlands the term "lager onderwijs" (primary instruction) does not apply to—

(a) Instructors of special branches, as singing, needlework for girls, drawing, principles of agriculture, gymnastics, or fancywork.

(b) Schools in which such branches are exclusively taught.

(c) Schools in which children over 6 years of age are not admitted and where only preparatory lessons are given. Thus nursery or infant schools do not come under the provision of the law, because only preparatory instruction is imparted to children under 6 years of age. These schools, however, are supported both by public and private funds.

(d) Military instructors.

(e) Schools for the deaf and dumb, blind, idiots, or for those defective in speech.

*Number and kinds of primary schools in the 11 provinces.*

| Year.                         | Public. | Subsidized private schools. <i>a</i> | Nonsubsidized denominational schools. | Total. |

"REPETITION" SCHOOLS.<sup>1</sup>

At the close of 1889 519 communes had 1 each of these schools, and 138 other communes had evening schools, distributed as follows:

| Province.           | Number of communes with— |                     | Province.        | Number of communes with— |                     |
|---------------------|--------------------------|---------------------|------------------|--------------------------|---------------------|
|                     | Evening schools.         | Repetition schools. |                  | Evening schools.         | Repetition schools. |
| North Brabant ..... | 41                       | 70                  | Overijssel ..... | 4                        | 24                  |
| Gelderland .....    | 12                       | 65                  | Groningen .....  | 3                        | 50                  |
| South Holland ..... | 13                       | 90                  | Drenthe .....    | 1                        | 24                  |
| North Holland ..... | 11                       | 75                  | Limburg .....    | 8                        | 2                   |
| Zealand .....       | 26                       | 64                  |                  |                          |                     |
| Utrecht .....       | 12                       | 27                  | Total .....      | 138                      | 519                 |
| Friesland .....     | 7                        | 28                  |                  |                          |                     |

The following table presents a record of the population of Holland (census of January 1, 1894, and January 1, 1890), the number of children of school age, and of those not receiving primary instruction during the year, compared with the record of January 1, 1889:

|  | January 1— |           |           | Difference in five years. |
|--|------------|-----------|-----------|---------------------------|
|  | 1894.      | 1890.     | 1889.     |                           |
| Population:                                |            |           |           |                           |
| Men .....                                  | 2,341,484  | 2,228,487 | 2,232,183 | +109,301                  |
| Women .....                                | 2,391,427  | 2,282,928 | 2,273,749 | +117,678                  |
| Total .....                                | 4,731,911  | 4,511,415 | 4,505,932 | +225,979                  |
| Children over 6 and under 12 years of age: |            |           |           |                           |
| Boys .....                                 | 315,509    | 301,571   | 301,997   | + 13,512                  |
| Girls .....                                | 311,602    | 298,545   | 299,059   | + 12,543                  |
| Total .....                                | 627,111    | 600,116   | 601,056   | + 26,055                  |
| Not receiving primary instruction—         |            |           |           |                           |
| Boys .....                                 | 26,983     | 29,101    | 31,935    | — 4,952                   |
| Girls .....                                | 33,675     | 36,188    | 39,386    | — 5,711                   |
| Total .....                                | 60,658     | 65,289    | 71,321    | — 10,663                  |

The foregoing table shows that the number of children over 6 and under 12 in 1889 was increased by 26,055 in 1894, or 4.31 per cent; the number of those who did not receive primary instruction was decreased by 10,663 or 14.97 per cent.

Out of the total population on January 1, 1889, of 4,505,932 inhabitants, there were 601,056 children, 301,997 boys and 299,059 girls of school age. Of these, 31,935 boys and 39,386 girls, making a total of 71,321, or 11.87 per cent, did not receive instruction in public or private schools. In 1893-94 this number was 60,658, or 9.67 per cent of all the children of school age, 627,111. Consequently 967 children (including the blind, deaf, and dumb, children of strangers, and those whose parents could not provide proper clothing) in each 10,000 from 6 to 12 years of age were not enrolled in public or private schools.

<sup>1</sup> According to the latest statistics, 1893-94, there are now 111 evening and 543 repetition schools in operation in Holland.

*Pupils belonging to day schools.*

In 1893-94 there has been a general decrease from 1888-89 in all departments except in the girls' department in public schools.

The number of day pupils instructed gratuitously is shown in the following table:

|                                    | January 1— |          |          |          |          |          | Difference in<br>five years. |          |
|------------------------------------|------------|----------|----------|----------|----------|----------|------------------------------|----------|
|                                    | 1893-94.   |          | 1889-90. |          | 1888-89. |          |                              |          |
|                                    | Boys.      | Girls.   | Boys.    | Girls.   | Boys.    | Girls.   | Boys.                        | Girls.   |
| Public schools .....               | 127, 729   | 104, 949 | 136, 575 | 112, 920 | 135, 444 | 113, 012 | —7, 715                      | — 8, 063 |
| Subsidized private schools .....   | 2          | 109      | 115      | 623      | 123      | 628      | — 126                        | — 519    |
| Nonsubsidized private schools..... | 23, 547    | 33, 028  | 21, 076  | 31, 599  | 21, 473  | 30, 467  | +2, 074                      | + 2, 561 |
| Total .....                        | 151, 278   | 138, 086 | 157, 766 | 145, 142 | 157, 045 | 144, 107 | —5, 767                      | — 6, 021 |

The above table shows that the number of children instructed gratuitously in 1893 decreased by 11,788 from the number instructed five years previously, while in 1888 there was an increase of 4,366 over 1887-88.

*Pupils attending evening schools exclusively.*

|                                    | January 1— |        |          |        |          |        | Difference in<br>five years. |        |
|------------------------------------|------------|--------|----------|--------|----------|--------|------------------------------|--------|
|                                    | 1893-94.   |        | 1889-90. |        | 1888-89. |        |                              |        |
|                                    | Boys.      | Girls. | Boys.    | Girls. | Boys.    | Girls. | Boys.                        | Girls. |
| Public schools.....                | 1, 605     | 383    | 1, 889   | 467    | 2, 131   | 671    | —526                         | —288   |
| Subsidized private schools.....    | 15         | .....  | 24       | .....  | 22       | .....  | — 7                          | .....  |
| Nonsubsidized private schools..... | 1, 354     | 757    | 1, 402   | 462    | 1, 372   | 563    | — 18                         | +194   |
| Total .....                        | 2, 974     | 1, 140 | 3, 315   | 929    | 3, 525   | 1, 234 | —551                         | — 94   |

The above figures indicate a slight decrease in the attendance at the evening schools, except in the nonsubsidized private schools for girls.

*Pupils attending "repetition" (continuation) schools.*

| Girls.....                     | 4,201      | 3,966    | 3,522    | + 679                           |

The number of those attending repetition schools in 1893 increased principally in the public schools and in the nonsubsidized private institutions for boys, while a small decrease is noticed in the subsidized private schools and a somewhat larger decrease in the nonsubsidized private schools for girls.

By adding the number of children of school age (6 to 12) for 1893, given in the table on page 489, to the number of children attending repetition schools (over 12 years of age) we obtain a total of 646,577 children, and for 1889 a total of 618,633 children.

The teachers employed in the foregoing schools numbered 16,953 in 1893, and 15,192 in 1889. The average of pupils to each teacher was 43 and 45, respectively. The number of pupils in attendance on May 1 is taken as the average for the scholastic year.

The employment at labor of children under 12 years of age was prohibited in 1889. School attendance is encouraged by means of prizes, school entertainments, and rewards, and distribution of savings-bank books, principally in 269 communes. A sum of about \$15,968 was spent in this manner in 1893.

The attendance at repetition schools is not compulsory, and instruction is given gratuitously. The expenses are borne by the communes.

The public infant schools are intended for poor children from 3 to 6 years of age. Leyden has, for instance, three schools of this kind; in each of them there are from 300 to 400 children. Infant schools have been in operation ever since 1806, when a regulation of the law governing public instruction enjoined upon the inspectors "to make endeavors for the establishment of a sufficient number of infant schools." These institutions prospered, especially under the patronage of the Society of Public Good, which from the year 1823 founded a considerable number. The infant schools patronized by this society were neutral in regard to religion. The various denominational communes created on their part the "salles d'asiles," having a sectarian basis. Other communes opened public infant schools. The law of 1878 on primary instruction did not include these institutions in the number of schools. They are, however, subject to the regulations of article 5 (relating to hygienic conditions and cleanliness of schoolhouses) and to article 72 (relating to the superintendence exercised by the municipalities and inspectors).

Teachers of infant schools are not required to hold a certificate of capacity, and the State has not done anything in behalf of their professional training. The Froebel method has been introduced into many of these schools.

Instruction was also extended to those detained in the various penal institutions, which include 3 reformatory schools, 31 penitentiaries, and 45 houses of detention. Children under 16 years of age are placed if necessary in one of the three State reformatories.

*Persons detained who received instruction or were excused on account of sickness or old age.*

|                                | Not admitted.                |                               | Admitted to instruction. | Total detained. |

| 1893-94.....                   | 14,880                       | 1,538                         | 4,361                    | 20,779          |
| 1889-90.....                   | 15,767                       | 763                           | 4,634                    | 21,164          |
| 1888-89.....                   | 14,891                       | 1,126                         | 3,996                    | 20,013          |
| Difference in five years.....  | -11                          | +412                          | +365                     | +766            |

The statistics show that in 1893-94 of 20,779 detained 1,538, or 7.4 per cent, were well instructed; 14,880, or 71.6 per cent, were not admitted; 4,361, or 20.98 per cent, attended the lessons.

Of the 4,361 admitted to instruction, 69.8 per cent acquired a

knowledge of the primary branches before their dismissal from penal punishment, 25.2 per cent were found deficient, and 5 per cent were unable to read or write.

From the foregoing tables it appears that kindergarten and primary instruction was imparted to the following number of children and persons:

In infant schools:

|               |          |
|---------------|----------|
| 1893-94 ..... | 106, 789 |
| 1889-90 ..... | 103, 551 |
| 1888-89 ..... | 100, 579 |

In primary schools (age 6-12):

|               |          |
|---------------|----------|
| 1893-94 ..... | 566, 453 |
| 1889-90 ..... | 534, 827 |
| 1888-89 ..... | 529, 735 |

In all penal institutions:

|               |        |
|---------------|--------|
| 1893-94 ..... | 4, 361 |
| 1889-90 ..... | 4, 634 |
| 1888-89 ..... | 3, 996 |

The school regulations require that—

Primary schools shall be open without intermission the whole year, except holidays. During class hours the master shall be present from the opening of school to closing; he must not engage in anything not connected with teaching, nor absent himself except in cases of absolute necessity. The master must not permit pupils to leave the school unnecessarily, but require attention and good behavior both in the class room and on the playgrounds. Pupils must be enrolled, as far as possible, for fixed terms. Instruction in the different branches shall, as far as possible, be conveyed to the pupils by means of the blackboard. An examination shall be held once a year at each school. Qualified pupils shall then be promoted from the lower to the higher grades, and, if circumstances permit, rewards shall be given for diligence and merit. A deserving pupil, when leaving school after completion of the course of study, shall be presented with a certificate of honor.

A code of regulations shall be drawn up for each school, and this, whether written or printed, shall be displayed on a board, hung up in the class room, and from time to time be read and explained by the master.

*Teachers.*—Under the provisions of the law of 1857 there were two classes of assistant teachers, but under subsequent regulations there are only head masters and teachers. Pupil teachers are not included in the law.

Only persons of good morals who possess the qualifications required by law are admitted as teachers. Foreign teachers must obtain a special permit from the King. These rules do not apply to those who teach children of private families exclusively nor to persons who voluntarily offer their services and receive no remuneration therefor.

Teachers are not allowed under the law to pursue any profession outside of their school duties, nor are they permitted to hold any office or allow members of their family to engage in any professional pursuit at their residences. The King, however, can suspend this regulation in special cases.

Besides the two classes of teachers mentioned, there are pupil teachers

or aspirants, i. e., young pupils who are otherwise qualified, but have not reached the requisite age, or those students in normal schools who are teaching in a primary school connected therewith. Persons teaching modern languages, drawing, gymnastics, etc., are considered "special teachers."

Women are largely employed as teachers, not only in coeducational schools but also in the classes of younger boys. It rarely happens, however, that women teachers are advanced to the highest classes. The positions in the higher grade girls' schools are remunerative and much sought after, and daughters of rich and distinguished families, who are by no means obliged to earn a living or make teaching their profession, often fill such places.

*Appointments.*—Head masters or mistresses of communal schools are appointed by the councils of the communes, who select their names from a list of candidates (not less than 6) who have passed the prescribed competitive examination. The head master and regular teachers are appointed by communal councils from lists of at least 3 candidates who have been proposed by the aldermen in concurrence with the local school superintendent. Competitive examinations are not required for these appointments.

The councils are empowered to discharge teachers from schools either by allowing them to resign, or by request of a district school inspector, or burgomaster and aldermen. In such cases the phrase "not honorably" may be added to the paper of dismissal.

In order to obtain a position as teacher it is requisite that candidates shall present to the authorities in charge of appointments certificates of qualification and moral conduct furnished by the burgomaster of the commune in which the applicant lived during the last two years, or by the commissioner of the province.

The only approach to the monitorial system in the schools of Holland is where young people of either sex, who have written authority from the school superintendent of the arrondissements, are admitted to schools as pupil teachers, under the following conditions: (a) They must be over 15 years of age and under 20; (b) they must work under the direct supervision of a competent teacher; and, (c) having performed these duties for a period of three months, a pupil teacher must produce a certificate, signed by the head master of the school to which he or she belonged, stating that conduct and progress are satisfactory.

The following corps of teachers was engaged in 1893 in 4,373 primary schools, and in 1889 in 4,215 schools:

|                       | 1893-94. | 1889-90. |
|-----------------------|----------|----------|
| Head masters .....    | 3,836    | 3,679    |
| Head mistresses ..... | 515      | 498      |
| Male teachers .....   | 8,409    | 7,571    |
| Female teachers ..... | 4,193    | 3,444    |
| Total .....           | 16,953   | 15,192   |
| Pupil teachers .....  | 2,807    | 2,332    |

These teachers were employed in the different classes of primary schools as follows:

|                                | 1893-94. |         |                 | 1889-90. |         |        |
|--------------------------------|----------|---------|-----------------|----------|---------|--------|
|                                | Male.    | Female. | Total.          | Male.    | Female. | Total. |

| Prison-school teachers .....   |          |         | <i>d</i> 52     |          |         | 55     |

*a* Increase in four years, 1,761.  
*b* Increase in four years, 78.

*c* Decrease in four years, 39.  
*d* Decrease in four years, 3.

Examinations of primary teachers, both public and private, are ordered by the State on subjects from *a* to *i*, or *a* to *k*, in article 2 of the law. Certificates of efficiency are: (*a*) Those entitling to give home or school instruction in subjects of article 2, under *a* to *i* or *k*; (*b*) those conferring the rank of head master, and entitling the person certified to give home or school instruction in subjects of article 2, under *a* to *i* or *k*, and subjects mentioned under *o*, *p*, *q*; (*c*) those entitling the teacher to give home and school instruction in enumerated subjects.

Candidates who are 18 years of age may be admitted to these examinations, and must notify the local school superintendent in due time and submit certificates of age and moral character. Such candidates may be examined either in the province in which they reside or in which they desire to be appointed. The first examination in the year is held on April 1; the second in October.

Of these candidates, 390 male and 455 female passed their final examinations at the end of the year 1893-94, and received certificates, besides 166 persons, 78 male and 88 female, in subject *j*, and 80 female in subject *k*. For 1889 there was a total of 1,137 candidates receiving teachers' certificates.

*Salaries of teachers.*—Each teacher receives a fixed annual salary, which in no instance shall be less than \$281 for the head master of a school, and not less than \$241 for those holding a diploma as head master, and not less than \$161 for regular teachers. The head master of a school is entitled to free residence and a garden, if possible, or an allowance for house rent.

In 1893 the salaries of head masters ranged from \$281 to \$1,085. Of these, 2,171 received from \$281 to \$441, and 830 ranged from \$442 to \$1,045. The highest salaries were paid to three head teachers, who received from \$1,046 to \$1,085. The salaries of regular teachers ranged from \$161 to \$643.

Three thousand one hundred and one teachers were paid salaries from \$161 to \$241; 79 teachers were paid from \$603 to \$640, and the remainder, numbering 5,838, each received from \$242 to \$602.

The funds for salaries in 1893-94 were derived from the following sources:

|   | 1893-94.  | 1889-90.  |
|---|-----------|-----------|
| A. From the Government:                                   |           |           |
| For primary-school teachers .....                         | \$4,516   | \$4,582   |
| For teachers of normal schools and practice schools ..... | 71,678    | 78,887    |
| For teachers of normal courses .....                      | 141,004   | 165,870   |
| Total .....   | 217,198   | 249,339   |
| B. From the communes:                                     |           |           |
| For head masters .....                                    | 1,205,468 | 1,156,982 |
| For teachers .....  | 2,600,001 | 2,228,777 |
| For special remunerations .....                           | 11,632    | 5,461     |
| Total .....   | 3,817,101 | 3,391,220 |
| C. From school fees .....                                 | 770       | 840       |
| General total .....                                       | 4,035,069 | 3,641,399 |
| General total in 1888-89 .....                            | 3,604,449 |           |
| Increase in five years .....                              | 430,620   |           |

*Pensions of teachers.*—Under the provision of article 38 of the law all teachers who have reached the age of 65 years, and those who are mentally or physically disabled, after ten years' service, are entitled to pensions. Head masters who are suspended by reason of schools having been discontinued receive half pay for a term of five years if within this period they do not obtain other employment the remuneration for which is equal to their previous salary as a teacher. These pensions are paid quarterly, and they amount to one-sixtieth of the annual salary for each year of service, but must never exceed two-thirds of the former salary.

In 1893 pensions were granted to 27 teachers, male and female, and to 41 head masters; in 1889 to 13 teachers and to 45 head masters. These pensions ranged from \$80 to \$523 for each head master, and from \$40 to \$321 for regular teachers. The total sum expended for pensions of public primary-school teachers amounted in 1893 to \$138,280 and in 1889 to \$114,507.

In conformity with article 41 of the law of August 17, 1878, all teachers contributed 2 per cent of their annual salaries to the pension fund, which amounted in 1893 to \$75,943 and in 1889 to \$68,103. The pension system relieves those teachers who have served faithfully as such from actual care and anxiety as to provision for old age.

The moral training of the young is regulated by articles 22 and 33 of the law:

School education shall conduce to the intellectual development of the young, who shall be trained in the Christian and social virtues by means of instruction in all appropriate and useful branches of knowledge.

The lessons of religion are intrusted entirely to the minister and special teachers of theology. Regular teachers must refrain from teaching, doing, or permitting anything at variance with the respect due to the religious convictions of other sects. A teacher guilty of offense in this respect may be suspended for a term not exceeding one year, but in case of repetition of the offense he may be suspended for an indefinite period from the duties of a public-school teacher. The introduction of religious instruction into common schools is no departure from the principles of the law. This feature has been adopted from practical considerations on account of the difficulties experienced by parents who can not obtain religious instruction for their children in other suitable places, but precautions are taken so that religious teaching shall not interfere with other lessons. The school simply is an agent between parents who desire their children to be initiated into religion and their respective religious teachers.

*Savings banks.*—Endeavor has been made by the school authorities to develop thrift in children by introducing the savings-bank system after the English model. In each class room there is kept a receptacle in shape of a flat wooden box, with numbered compartments arranged so as to receive temporarily the small earnings of the children. Once a week the contents are counted and deposited in a bank.

*School fees.*—The local authorities were allowed, under the provisions of the law of 1857, to make primary instruction gratuitous in the communes under their jurisdiction. One hundred and forty-six thousand and sixty-two, or 36 per cent of 406,329 children enrolled in public elementary schools, in 1857 received gratuitous instruction; and in 1876 50 per cent, or, including all children under some public instruction, 58 per cent.

The estimate of December 31, 1889, showed that in 166 communes no fees were charged for children attending public primary schools.

Such communes numbered in—

|           |     |           |     |
|-----------|-----|-----------|-----|
| 1888..... | 164 | 1884..... | 182 |
| 1887..... | 164 | 1883..... | 196 |
| 1886..... | 179 | 1882..... | 217 |
| 1885..... | 175 |           |     |

In a report of the United States consul at Amsterdam in 1839 we find the following information:

The public primary schools of this city are divided into four classes.

The first class, of which there are 51 at this time, are free schools.

In the second-class schools, of which there are also a goodly number, the school money charged is for 1 child 15 cents, Dutch currency, or 6 cents American money, per week; for 2 children of the same family, 12½ cents each, and for 3 children only

10 cents each per week; in the third class the charge for 1 child is 20 florins, or about \$8 per annum, and for 2 or more children of the same family 16 florins, or about \$6.40, each; in the fourth class the charge for each child is 70 florins (\$28) per annum, and for 2 children or more of same family 60 florins, or \$24, each.

*School buildings.*—The repairs and erection of school premises are regulated by articles 4, 5, and 50 of the law of August 17, 1878, and the building and furnishing of the same by the royal decrees of May 4, 1883, and August 30, 1884.

Schoolhouses in Holland are of diverse styles and have been constructed as necessity demanded; but on the whole the Dutch have not displayed much taste in the architecture of public school buildings, says Mr. Ipsen in *Vor Ungdom*. The usual plan of country schoolhouses in the Province of Utrecht in 1844 consisted of rooms about 52 by 26 feet, bisected by glass partitions, and were intended for about 150 children.

Some of these buildings much resemble the very old English schoolhouses; at The Hague, e. g., are seen square buildings without partitions, where the chief difference consists in the position of the seats for classes, and not in the room itself, the pupils being placed back to back instead of face to face.

Another plan of a school building at Amsterdam for 500 children shows only one row of desks, and the great length of the room in proportion to its width is a serious defect. Both these styles, as far as new buildings are concerned, may be considered out of date. All new schoolhouses are excellent, and provided with modern improvements. A burgher school in Leyden, erected in 1890-91, will serve as an example. It has excellent ventilation, and the class rooms have high ceilings and good light. In order to procure the best light possible windows have been cut in the partition walls of the class rooms at such a height as to prevent the pupils from seeing each other. The halls of this school are unusually broad and paved with small grooved tiles.

Mr. Ipsen, in *Vor Ungdom*, says:

In Dutch schools a Danish eye soon detects the absence of taste for embellishment and comfort which would be very inexpensive in many cases. Even in handsome new buildings there is a certain bare look, though everything is scrupulously neat and clean.

Article 6 of the law of August 17, 1878, prescribes that the area of each schoolroom be at least 0.8 square meter for each pupil, with a space of at least 3.6 cubic meters per pupil; the height of the room being 4.5. The doors of the schoolroom must not be in direct contact with the air outside. The halls and vestibules are lighted sufficiently and must be at least 2 meters wide and not lower than 2½ meters high. The outside walls of a school building shall have at least 0.23 meter thickness.

On the establishing of a new school, the communal council must

observe the following regulations of article 13 of the royal decree of May 4, 1883, in regard to school furniture:

Each school bench shall accommodate two children, and have a support for the lower part of the back. The tables shall be constructed with receptacles in which the girls may keep their needlework.

The modern equipments of schools in Holland are very handsome, without any display of extravagance. The benches and tables are made to accommodate 4 children, 2 in front and 2 in the rear, the tables being provided with a space under the lid for school necessities. There are appropriate benches in every room for scholars of different sizes, and children when entering a new class are first measured and then seated at the suitable tables. In infant and primary schools each class has its counting frame, and every slate is fitted with one of these useful devices. Great pains are taken to convey a correct idea of numbers and the principles of arithmetic by means of practical and intelligent methods. Blackboards are in general use.

*School hygiene.*—Hygienic conditions of school buildings are regulated by articles 4, 5, and 50 of the law, and the royal decree of August 29, 1884. Buildings condemned by the supervising health inspectors must remain closed for school purposes until the necessary improvements have been made. Persons transgressing against the law will be fined from \$10 to \$20, and for repeated offenses from \$20 to \$40 and imprisoned for a period of not less than eight days or more than one year. Schoolrooms must always be kept clean and in good order; and to that end they must always be aired during the recesses. Teachers are required to see that pupils are at all times cleanly, and at the same time exercise the greatest care in regard to their health. To this end baths have been introduced into some of the schools.

*School libraries.*—The arrondissement libraries increased from 94 in 1889 to 101 in 1893. The volumes were increased, during the same period, from 30,558 to 36,132. The names of 5,461 readers were registered for 1893. One thousand two hundred and eighty-eight teachers' meetings were held during the year, in the above-mentioned arrondissements, at which an average number of 3,525 public and 285 private teachers were present.

*Expenditures by the General Government for primary instruction.*

| 1886 ..... | 5, 209, 401   | 631, 691   | Total..... | 83, 778, 051  | 9, 913, 178 |

The subsidies received by the communes from the General Government have been deducted from the communal expenditures and income, otherwise these sums would have been counted twice.

The difference between expenditures for primary instruction and income from the same, 1878-1893, amounting to \$73,864,873, was paid out of the General Government and communal treasuries.

A new regulation came into operation in the Netherland Indies on November 1, 1894, for the primary schools of Europeans and that portion of the population that has been assimilated with the Europeans. For the Island of Java there has been established a public school in every group that has not less than 20 European pupils, and for the neighboring islands 1 school in each community containing 15 European pupils. These schools are also accessible to the native children who are assimilated with Europeans, provided they have a sufficient knowledge of the Dutch language. These schools include the children of the

black soldiers who are of African descent and have embraced Christianity. Such schools are partly coeducational, though there are special schools for girls. The scheme of instruction embraces reading, writing, arithmetic, the elements of the Dutch language, history of Holland and the Netherland Indies, geography, elements of natural sciences, singing, drawing, gymnastics, and in the special schools for girls, needlework. The supervision of primary instruction is intrusted to a director, assisted by several inspectors and a local commission. For inspection the Netherland Indies are divided into three divisions, the first comprising a part of Java (Bantam, Batavia, Cheribon, etc.), Sumatra, and West Borneo; the second, the rest of Java (Tegal, Pekalonga, Samarang, Japara, etc.) and South Borneo; the third, the Island of Celebes, the Moluccas, and the small islands. Beside these there are a number of private schools that are entitled to a subsidy from the Government.

#### THE NORMAL SCHOOLS (KWEEKSCHOLEN).

Normal schools are provided for by article 39, section 1, of the regulations approved by the royal decree of May 28, 1879.

In the official reports on education in Holland we find the normal schools and institutions for the training of teachers and head teachers, although properly classified under secondary instruction, included under the heading of primary instruction.

A large number of normal institutions are maintained and provided for by the State, which are designated as training schools and city normal courses.

The State grants a subsidy to all normal schools that are founded by the communes; they must, however, meet the requirements of the State institutions. A practice school (*leerschool*) is connected with each normal school, in which the students practice teaching.

The directors and teachers of normal schools are appointed by the King, and such schools have a four-years course with four classes. In each class there are about 20 students.

In normal schools for young men, which are day schools, students may live at the homes of private families in the vicinity, while normal institutes for young women are generally boarding schools, in all of which the scholastic year commences on the first Monday in September. Holidays of eight days at Easter and ten at Christmas are given, as well as a six-weeks vacation preceding the first Monday in September.

Candidates desiring admission to a normal school must pass an examination before the director and teachers in accordance with a programme arranged by them and approved by the minister of the interior. This programme is published every January in the *Nederlandsch Staatscourant*. Candidates obtaining the highest marks are admitted. They must have attended ordinary elementary schools and preparatory classes for normal courses before they can be admitted to the regular course of a normal institute. Teachers must require all students to attend

religious instruction, which is given at stated hours, and also their churches. Books and school material are furnished free of cost.

The programme of every normal school includes: (1) Reading; (2) writing; (3) arithmetic; (4) composition; (5) the Dutch language; (6) general and natural history; (7) geography; (8) natural sciences; (9) singing; (10) violin and piano; (11) principles of the French, German, and English languages; (12) mathematics; (13) pencil drawing; (14) gymnastics; (15) agriculture; (16) theory of teaching and pedagogy.

The minister of the interior can temporarily dispense with subjects 11 to 15.

#### I. STATE TRAINING SCHOOLS FOR TEACHERS (MEN). (RIJKSKWEEK-SCHOLEN VOOR ONDERWIJZERS.)

On September 1, 1893, there were 463 students enrolled in 6 training schools maintained by the Government. Of 130 students in the higher class, 78 obtained diplomas at the final examinations held in 1894. The practice schools which are connected with the training schools numbered 1,661 students. These practice schools are regular primary schools supported by the State (Government), and they employ about 58 teachers. Sixty-nine teachers were employed in the normal schools, besides 8 gymnastic teachers.

The following table shows the distribution of students, pupils, and teachers in the above-mentioned schools, 1893-94:

|                        | Normal schools. |           | Practice schools. |           |
|------------------------|-----------------|-----------|-------------------|-----------|
|                        | Students.       | Teachers. | Pupils.           | Teachers. |
| 's Hertogenbosch ..... | 84              | 11        | 240               | 7         |
| Nijmegen .....         |                 |           |                   |           |
| Haarlem .....          | 96              | 13        | 239               | 8         |
| Middelburg .....       | 72              | 12        | 309               | 10        |
| Deventer .....         | 78              | 10        | 293               | 10        |
| Groningen .....        | 68              | 11        | 280               | 10        |
| Maastricht .....       | 70              | 12        | 300               | 13        |
| Total .....            | 468             | 69        | 1,661             | 58        |

The above table does not include the gymnastic teachers. Eighty-one persons made application for admission to the new normal school in Nijmegen for the course beginning in January, 1894. Sixty-five students attended the courses of gymnastics for teachers of gymnastics at Haarlem, Deventer, Groningen, and Maastricht.

The programme of the State normal schools includes: (1) The Hollandish language, reading, grammar, orthography, and literature; (2) writing; (3) natural and general history; (4) mathematical, physical, and economical geography and drawing of charts; (5) arithmetic; (6) composition; (7) natural sciences (history, physics, and chemistry); (8) singing and harmony; (9) pedagogics (education and instruction); (10) drawing; (11) mathematics (algebra and geometry); (12) modern languages; (13) horticulture and agriculture; (14) anatomy; (15) physiology and hygiene, and (16) gymnastics.

*Expenditures for State normal schools and practice schools.*

| Decrease in four years..... | 16,222   | .....    |

## II. NORMAL COURSES SUSTAINED BY THE STATE (RIJKSNORMAAL-LESSEN).

At the close of 1893 there were 43 State normal courses in operation of Class A and 53 of Class B. These courses extend over four years and include four progressive classes.

The programme of normal course B includes the Dutch language, reading and writing, national history, geography, arithmetic, geometry, natural history, singing, pedagogy, and useful handiwork for girls, besides manual training for boys. The programme of normal course A includes the same subjects and in addition thereto general history, pencil drawing, mathematics, gymnastics, and one of the modern languages.

Candidates who have successfully completed the course of primary instruction are admitted to the preparatory class up to 14 years of age; those over 14 can enter the normal course.

A director is at the head of each of these institutions, which are connected with practice schools. The scholastic year commences April 1, and closes March 31, the holidays and vacations during the year not exceeding six weeks in all. The annual school programme is arranged each January at a meeting of the teachers and the director.

Three thousand and twenty-seven students, 1,480 male and 1,547 female, attended these courses in 1893-94. Several city normal courses had been suspended in 1889 on account of a decrease in attendance; 2,698 students, 1,481 male and 1,217 female.

## III. TRAINING SCHOOLS FOR TEACHERS SUPPORTED BY COMMUNES (GEMEENTELIJKE KWEEKSCHOLEN).

There are three institutions of this kind:

(1) *The training school in Amsterdam* is coeducational, and has two parallel divisions. Division 1 is for the training of those who aspire to the rank of a teacher; division 2 is for teachers aspiring to the rank of head teacher, or for persons who study special branches. All students of the highest grade (class 4) took part in the final examination. The course of division 1 embraces four years and is attended by pupils from 14 to 18 years of age, the first two years being devoted to theoretical instruction; the last two to theoretical and practical training.

Practical training is acquired in the practice school of the normal school, or in public or private schools of Amsterdam, this conforming to regulations of article 8 of the law. Instruction and school material are provided free of cost. Male students who distinguish themselves can obtain a scholarship of \$30 per annum. There were 25 students, 12 men and 13 women, who passed successful examinations, besides 2 women who were not admitted the year before.

One hundred and fifty-four students attended the school in the beginning of the year and 12 additional students entered during the run of the year. The number of teachers in the normal and practice school, inclusive, was about 25. In 1889 there were 133 students in attendance. These schools are under the jurisdiction of the school superintendent and local commission of primary instruction.

(2) *The training school for teachers (coeducational) in Leyden.*—At the end of the year 1893–94 this school numbered 28 head teachers, 8 female head teachers, 54 male and 32 female teachers, 9 female teachers with certificates conforming to article 56a, 89 normal pupils, 31 aspirant normal pupils, and 20 other students who studied special branches. Students under 15 are not admitted, and aspirants for the lowest grade must have attained the age of 13 years. None can enter without a preliminary examination. The course is completed in six years. Pedagogics and violin or piano instruction belong to the course of study.

Twenty-two normal pupils were admitted to the final examination coming under article 56a of the law on primary instruction, and 18 passed successfully; and 11 out of 13 passed at a later examination. Eleven teachers, 10 male and 1 female, obtained the diploma coming under article 56b of the law; 3 men and 1 woman in the French language; 1 woman in German; 4 women in English. There were about 25 teachers employed. A practice school is connected with the training school.

(3) *Training school for female teachers in Groningen.*—This was founded by the Society of Public Good (1816), and has since 1882 been supported by the commune. The school opens May 1, and closes April 30 each year. The burgomaster and aldermen are the superintendents; a special commission of supervision is appointed by the local council, by whom are also appointed the directress and the other teachers. The annual fee amounts to \$20 each. Students from other communes are accommodated by private families at a cost of \$160 per annum for board and room.

The course for 1893 opened on May 1 with 54 students and about 17 teachers, including 7 teachers in the primary department of the institution. Five of these students who attended the fourth class (highest) passed a successful examination at the end of the year and obtained teachers' certificates. These three schools received from the Government a total of \$15,692, or, respectively, \$9,648, \$2,122, \$3,922.

IV. PRIVATE NORMAL SCHOOLS AND COURSES FOR MEN AND WOMEN  
(INRICHTINGEN VAN BIJZONDEREN AARD, TER OPLEIDING VAN  
ONDERWIJZERS AND ONDERWIJZERESSEN).

The following private normal schools, out of a total of 57 in the country, received subsidies from the Government in 1893:

|  |          |
|--|----------|
| Training school for female teachers in Arnhem.....   | \$4, 215 |
| Christian normal school for female teachers in Zetten.....                                   | 2, 295   |
| Christian normal school in Nijmegen.....   | 2, 170   |
| Groen van Prinsterer school in Doetinchem.....   | 1, 897   |
| Christian normal school in The Hague.....  | 2, 283   |
| Normal training school of the Reformed Church for male and female teachers in Amsterdam..... | 2, 372   |
| Training school for female teachers in Haarlem.....  | 3, 522   |
| Roman Catholic training school in Eijsden.....   | 1, 938   |
| Roman Catholic training school in Echt.....  | 1, 873   |
| Total.....   | 22, 565  |

The following numbers of students were enrolled in the above-mentioned normal schools: 714 males and 1,151 females; of these, 67 and 126, respectively, obtained teachers' certificates.

The normal courses, 89 in number, had an attendance of 689 male students and 896 female students; 266 persons took private lessons from 95 of the principals of normal schools, 137 men and 129 women.

*Review of State normal courses, training schools supported by communes, and of private institutions for the training of teachers, showing on December 31, 1893, an enrollment of 4,946 students.*

|                                       | 2,098 male students. |        |                                 | 2,848 female students. |        |                                 |

*Review of the number of normal schools and institutions, and number of pupils enrolled, at beginning of the school year 1893-94.*

|   | Schools. | Pupils. |
|---|----------|---------|
| State training schools.....                   | 7        | 468     |
| State normal courses.....                     | 96       | 3, 027  |
| Communal training schools.....                | 3        | 443     |
| Private normal schools.....                   | 57       | 1, 865  |
| Private normal courses.....                   | 89       | 1, 585  |
| Head teachers giving private instruction..... | 95       | 266     |
| Courses for head teachers.....                | 26       | 894     |
| Total 1893-94.....                            | 373      | 8, 548  |
| Total 1889-90.....                            | 189      | 4, 556  |

The number of head teachers giving private instruction to aspirant teachers was not given in the annual report for 1889-90, nor the number of private normal courses.

#### V. COURSES FOR THE TRAINING OF HEAD TEACHERS.

In 1893 there was a total of 26 institutions of this kind in 25 cities (2 in Leeuwarden). The enrollment was 671 male and 223 female students, or a total of 894; 175 students, 143 male and 32 female, obtained the diploma of head teacher.

In 1889 there were only 22 of these institutions, with 786 students in attendance.

##### *Expenditures for the training of teachers.*

|   | 1893-94.           | 1889-90.  |
|---|--------------------|-----------|
| State normal schools.....                     | \$139,866          | \$156,085 |
| State normal courses.....                     | 160,308            | 185,660   |
| State subventions to normal institutions..... | 54,881             | 19,722    |
| Expenditures by communes.....                 | 64,327             | 71,024    |
| Total.....                                    | 419,382<br>432,491 | 432,491   |
| Decrease in four years.....                   | 13,109             |           |

Three hundred and fifty-five thousand and fifty-five dollars of the total expenditure for 1893 and \$361,467 for 1889 were provided for by the General Government, while \$64,327 for 1893 and \$71,024 for 1889 were paid out of the communal treasury.

#### SECONDARY INSTRUCTION (MIDDELBAAR ONDERWIJS).

There were in 1890 two inspectors of secondary instruction: Dr. W. B. J. van Eyk, The Hague (1886), for the provinces of North Brabant, Gelderland, Zealand, Utrecht, Overijssel, and Limburg; Dr. A. T. van Aken, The Hague (1883), for South Holland, North Holland, Friesland, Groningen, and Drenthe; F. B. Löhnis (1892) having charge of the agricultural schools.

Secondary instruction is based upon the law of May 2, 1863, amended by the laws of June 28, 1876, and April 25, 1879.

Until the enactment of the law of 1857 the burgher schools, which corresponded to German "Realschulen," had been classed as primary only. It was then found necessary to establish intermediate schools, which are a grade between primary and higher schools. The law of 1863 classed the burgher schools, higher burgher schools, agricultural schools, polytechnical schools, and all industrial schools under secondary instruction.

Schools of secondary instruction are either public or private, the public being those established and maintained by communes, provinces, and the State, separately or conjointly, and all others are private. Pri-

vate secondary or middle schools may, however, receive subsidies from communes, provinces, or the State.

Secondary tuition given to children of not more than three families is considered home instruction. Secondary instruction is gratuitous, but the highest fee in communal schools is \$5 per annum, and in higher burgher schools, supported by the State, it is \$25 per annum.

*Officials having charge of secondary instruction.*—The minister of the interior is the supreme authority, and invests the local commissions, who are elected by the local council, with the supervision of the various institutions. In 1893 there were 8 commissions, consisting of 97 members, in charge of examining such persons as desired to obtain a diploma of secondary teacher. Each commission has a president. The 3 inspectors of secondary instruction are nominated by the King; one of them having special superintendence of the State agricultural school. For the manual-labor training schools there are several ladies appointed on the board of commissioners. The directors of the higher burgher schools are in charge of the general supervision of everything pertaining to these schools.

*Teachers.*—Only persons holding a diploma of recognized universities and secondary training schools, and a certificate of good moral standing, as required by law, are allowed to impart secondary instruction. From this rule are exempted (1) persons who instruct children of one family only; (2) those who do not make teaching their profession, but have obtained a concession from the King to teach without remuneration.

In the higher burgher schools only male teachers are employed.

The head teacher has the title of director, and all teachers are nominated by the King. The director regulates the programme in conjunction with the teachers. Directors and teachers must obtain a permit from the minister of the interior before accepting a position at any public or private institution, or for giving private lessons. Foreigners must apply to the King for concessions.

Directors and teachers of higher burgher schools supported by the communes are appointed by a local council from a list of candidates recommended by local authorities.

Pensions are regulated by articles 31 to 35 of the law. Teachers are considered as Government officials and are all entitled to a pension from the State, and in determining the amount of pension the length of time spent in the public service is taken into consideration. The directors and teachers contribute annually to the general pension fund, and the communes refund to the Government one-half of the sum spent in pensions. The regulations governing the pensions of primary teachers agree in the principal points with those governing the pensions of secondary instructors.

I. BURGHIER DAY AND EVENING SCHOOLS, AND INSTITUTIONS CLASSED WITH THEM ACCORDING TO ARTICLE 14 OF THE LAW.

They are classified as follows:

1. Burgher day and evening schools.
2. Apprentice schools.
3. Trade schools.
4. Drawing and industrial schools.
5. The Academy of Liberal Arts in Rotterdam.
6. Private burgher day and evening schools.

Most of these schools are evening schools. They were established principally for the purpose of training artisans, mechanics, and agriculturists. In each community of 10,000 inhabitants or more at least one burgher day and evening school must be established by the communal authority. The King can suspend this regulation where the inhabitants of a community live so far apart that it would be inconvenient for the pupils to attend such a school, or if other provisions have been made to fulfill the requirements. School fees may be collected, but not to exceed \$5 per annum. A total of 39 institutions of this kind are in operation in the larger cities:

(a) Thirty-two of class 1 are evening schools; the school at Leeuwarden is the only day school of this kind. There is only one school of class 2. These schools together had a total of 3,593 pupils enrolled in December, 1893.

Thirteen hundred and seventy-six candidates were examined for admission to the schools at the beginning of the course. Of these 1,001 passed and 375 failed. At the final examination there were 285 pupils examined, of whom 237 passed and 48 failed.

Two hundred and ninety-two teachers were employed in the above schools.

(b) There were 6 schools of classes 3 to 6 in operation: The trade school in The Hague, the Academy of Liberal Arts, the trade school in Rotterdam, and the drawing school in Delfshaven (Rotterdam), the private burgher evening school in Leyden, and the industrial school in Helder, with an attendance of 1,563 pupils; teachers, 127.

Three hundred and thirty-two candidates were examined for admission at the beginning of the course, of which number 104 failed to pass; 228 were admitted. At the final examination 69 were successful and 8 failed.

One hundred and forty-seven teachers employed in schools of classes 1 and 2, and 7 employed in the schools of classes 3 to 6, inclusive, taught in the higher burgher schools also.

The total sum expended for teachers' salaries was, in schools of classes 1 and 2, \$49,089; classes 3 to 6, inclusive, \$30,116; total, 1893-94, \$79,205; 1889-90, \$70,429; increase in four years, \$8,776.

*General totals.*

| Year.                       | Schools. | Pupils. | Teachers. | Expenditures for salaries. |
|-----------------------------|----------|---------|-----------|----------------------------|
| 1893-94.....                | 40       | 5,156   | 419       | \$79,204                   |
| 1889-90.....                | 39       | 4,500   | 405       | 70,429                     |
| Increase in four years..... | 1        | 656     | 14        | 8,775                      |

## II. INDUSTRIAL AND DRAWING SCHOOLS, PROFESSIONAL SCHOOLS, ETC.

There were 27 public, 19 subsidized private, and 5 nonsubsidized private institutions of the first and second classes, and 20 of the latter; of these 17 were subsidized. They embrace day and evening schools.

| Year.                       | Schools. | Pupils enrolled. | Teachers. |
|-----------------------------|----------|------------------|-----------|
| 1893-94.....                | 71       | 8,358            | 513       |
| 1889-90.....                | 61       | 5,526            | 353       |
| Increase in four years..... | 10       | 2,832            | 160       |

The institution called "Colony Nederlandsch Mettray" was founded in 1851 by Willem Hendrik Suringer for needy and neglected children of the Protestant church. After having finished the regular course the pupils are trained in agricultural or industrial pursuits, etc. Only pupils from 10 to 14 years of age are admitted. Many entertain the erroneous idea that "Mettray" is a reformatory colony, but anyone who visits it can easily recognize its object. The income of the institution is derived from gifts, annual contributions, interests from legacies, rents from farms, remuneration for work performed in the workshops, etc., and from registration fees.

For a boy attending 1 of the 35 divisions a fee of \$32 per annum must be paid; those attending all divisions pay \$60 and an entrance fee of \$4. The colony is superintended by 7 commissioners and 4 inspectors, each of the latter living in 1 of the 4 family dwellings. Besides these there are head masters, 1 in each workshop, and 7 teachers.

The programme of the foregoing schools includes the following studies: Mathematics, first principles of theoretical and applied mechanics and a thorough knowledge of instruments, physics and chemistry, natural history, technical knowledge of agriculture, rudiments of geography and history, Hollandish, fundamental knowledge of political economy, pencil and rectilinear drawing, and gymnastics. The local council may add to this programme the principles of technology, modeling, and one of the modern languages.

The directors of the burgher schools are appointed by the local council from the list of applicants approved by the mayor and magistrates, after having been examined by the inspector. The number of teachers and their salaries are fixed by the local council, and must be approved by the States-General.

The teachers of industry are trained at the normal schools and State Academy of Liberal Arts in Amsterdam and at the Academy of Liberal Arts at The Hague.

Directors and teachers of burgher schools, whose maintenance is imposed upon the communes, are pensioned by the Government. The community, however, refunds half of the sum to the State, which sum is added to the State budget. Other expenses for burgher schools must be met by the communes.

### III. HIGHER BURGHER SCHOOLS.

These schools are principally for the training of overseers, superintendents, and the commercial classes. They are divided into two grades, one comprising a course of five years and the other a course of three years.

By virtue of the law there shall be not less than 12 higher State burgher schools in operation in the country, and in at least 5 of these the course must be five years. Anybody wishing to be admitted to such a school must pass an examination before the director and teachers, and pupils can not be promoted to higher classes without a previous public examination, but they may be transferred from a higher burgher school to another and be placed in the grade to which they belong, provided they have a certificate from the director of the school which they hitherto attended. The courses commence on the first Monday in September, three school vacations being given during the year, from the middle of July to the beginning of the course, at Christmas, and at Easter, each of the last two lasting ten days.

There are in all 61 higher burgher schools in existence; 20 are maintained by the Government, 28 by the communes receiving subsidies, 12 are nonsubsidized communal schools, and 1 a Roman Catholic institution. These were attended by 6,166 young men taking a full course and 243 students pursuing elective studies. Forty schools admitted young girls, and were attended by 282 taking a full course and 104 pursuing elective studies.

The young men were distributed in the different classes of schools as follows: One thousand three hundred and seventy-three regular, and 107, or 7.7 per cent, following elective courses, in the 20 higher State burgher schools. The other schools numbered 5,036 attendants, besides 136, or 2.7 per cent, taking elective studies. The courses of gymnastics were followed by only 4,989 of the total students.

The final examinations of these institutions are regulated by articles 55 and 57 of the law, May 2, 1863 (Stbl. No. 50), and March 10, 1883 (Stbl. No. 31), and are conducted in the following manner:

(1) The royal commission nominates a board of examiners before May 1 of each year, and the parish is informed of the place and time of examinations.

(2) The law requires oral and written examinations. The latter

comprise 10 branches and the former 5 different groups of subjects: Mathematics and mechanics; physics; historical, commercial, and political sciences; modern languages and literature; Netherland-Indian languages and pencil and rectilinear drawing; in all, 17 branches.

(3) The board of examiners is divided into subcommissions, one for each subject, and each subcommissioner determines on the oral examination in the special subject to which he has been assigned, or the written examination.

(4) After the discussion and preparation of the various exercises the conclusions are sent to the inspectors, who make selections from the proposed questions, which are then printed at Government expense with absolute secrecy, and the printed forms are sealed up in packages and forwarded to the respective directors.

(5) Written examinations take place on the same day in all cities, and the results are forwarded to the president of the committee.

(6) The oral examination may include all branches, but must embrace all those belonging to the written examinations. The commission determines the length of time permitted each candidate for the different subjects, while the president regulates the time spent on the oral examination.

(7) The answers to each of the 5 groups are rated by figures, from 1 to 10.

About 300 candidates present themselves each year for the final examinations. Making allowance for a moderate programme, five hours is allowed each candidate—two hours for mathematics and physics, one for history and geography, and two for languages—or a total of fifteen hundred hours, or fifty days, for all examinations; but as some of the schools require two days, the real aggregate is seventy-two days. This calculation, of course, can only be considered approximate, since at many of these schools there are more than twelve candidates. The certificates are distributed gratuitously, but diplomas of final examinations at agricultural, technological, and engineering schools require a fee of \$16.

Examinations for teachers of secondary schools and for home instructors are also held once a year, the mode of which is prescribed by the law.

Of 2,348 pupils who presented themselves for admission to the lowest class, 1,692, or 72 per cent, passed the examination, and 656, or 27.94 per cent, failed.

Three hundred and fifty-five were examined for admission to a higher class, of which 179 passed, 72 entered a lower grade, and 104 failed. There were also 140 students who entered classes without previous examinations—68 in 10 State and 72 in 19 communal higher burgher schools.

Eight hundred and eight teachers were employed at the higher burgher schools (this leaving 4 vacancies), 175 having a doctor's degree,

21 candidates (that is, young theologians who had recently graduated), 488 teachers having diplomas of secondary instruction, 35 with previous diplomas, 35 with certificates conforming to articles 82 and 89, 6 to article 90, and 34 to article 83; 14 without certificates. Twenty-seven of these teachers were employed at more than one school, which reduces the number of teachers to 777. One hundred and forty-four teachers were employed at 11 higher State burgher schools with a five-years course, 81 at 9 higher State burgher schools with a three-years course, 565 at 40 higher burgher schools supported by the communes with three or five years courses.

Higher burgher schools for boys have a laboratory with accommodations for each student, who is supplied with all necessary appurtenances including a desk with drawers for materials. Here he learns the more important chemical combinations by practical experiments, instead of committing to memory only and learning merely the qualities of the principal elements. Schools of this kind are also furnished with extensive collections of specimens in natural history, besides special conveniences for studying anatomy.

The salaries of teachers of the higher State burgher schools ranged from \$1,005 to \$1,407 for directors, who in two instances are furnished with free residence, and from \$402 to \$1,000 and over for the remaining number of teachers.

At the higher burgher schools supported by communes the salaries ranged from \$964 to \$2,200 for directors (free residence in five instances), though there were three cases where directors received less than \$964. They ranged from \$402 to \$1,000 and above for the regular teachers. The expenditures for salaries for higher State burgher schools amounted to about \$158,237 and for the communal higher burgher schools to about \$400,628, or a total of \$558,865; in 1889, \$506,756.

*Programmes of higher burgher schools.*—The five-years course includes mathematics; principles of theoretical and applied mechanics; knowledge of instruments and technology; physics and its principal applications; fundamental knowledge of mineralogy, geology, botany, and zoology; rudiments of cosmography; origin of communal, provincial, and State constitutions of Holland; political economy and statistics, especially of the Netherlands and its colonies; geography; history; Hollandish, French, English, and German literature; Latin and Malayan languages; elementary knowledge of commerce, especially of merchandise and bookkeeping; penmanship; pencil and rectilinear drawing, and gymnastics. The three-years course includes mathematics; first principles of physics and chemistry; principles of botany, zoology, and mineralogy; bookkeeping; geography; history; Hollandish, French, and English languages; penmanship; pencil and rectilinear drawing, and gymnastics.

The programmes for secondary schools for girls differ in some

respects, but they include bookkeeping, mathematics, and chemistry, besides literature. In the secondary schools for both sexes much importance is attached to modern languages and literature. Reading of classical authors as well as the literature of foreign countries is largely encouraged, and conversation in foreign languages during recreation hours is enforced upon young girls who attend these schools. The branches of natural sciences are assiduously cultivated.

#### IV. SECONDARY (OR MIDDLE) SCHOOLS FOR GIRLS.

These institutions are supported solely by the communes or private parties. There were in all 12 in operation in 1893, one of which was private. The school fees for a complete course are \$20 to \$40 per annum; for elective studies from \$4 to \$24 per annum for each subject. These courses cover three or five years, and each school has 5 classes. In 40 schools girls have been admitted to the classes of the higher schools for young men. In every instance the young men show the greatest deference for their girl fellow-students. Nothing detrimental to the cause of coeducation has been noticed in these schools.

The following table shows the places where these schools are located, and the number of pupils:

*Secondary (or middle) schools for girls.*

| Cities.                      | Pupils attending complete courses. |               |              |               |              |        | Pupils for elective studies. | General total. |
|------------------------------|------------------------------------|---------------|--------------|---------------|--------------|--------|------------------------------|----------------|
|                              | First class.                       | Second class. | Third class. | Fourth class. | Fifth class. | Total. |                              |                |

Gymnastics are taught in all these institutions except in the public secondary schools in Amsterdam and Dortrecht; 939 pupils of those taking a complete course attended the courses of gymnastics.

*Examinations.*—Three hundred and fifteen young girls made application for admission to the lowest class in these schools; 273, or 86.5 per cent, passed a satisfactory examination, and 42, or 13.5 per cent, failed. This result was less favorable than in the preceding year, 91 per cent being admitted. Of 36 examined for a higher grade, 26 were promoted, 2 entered a lower grade, and 8 failed. At the transition examination from the courses of 1892 to 1893, 889 pupils were successful and 166 could not be promoted.

One hundred and twenty-five female teachers were employed in these schools, 113 of whom held diplomas of secondary instruction, 4 diplomas as head teachers, and 8 had no certificates. There were, moreover, 27 male teachers, 20 of these having doctors' diplomas or the title of "candidate," 14 with diplomas of secondary instruction, 2 had no certificates, and 1 a certificate conforming to article 82. The teachers without diplomas were employed for singing and needlework.

The annual remuneration of the directresses ranged from \$964 to \$1,286, and in Rotterdam, Dordrecht, Utrecht, and Deventer they are entitled to free residence. The salaries of the teachers, male and female, ranged from \$420 to \$630 per annum, and the total spent in salaries for directresses was \$12,422, and for teachers \$71,176. In 1889 these sums amounted to \$12,381 and \$66,179.

#### V. AGRICULTURAL SCHOOLS.

*The State agricultural school at Wageningen* is the largest and best known, and has a higher burgher school connected with it. The attendance in 1893 was as follows: 66+1 students in the higher burgher school division; 62+1 students in Division A of agricultural school, 41+1 students in Division B, and 22 students in Division C.

This gives a total of 191 regular attendants, and 3 hearers—that is, persons who come to listen to the lectures without paying fees. The two latter divisions have been established especially for higher scientific training in agriculture; each division has several classes. The students ranged from 12 to 18 years of age and above. An experiment station is also connected with the State agricultural school, at which numerous agricultural researches were made by the students. The examinations were very satisfactory. Fifty-two students in the higher burgher school division were promoted to higher classes at the beginning of the course of 1893; 42 out of 47 in Division A, and 21 out of 26 in Division B, and 12 out of 16 in the highest class obtained diplomas. Six in Division C were promoted to the highest class and 6 others were granted diplomas. About 29 teachers were employed. Enrollment in 1889, 123 students and 4 hearers.

In the Gerard Adriaan van Swieten Landbouwschool, at Willemsoord, opened in October, 1890, the number of students must not exceed 20. They are to be trained for two years theoretically, and also practically on the farms of the Society for Public Good.

Only 7 pupils attended in 1893, under 4 teachers.

There are, moreover, 2 horticultural schools, the "Tuinbouwschool," of Amsterdam, and the "Gerard Adriaan van Swieten Tuinbouwschool," of Fredericksoord, opened in 1884, with an attendance of 27 and 40 pupils. Thirteen teachers were employed. The age for admission is 15 years, and school fees are \$24, \$34, or \$40 per annum. The total of students in 1889 was 45.

In the School of Forestry, "Gerard Adriaan van Swieten Bosch-

bouwschool," opened in 1888, 7 pupils followed the course in 1893, under 4 teachers. Boys supported by the Society of Public Good receive not only gratuitous instruction in the school of Fredericksoord, but also free board. This school receives a state subsidy of \$250; 10 students and 4 teachers in 1889.

Besides the above-mentioned agricultural and horticultural schools, there are other similar institutions in the country, and winter courses have been established in various cities, to which the Government extends subsidies. In the official report of Holland for 1893-94 we find 36 sums itemized, representing State subsidies for as many winter courses and agricultural schools.

Establishments with courses in dairy farming are maintained by 4 private associations in Oudshoorn, Bolsward, Friesland, and Geldern, and the Government in 1889 granted subsidies of \$1,206, \$1,608, \$402, and \$482, respectively, for their maintenance. These courses were attended by about 293 pupils, and 12 teachers were employed. There is no record for 1893.

The accompanying programme will suffice to show the relative value placed in the agricultural schools on the several branches of study pursued: Political economy, practical mathematics (surveying, leveling, mensuration, etc.), mechanical science as applied to agriculture and the use of agricultural machines; the construction and arrangement of farm buildings; rectilinear drawing as applied to agricultural science and machinery; natural philosophy; chemistry and meteorology in their application to agriculture, general and special botany, and zoology; the anatomy and physiology of plants and animals; the distinguishing characteristics of the different domestic animals, their diseases and medical treatment; general and special agriculture; vegetable and fruit gardening, and the cultivation of timber and fruit trees, etc. .

#### VI. THE POLYTECHNIC SCHOOL IN DELFT.

This institution is intended for the training of (a) those following industrial pursuits, and for technologists requiring a higher grade of technical and theoretical knowledge than they could acquire in the higher burgher schools comprising a five years' course; (b) civil engineers, architects, and architectural engineers.

Every student of the polytechnic school pays \$80 in advance for the annual course, which entitles him to all the advantages of the school. Those taking elective studies pay only for the subjects chosen, at the rate of \$4 per annum for each study, with one recitation per week. For four or more recitations per week the fee is \$16 per annum for each study. No entrance fees are required, and the names of students are recorded at the beginning of each school year. The course commences on the first Monday in September.

Head masters and teachers are appointed by the King, and the supervision of the polytechnic school is in the hands of a director, who is likewise nominated by the King. He is assisted in his duties by a

council consisting of the head masters of the school of which he is the president and from which the secretary is elected. The director, assisted by the council, arranges the course for the following year in May, and such programme as may be then prepared must be submitted to the minister of the interior for his approval. The director also has the general supervision over the museum and professional training departments presided over by the head master or teacher in charge of the various branches of instruction in the polytechnic school of the Kingdom.

Most of the students who have taken the course of the polytechnic school in Delft and wish to go to the East Indies as Government officials prepare themselves for such positions by taking a two or three years course in the school at Leyden for the training of officials in the East Indian service, where they are taught the Java, Malay, and Boegine languages, etc. The East Indian languages, while they are taught at Delft, do not receive that special attention that is given at Leyden, for the reason that a great proportion of the students at Delft take a second course of study at Leyden. The school in Leyden is not only open to officers in the civil service, but is free to all doctors, missionaries, etc., who are destined for service in the East Indies. To all others the tuition fee is \$75, paid in advance. No entrance fees are required.

The programme of the polytechnic school includes the higher algebra, spherical trigonometry, and analytical geometry; descriptive geometry and its applications, differential and integral calculus, surveying, leveling, and surface measurements, theoretical mechanics, applied mechanics, machinery, mechanical technology, applications of natural science, applied, practical, and analytical chemistry, chemical technology, modern manufactures, mineralogy and geology, applied geology and the working of mines, metallurgy, hydraulics, road, railroad, and bridge building, civil architecture, shipbuilding, rectilinear drawing, instruction in the use of tools, instruments, and the turning lathe; construction of models, political economy, commercial law, laws relating to engineering, public works, mining, and all industrial works.

Two hundred and forty-one students attended a complete course of engineering and technology, while 84 students pursued elective studies. There were consequently 325 students in attendance, besides two ladies attending lectures. The first-named students were all graduates from a higher burgher school, having a five years' course. Age of students from 19 to 23 years.

The results of final examinations were as follows: Of 142 candidates applying for examination, 17 withdrew, 101 obtained diplomas, and 24 failed. These examinations are regulated by articles 61 to 65 of the law.

Opportunities are offered the students to make practical experiments with surveying and measuring instruments. The teaching corps consists of about 34 persons; 1 director, 14 professors, 9 teachers, 8 assist-

ants, and 2 teachers in modeling. Five amanuenses and 1 librarian are attached to the teaching staff.

One hundred and seventy-one new works were added to the library, besides various journals, and 2,100 books were loaned out during the year.

Numerous new objects were presented, or purchased for the department of decorative architecture, the laboratories, the department of natural sciences, and others.

#### VII. SCHOOLS OF NAVIGATION.

Schools of navigation are presented in the accompanying table, with the number of teachers, students, and those receiving a certificate, and the salaries of teachers:

| Communes.                    | Name and class of schools.                    | Teachers. | Pupils.         |                          |                      | Salaries of directors. | Total salaries. |
|------------------------------|---|-----------|-----------------|--------------------------|----------------------|------------------------|-----------------|
|                              |   |           | December, 1893. | During the year 1893-94. | Receiving a diploma. |                        |                 |
| The Hague.....               | Subsidized naval school ...                   | 1         | 50              | 65                       | .....                | \$482                  | \$482           |
| Rotterdam .....              | Public naval school.....                      | 11        | 41              | 73                       | 43                   | 1,206                  | 5,548           |

a The salaries for 1889 were not given in six instances.

#### VIII. SCHOOLS FOR DEAF-MUTES AND BLIND.

The Institution of Rotterdam numbered 145 pupils, of which 119 received gratuitous instruction; 70 were partly cared for by the institution, and only 7 pupils paid fees, ranging from \$5 to \$60; 17 teachers were employed, not including the director and adjunct director; 163 pupils in 1889.

In the Institution of Groningen there were 179 pupils, most of whom were entirely cared for by the institution and only a few paid tuition fees. The teachers numbered about 30; 173 pupils in 1889.

The "St. Michiel's Gestel" enrolled 143 pupils, 83 boys and 67 girls. Most of these were entirely cared for by the institution. There were 8 teachers. The girls are taught by the Sisters of Charity; 156 pupils in 1889.

The Institute for the Blind at Amsterdam enrolled 58 children, 39

boys and 19 girls. Teachers employed, about 17 in number, were under a director; 61 pupils in 1889.

A total number of 526 pupils were enrolled in the above-mentioned institutions; teachers employed, 76, including the directors. In 1889 they numbered 558 pupils and 85 teachers.

#### IX. STATE NORMAL SCHOOL FOR THE TRAINING OF TEACHERS AND INSTRUCTORS IN DRAWING AND MODELING.

Twenty-four ladies and 27 gentlemen attended the course in pencil drawing in Division A, and 6 gentlemen the course in architectural and mechanical drawing in Division B. There were besides 7 visiting students (hospitants). The entire course embraces three years. Eleven of the students obtained diplomas at the final examination. The school employed 11 teachers. The practice school numbered 58 students, 6 girls and 52 boys. The total expenditure was \$8,369, or \$5,776 for teachers' salaries and \$2,593 for material. The income from tuition fees was \$951, this leaving an excess of expenditure over income of \$7,418, which was paid out of the Government treasury. Seventy-one students in 1889, besides 38 in practice school.

#### X. INSTRUCTION IN THE LANGUAGES, ETHNOLOGY, AND COUNTRIES OF THE NETHERLAND INDIES IN THE INSTITUTION OF DELFT.

One hundred and forty-three students were attending this school. All of these were graduates from higher burgher schools with a five-years course, or from gymnasia with a six-years course. One was a graduate from the agricultural school in Wageningen and one an officer on furlough from the East Indies. Twenty-one out of 46 candidates who passed the entrance examination of the school were rejected because their physique did not answer the requirements of the service in the Netherland Indies. In 1889 there were 73 students and 16 teachers.

The programme of the course is regulated by the burgomaster and the aldermen. It includes:

|                                   | Hours per week. |              |
|-----------------------------------|-----------------|--------------|
|                                   | First year.     | Second year. |
| Malayan language .....            | 3               | 5            |
| Javanese language .....           | 4               | 5            |
| Soendan language .....            | 2               | 3            |
| Madoere language .....            | 2               | 3            |
| Baline language .....             | 2               | 3            |
| Makassa or Boegine language ..... | 2               | 3            |

There is a similar school in Leyden, and its programme includes very much the same subjects. No record for 1893.

The libraries of both institutions have been considerably enlarged by the purchase of new books and by numerous books presented.

| Provinces.....              | 18,446                          | 15,801   | 2,957                   | 2,319    | 21,403    | 18,120   |
| Communes .....              | 110,594                         | 94,172   | 2,231                   | 1,638    | 112,825   | 95,810   |
| General total .....         | 227,774                         | 156,982  | 10,816                  | 8,782    | 238,590   | 165,764  |
|                             |                                 |          |                         |          | 165,764   |          |
| Increase in four years..... |                                 |          |                         |          | 72,826    |          |

The State granted pensions to seven teachers in 1894, amounting to \$3,100 in all.

## XI. STATE TRAINING SCHOOLS FOR MIDWIVES.

[Regulated by the royal decree of July 27, 1882.]

There are two schools of this kind, (*a*) at Amsterdam, and (*b*) at Rotterdam. Thirty-five and 38 students were in attendance, of whom 24 were graduated at the close of the year. The Government expenditures amounted to \$5,927 and \$10,262 respectively; in 1889 to \$5,161 and \$10,034. Number of teachers employed, 8. Two hundred and forty-five patients were cared for during the year in these institutions.

## XII. THE STATE VETERINARY SCHOOL IN UTRECHT.

[Regulated by the law of July 8, 1874.]

This school was attended by 60 students; 25 were boarding and 35 day scholars. The course comprises four years. The commission granted a diploma of veterinary doctor to 12 candidates; 21, or 75 per

cent out of 28 students, attending the first and second years' course of study, were promoted to a higher class, and 15, or 48.4 per cent of 31 belonging to the third and fourth years' course of study, passed very successful transition examinations.

The museums of anatomy, natural history, and pathology, the laboratory, and various collections have been largely increased by new apparatus, instruments, models, etc. The library obtained 35 new works, besides 70 current periodicals and journals and works previously ordered.

An obstetric clinic for animals and a blacksmith forge belonging to the institution greatly facilitate practical studies.

The Government expenditures amounted to—

|                                   | 1893-94. | 1889-90. |
|-----------------------------------|----------|----------|
| Teachers and officials.....       | \$10,787 | \$10,053 |
| Superintendence of buildings..... | 5,045    | 5,063    |

| Total.....                        | 32,982   | 34,741   |
|                                   | 34,741   |          |
| Decrease in four years.....       | 1,759    |          |

The income of the veterinary school amounted to—

|  | 1893-94. | 1889-90. |
|--|----------|----------|
| Fees from students.....  | \$4,272  | \$5,160  |
| Fees from other sources.....   | 3,427    | 4,438    |
| Total.....   | 7,699    | 9,598    |
|  | 9,598    |          |
| Decrease in four years.....  | 1,899    |          |
| Total income from sources enumerated.....  | 7,699    | 9,598    |
| Total expenditures.....  | 32,982   | 34,741   |
| Excess of expenditures over income paid out of the treasury of the General Government..... | 25,283   | 25,143   |
|  | 25,143   |          |
| Increase in four years.....  | 140      |          |

The Netherlands report a goodly number of army and navy schools:

I. The higher military school opened a course in 1893-94 for lieutenants and lieutenant-quartermasters of the army. The course of military art was followed by 40 officers, and the course relating to the management of military affairs by 10 officers. The programme includes several East Indian languages.

II. A course for officers of hygiene at the military hospital in Utrecht, attended by 1 graduate of the State University of Leyden, 2 military druggists, 1 "military horse doctor," and 2 district veterinary physicians.

III. (A) The Royal Military Academy at Breda, regulated by the law of May 30, 1877 (Stbl. No. 141), etc., and sanctioned by the royal decree of August 11, 1883 (Stbl. No. 128). The course comprises four years.

The army school, having two divisions, is connected with the military academy, and is intended for the superior training of the lieutenants who were educated at the academy. The second division of this school is in The Hague, and is connected with the intendance course. Twenty-six lieutenants took part in the final examination of the first division.

The corps of cadets in the military academy numbered 254 students in the beginning of the school year; 176 were admitted to the examinations held in May, June, and July, 1894, and passed successfully. The teaching corps and officials, September 1, 1893, consisted of 39 military officers and 14 regular teachers.

Division II of the army school has 8 military teachers and 10 regular teachers.

(B) The artillery course in Delft is regulated by the royal decree of July 25, 1884 (No. 92), and of July 1, 1889 (No. 22). The course requires an attendance of three years. The number of volunteers was 20 on October 1, 1893. There were also 28 aspirant volunteers who submitted to a preliminary examination. Ten teachers are occupied.

(C) The military school of Haarlem, connected with a practical course, was attended by 49 infantry volunteers; 15 of these followed the preparatory practical course. There were 6 military teachers.

(D) Head courses at Kampen for second "grenadier" officers and light infantry. The attendance was 33 for home service, and 34 for the service in the East Indies in division 1. Division 2 embraces studies relating to military administration, with 16 and 12 students. Eleven military teachers and 3 regular teachers are in charge of the classes.

The Royal Military Academy at Breda is open only to young men who have passed a satisfactory examination at some higher burgher school at the end of a five-years course of study. The annual tuition fee is about \$150. The cadets in the Royal Military Academy can not enter the army, at home or abroad, before completing a four-years course of study in that institution. They enter the army as second lieutenants.

The military schools in Haarlem and Kampen are open to every boy above the age of 15 who is able to pass a primary examination. When these boys receive the rank of corporal in these schools they have the right to enter regiments in the home service or in the East Indies. Some of the students wait until they receive the rank of sergeant—some the rank of second lieutenant—before entering the regiments. These two institutions furnish tuition, board, and clothes, including uniforms, without cost to the student.

IV. The institutions for the training of cadets and officers and non-commissioned officers include:

(A) The school for cadets with a teaching corps of 12 officers of the army and 5 regular teachers, besides 1 captain and 4 lieutenants; 195 aspirant cadets were examined for the course in 1893-94; 45 were physically unfit for the service, and a total of 50 were admitted to the school with the rank of cadet.

(B) Courses for heavy armed and light infantry; 60 attending the first years' course, and 168 the second.

V. (A) The pupil school at Nieuwersluis, with 173 boys enrolled in July, 1893, 24 more entered during the year, while 91 left to join some company. These boys are children of soldiers, officers, Government officials. They are instructed by 4 teachers under the supervision of the director.

(B) The instruction battalion, with 3 classes, followed by 394 volunteers, October, 1893. In July, 1894, there were 499.

(C) The artillery instruction company, with 3 classes and 211 volunteers, on July 1, 1893.

(D) Instruction battery, with 75 volunteers, among these 31 titular corporals.

VI. Domestic schools for the various corps of the army, attended by an average number of 4,118; 944 of these learned to read and write well or tolerably well, 640 to write, and 515 to read.

All the above-named schools are intended for the training of young men as officers for the home service or the colonies; lieutenants of the artillery and engineering corps, superior officers, volunteers, lieutenants of infantry, young cadets, titular corporals, quartermasters, and sergeants, etc.

The naval schools include:

(A) The Royal Institution of Marine at Willemsoord, with Divisions I and II, these comprising a four-years course. Ninety-three midshipmen students were enrolled. The result of the examinations for promotions was very favorable for the year. The age of the applicants for admission must be 14 to 17 years. The entire tuition fee is \$643 or \$482, according to grade. The aim of this institution is to train young men for officers in the navy. The corps of teachers consists of 8 naval officers and 8 regular teachers. One library and several laboratories belong to the school.

(B) The training course for boys on board of the revenue cutter at Hellevoetsluis. The engineer apprentices numbered 18 in the upper division and 17 in the lower, October, 1893. Six teachers were engaged.

(C) Training of pilot apprentices on board the revenue cutter at Amsterdam. Eleven in each division; total, 22.

(D) Training course for boys as boatswains on board the instruction corvette *Nautilus*, at Hellevoetsluis, with 55 boatswain apprentices, 7 sailors of the third class, and 1 lighterman (apprentices) in division 1, 30 sailors of the third class and 47 lightermen (apprentices) in division 2.

(E) Training course for boys on board of instruction ship *Admiral van Wassenaer*. The winter course, October, 1893, commenced with 680 pupils. They are trained for second officers and inferior ranks in the navy.

VII. Training course of military pharmacists for the army of the East and West Indies. The course opened with 5 students.

According to an investigation ordered by the departement van oorlog (war department), we find that the total body of men who were incorporated in the land militia of the Netherlands numbered, 1893, 11,016; 1889, 10,735:

|                                   | 1893-94. |           | 1889-90. |           |
|-----------------------------------|----------|-----------|----------|-----------|
|                                   | Number.  | Per cent. | Number.  | Per cent. |
| Could read and write .....        | 10,289   | 93.40     | 9,826    | 91.53     |
| Could only read.....              | 115      | 1.04      | 137      | 1.28      |
| Could neither read nor write..... | 612      | 5.56      | 772      | 7.19      |

A similar investigation was ordered by the departement van marine (navy department) in regard to those incorporated in the sea militia. The results show that of 600 in both years mentioned above:

|                                   | 1893-94. |           | 1889-90. |           |
|-----------------------------------|----------|-----------|----------|-----------|
|                                   | Number.  | Per cent. | Number.  | Per cent. |
| Could read and write .....        | 578      | 96.3      | 559      | 93.1      |
| Could only read.....              | 3        | .5        | 14       | 23.3      |
| Could neither read nor write..... | 19       | 3.3       | 27       | 45        |

The lower courses of the above-named institutions include reading, writing, and the four fundamental rules of arithmetic, to read the time by the watch, rudiments of geography of the Netherlands, rudiments of national history regarding the marine and theoretical and practical instruction in the rudiments of the profession.

The military schools embrace in their programme all subjects that are appropriate for the respective branches, the lower grades including primary subjects.

*Review of the different classes of secondary schools—the number of pupils and teachers in 1889-90 and 1893-94.*

|  | Teachers and professors. |          | Pupils and students. |            |

The excess of the total expenditures over the income derived from fees, \$8,442,594, was provided for out of the communal treasury.

#### SUPERIOR INSTRUCTION (HOOGER ONDERWIJS).

The present system of higher instruction is based upon the law of April 28, 1876, amended and modified by laws of May 7, 1878; June 28, 1881; June 15, 1883, and July 23, 1885.

Institutions of higher instruction are divided into public and private. Public, are those established and maintained by communes and the

State, separately and conjointly. All other institutions are called private, or "bijzondere," schools. Under article 192 of the fundamental law, any person may teach the higher branches, subject to supervision by the proper authority.

Foreigners must obtain a permit from the King before they can be employed as teachers of the higher branches, in either public or private institutions.

Public higher instruction is provided for and taught in three State universities—in the gymnasia and progymnasia, and in the Communal University of Amsterdam.

The "gymnasia" and Latin schools correspond to the German gymnasium, while the courses given at the denominational "seminaria" and other superior institutions of this kind answer to the universities; but only the latter can confer academic degrees.

#### STATE UNIVERSITIES.

By the royal decree of February 17, 1890, the corps of officials at these universities was made to conform to the decrees of February 8, 1889, and February 16, 1889.

*State University of Leyden* (with 5 faculties).—The college of curators consists of 5 members.

The senate is composed of 7 members, all being professors, namely, 1 rector, 1 secretary and 4 assessors, 1 archivist. Each faculty has 1 chairman and 1 secretary; in all, 10 members, with the title of professor.

This university had 47 professors. In the faculty of theology, 5; of law, 8; of medicine, 9; of mathematics and natural sciences, 11; of letters and philosophy, 14. There were also 3 lecturers and 9 private tutors, or a total force of 59 teachers.

*State University of Utrecht* (with 5 faculties).—The college of curators consists of 6 members. The senate is composed of 6 members, viz: One rector, 1 secretary and 3 assessors, 1 archivist.

Each faculty has 1 chairman and 1 secretary, all having the title of professor.

The corps of teachers comprises 37 professors. In the faculty of theology, 4; of law, 6; of medicine, 10; of mathematics and natural sciences, 10; of letters and philosophy, 7. To this number must be added 4 lecturers and 9 private tutors (docents), which gives a general total of 50.

*State University of Groningen*.—The college of curators consists of 6 members. The senate is composed of 7 members; 1 rector, 1 secretary, and 5 assessors.

Each faculty has 1 chairman and 1 secretary, all having the title of professor.

The University of Groningen embraces the faculties of theology, law, medicine, mathematical and natural sciences, and of letters and philosophy.

The corps of professors comprises 35 members. For the faculty of theology, 4; of law, 4; of medicine, 8; of mathematics and natural sciences, 9; and of letters and philosophy, 10. There were also lecturers and assistants, making a general total of 40.

On reaching the age of 70, the professors in the universities are pensioned. The amount of their pension is determined by the number of years they have taught, but can never exceed the sum of \$1,206 per annum. The professors in the Catholic institutions are also pensioned by the Government, and their pensions equal the salary of a Catholic priest.

If the professors fail to perform their duties in a satisfactory manner, the minister of the interior may suspend them for a period of five weeks. Serious misdemeanor might be punished by removal from office.

The curators, through the secretaries of the faculties, make detailed reports to the minister of the interior on all subjects connected with the universities. They do not receive a permanent salary for the performance of their duties, but are allowed by the Government \$3 per day when they are actually engaged in the performance of their duty (30 cents per hour when traveling and expenses incurred for board and lodging).

The curators report, on November 1 of each year, to the minister of the interior, making an estimate of the expenses for the coming year; and in accordance with this statement the minister requests the sum needed, which is paid out of the State treasury from moneys derived from the general revenue taxes of the country.

*a* This number includes 18 Germans and 1 Hungarian.

*b* Including 16 ladies.

Increase in four years, 138 students.

The Government grants six beneficiary scholarships in each of the universities to young men who have distinguished themselves in their former studies, the university receiving from the State \$320 for each student in annual installments for the complete course. These moneys are derived from ecclesiastical funds that are realized from ancient estates which formerly—before the Reformation in 1517—were used for the installation of a Pope or bishop, but since the Reformation the Sovereign or Government has taken possession of these funds, which are

now disbursed by nonofficials or by committees under the direct supervision of the State.

Students who receive financial assistance from the Government are at liberty to select any of the courses of study allowed in the university.

In order to present a correct idea of the studies pursued in a Dutch university, the following table, presenting a series of lectures and lessons for 1889-90, is given:

*University of Leyden.*

| Lecture or lesson.  | Number of hours during week. | Average number of hearers. | Lecture or lesson.   | Number of hours during week. | Average number of hearers. |

The library of the University of Leyden received during the year 1893 200 new works, 1,056 copies of dissertations from France, and 3,341 essays from German, Swiss, Norwegian, and other universities. In exchange, 1,540 dissertations of the university were sent out. There were presented from the different departments of the country 126 books and 30 charts; from private parties, 581 books; from corporations and colleges, 586. Other parties donated 256 books, 63 periodicals, etc. Thirteen thousand five hundred books and 55 manuscripts were loaned from the library.

One thousand five hundred and forty-six patients were cared for in the hospital that is connected with the university; visitors in the polyclinic numbered 10,154.

The University of Leiden has, moreover, the following: Cabinet of medals and coins; anatomical cabinet; physical cabinet; chemical laboratory; inorganic specimen division; zootomic laboratory; hortus; historical laboratory; herbarium; museum of natural history; geological and mineralogical museum; physiological laboratory; pharmaceutical laboratory; pathological anatomie laboratory; ethnographic museum; observatory; museum of antiquities.

The library of the University of Utrecht received an addition of 788 new works, 307 by purchase, 243 by exchange, and 238 were presented, to say nothing of periodicals, journals, academic essays, etc. Nine thousand four hundred and eighty-seven books were loaned from this library during the year.

Two thousand two hundred and forty-four patients were treated in the medical clinic and polyclinic of the hospital connected with the university. Four hundred and nine and 2,150 patients were treated in the surgical clinic and polyclinic, respectively; over 2,400 persons in the dental division; 83 and 255 were treated by Professor Halbertsma in the gynæcological clinic and polyclinic, respectively; and 131 and 835 patients in the obstetric clinic and polyclinic, respectively.

The University of Utrecht owns besides a pathological institute, institute of anatomy, physiological laboratory, hygienic institute, phys-

ical laboratory, museum of natural history, mineralogical and geological institute, medical laboratory, pharmaceutical laboratory; botanic garden; observatory.

The additions to the library of the University of Groningen consisted of 466 new works; 354 of these were purchased and 112 presented, besides pamphlets, dissertations, etc. Visitors numbered 7,702 persons, and 8,367 books were loaned during the year.

The University of Groningen owns, moreover, a hospital, in which, on January 1, 1893, there were 112 patients under treatment, 965 having entered during the year; a cabinet of anatomy; physiological laboratory; pharmacological and hygienic laboratory; cabinet for physics; botanic garden; museum of natural history; medical laboratory; mineralogical and geological laboratory; pharmaceutical laboratory; collection of astronomical instruments; collection of engravings; and a collection of mathematical models.

University of Amsterdam, supported by the communes. By article 36, relating to superior instruction, the community of Amsterdam obtained a concession elevating the "Athenæum Illustre" to a university. This was done October 15, 1887, and it has now the same privileges as the State universities.

The college of curators consists of 2 members.

*Corps of professors.*—The senate consists of 1 rector-magnificus, 1 secretary, and 4 assessors. The professors of the faculties are distributed as follows: Of law, 7; of medicine, 14; of mathematics and natural sciences, 11; of letters and philosophy, 11; of theology, 6; public lecturers, 3; and private lecturers, 13. This gives a general total of 65.

*Students, 1893-94.*

The university received in 1889 a donation of \$16,080 from Mr. Rudolph Lehman to build a lecture hall.

*Library.*—The number of books has been largely increased. The central commission on statistics presented a collection of statistical works. A total of 3,787 works were entered in the accession book; the periodicals increased considerably also.

Thirteen thousand eight hundred and thirty-four books were loaned and consulted, and 107 manuscripts were consulted and 36 loaned. The visitors numbered 25,369, the largest number per day being 170.

The university has a pathological laboratory; hortus botanicus; geographic-geological cabinet; laboratory and collection for the study of pathological dissections; hygienic laboratory; chemical-pharmaceutical laboratory; laboratory and collection of zoological specimens; physiological laboratory; laboratory for physics; laboratory for experimental plant physiology; anatomic laboratory; museum "Urolik;" chirurgic museum; experimental chirurgic museums.

From the *Revue Internationale de l'Enseignement*, January, 1893, we learn that the medical studies in the universities of Holland will soon undergo a reform which the Government has had in contemplation for some time. Up to this date there have been four ways open to students desirous of qualifying for the medical profession, though there is but one course by which they can attain the degree of doctor of medicine. All such as desire this honor must first graduate from a gymnasium, and must have taken the university course; all others passing State examinations only can obtain a diploma in medicine, but can not assume the title of doctor. Before passing the State examinations, however, students are required to be in possession of a diploma of efficiency from a middle school (*hoogere burgherschool*) with a five years course; a diploma of promotion to the fifth year of a gymnasium, or a diploma proving they have passed a satisfactory examination in literature and mathematics.

From January 1, 1894, the two latter courses will be closed. Thus, after December, 1893, these examinations in medicine can not be taken unless the candidate has a diploma either from a gymnasium or from a

middle school certifying a five years course, but the conditions necessary for the degree of M. D. will remain as at present.

The same law regulates the qualification of foreign students in medicine. They will hereafter be admitted to the practice of medicine in the Netherlands and its colonies after having proved the validity of their foreign diplomas by an examination passed in the Dutch language. This is required in order to ascertain whether they know Hollandish well enough to understand their patients.

*Gymnasia*.—One of these institutions is in operation in each of the 29 (30 in 1889) principal cities, and of these 25 received subsidies from the State. Gymnastics and Hebrew are not obligatory, and special fees from \$12 to \$40 are charged for these branches. These schools prepare for the universities.

Total teachers, 431; 216 doctors, 49 candidates, 143 having teachers' diplomas of secondary instruction, 10 teachers with a diploma of superior instruction, in conformity with the clause of the law, and 13 teachers having a diploma of secondary instruction, in conformity with the clause of the law. There were 427 teachers employed in 1889.

The salary of a rector ranged from \$1,045 to \$2,010. The lowest salary paid to a rector of a "gymnasia" was \$1,045, but the incumbent had free residence. These teachers, however, draw an additional salary from burgher day or evening schools, higher burgher schools, middle schools for girls, or institutions for the training of teachers, wherever they may be employed. These additional salaries range from \$200 to \$400. Income from private institutions have not been taken into consideration.

|-------------------|-------------|-------------|-------------|-------------|
|                   | Jan., 1894. | Jan., 1890. | Jan., 1894. | Jan., 1890. |
| Gymnasia .....    | 2,515       | 2,502       | 16          | 27          |
| Progymnasia ..... |             | 7           |             | 5           |
| Total .....       | 2,515       | 2,509       | 16          | 32          |

There were, according to the foregoing figures, 6 students more and 16 hearers less in attendance in January, 1894, than in January, 1890.

*Examinations*.—Six hundred and forty-six candidates were examined for admission; of this number, 490 were admitted to the lowest class; 150 to higher classes, and 40 failed. At the final examination, at the close of the year, 1,733 students were transferred, 368 remained in the same class, and 6 withdrew.

[At 29 "gymnasia" (30 in 1889).]

New gymnasia buildings have been erected at Arnheim, Delft, Gonda, and Leeuwarden since 1889. The general conditions and accessories for instruction of all gymnasia are very satisfactory and constantly improving.

*Private superior instruction.*—(a) The Free University of Amsterdam has a director, the incumbent being in 1893 C. M. E. van Löben Sels. (b) The college of curators is composed of 2 members; 1 rector and 7 professors are employed as teachers. (c) The total number of students during the year amounted to 85, registered as follows: Fifty-seven in the faculty of theology; 3 in the faculty of theology and law; 3 in the faculty of theology and letters; 12 in the faculty of law; and 10 in the faculty of letters. Eighty students in 1889.

The library received various new works.

The following examinations were passed: Five with a degree of candidate of divinity; 2 with a degree of candidate in the faculty of letters; 1 first examination for doctor's degree; 11 propædæutic examinations in theology, and 1 in law.

Besides the Free University of Amsterdam, there are about 26 denominational private institutions for superior instruction in other parts of Holland, some of which receive subsidies from the State.

They are designated as follows: (1) Seminaries, (2) colleges, (3) Latin schools, (4) training schools.

The aim of most of these institutions is the training of young men for ministers in their respective churches, and for teachers of higher branches.

In 1893 there were 3,774 students enrolled in 26 of these denominational institutions. The number of teachers can not be ascertained with accuracy, but was about 317. Total students in 1889, 1,996. This shows an increase in four years of 1,778 students.

The following is a review of the consolidated expenditures for higher instruction after deducting the subsidies paid by the General Government and provinces from the expenditures of the communes, and of the income from the school fees, etc., from 1878 to 1893, inclusive:

| Year.     | Income from school fees, graduation, etc. | Expenditures. | Year.       | Income from school fees, graduation, etc. | Expenditures. |
|-----------|---|---------------|-------------|---|---------------|
| 1878..... | \$142, 591                                | \$691, 214    | 1887.....   | \$210, 985                                | \$982, 144    |
| 1879..... | 155, 110                                  | 819, 738      | 1888.....   | 216, 351                                  | 1, 024, 106   |
| 1880..... | 159, 582                                  | 933, 402      | 1889.....   | 223, 452                                  | 1, 025, 573   |
| 1881..... | 185, 457                                  | 956, 651      | 1890.....   | 228, 878                                  | 1, 072, 172   |
| 1882..... | 183, 271                                  | 918, 631      | 1891.....   | 232, 083                                  | 1, 111, 240   |
| 1883..... | 181, 763                                  | 1, 026, 416   | 1892.....   | 233, 927                                  | 1, 136, 339   |
| 1884..... | 180, 975                                  | 1, 042, 821   | 1893.....   | 233, 982                                  | 1, 123, 479   |
| 1885..... | 191, 017                                  | 978, 765      |             |   |               |
| 1886..... | 204, 177                                  | 980, 026      | Total ..... | 3, 163, 601                               | 15, 872, 717  |

The excess of the total expenditure over the income, \$12,709,116, was provided for out of the respective treasuries of the communes and provinces or out of the treasury of the General Government.

*Summary of all expenditures of the General Government, of the provinces, and of the communes for public higher, secondary, and primary instruction, and of income from these schools as given in previous tables.*

## EXPENDITURES.

|  | General Government. |             | Provinces. <i>a</i> |          | Communes.   |             | Total.       |             |
|--|---------------------|-------------|---------------------|----------|-------------|-------------|--------------|-------------|

## RECAPITULATION.

|   | 1893-94.    | 1889-90.    |
|---|-------------|-------------|
| From balance of expenditure over income paid by General Government... | \$3,581,700 | \$2,807,832 |
| From balance paid by province.....                                    | 25,423      | 22,141      |
| From balance paid by communes.....                                    | 4,020,736   | 3,426,643   |
| Total.....  | 7,627,859   | 6,256,616   |
| Total expenditures.....   | 10,527,354  | 8,795,690   |

*a* Subsidies to the communes and contributions to the Government, such as the amounts withheld from salaries by the Government for the pensions of teachers, special sums contributed to the communes, etc., have been included in the foregoing table, except the subsidy for drawing and industrial schools.

After consolidating the expenditures of Government, provinces, and communes; that is, after deducting the subsidies of the Government and provinces that have been included in the expenditures of the communes for public education, the expenses incurred between communes for transferred pupils to neighboring schools in other communes, the special funds that were raised by the communes for educational purposes, the teachers' contributions toward their pensions, and the unexpended balance of subsidy funds covered back into the Government treasury, the tables of expenditure and income for the years 1889-90 and 1893-94 read as follows:

*Actual sums that were paid out of the general treasury of the Government or out of the treasury of the provinces and communes.*

## EXPENDITURES.

|   | General Govern-<br>ment. |           | Provinces. |          | Communes. |           | Total.    |           |

| For veterinary school.....  | 32,982                   | 34,742    | .....      | .....    | .....     | .....     | 32,982    | 34,742    |
| For training schools for midwives.....                            | 16,198                   | 15,195    | .....      | .....    | .....     | .....     | 16,198    | 15,195    |
| For primary instruction.....                                      | 2,291,509                | 1,764,236 | .....      | .....    | 3,911,822 | 3,296,317 | 6,203,331 | 5,060,553 |
| Total.....  | 3,678,397                | 2,935,074 | 25,423     | 22,141   | 4,944,971 | 4,229,159 | 8,648,790 | 7,186,374 |

*Actual sums that were paid out of the general treasury of the Government, etc.—Cont'd.*

INCOME.

|   | General Government. |          | Communes. |          | Total.    |           |
|---|---------------------|----------|-----------|----------|-----------|-----------|
|   | 1893-94.            | 1889-90. | 1893-94.  | 1889-90. | 1893-94.  | 1889-90.  |
| From universities (tuition fees).....                     | \$93,997            | \$91,009 | \$53,438  | \$47,093 | \$147,435 | \$138,102 |
| From gymnasia and Latin schools (tuition fees) .....      |                     |          | 86,547    | 85,348   | 86,547    | 85,348    |
| From secondary instruction (tuition fees, diplomas) ..... | 45,621              | 37,539   | 150,450   | 116,693  | 196,071   | 154,232   |
| From veterinary school (tuition fees) ..                  | 7,699               | 9,599    |           |          | 7,699     | 9,599     |
| From primary instruction (tuition fees) .....             | 17,298              | 5,706    | 633,801   | 553,383  | 651,099   | 559,089   |
| Total .....   | 164,615             | 143,853  | 924,236   | 802,517  | 1,088,851 | 916,370   |

*a* This sum includes \$12,253 derived from examination fees and \$5,045 from tuition fees.

After subtracting the income of the various educational institutions, derived from fees for diplomas and tuition, from the actual expenditures of the Government, provinces, and communes, we obtain the following result:

|  | 1893-94.    | 1889-90.  |
|--|-------------|-----------|
| Total income.....  | \$1,088,851 | \$946,370 |
| Actual expenditures.....                                       | 8,648,791   | 7,186,374 |
| Excess of expenditure over income from enumerated sources..... | 7,559,940   | 6,240,004 |
| Increase in 4 years.....                                       | 1,319,945   |           |

These sums were paid out of the respective treasuries of the General Government, provinces, and communes.

There are no special school taxes raised in the Netherlands, and all funds for education in that country are taken from the general taxes imposed by the Government and provinces, or from the local taxes of the communes.

Communes that are unable to support the necessary number of schools send in a petition to the "Gedeputeerde Staten" (legislative body of the Kingdom), who refer it to the minister of the interior, and in case of his approbation a subsidy or loan may be granted out of the general treasury of the Government. The principal proportion of expenses for the communal schools is paid by the city treasurers from local taxes.

## CHAPTER XII.

### EDUCATION IN ITALY.

---

TOPICAL OUTLINE: *Public instruction in Italy, by Dr. Egisto Rossi (with statistics for 1861-1890)—Statistics to 1892-93—Tabulated statistics of universities (1893-94 and 1894-95 compared), by Prof. Carlo F. Ferraris—The Catholic school system of Rome, extracts from an article by Cardinal Satolli—Schools of Leghorn in 1893, by the United States consul—Current educational movements, 1890-1895—Scientific and professional organizations in consular district of Rome to 1891, by the United States consul-general—Memorable dates in Italian history—Index to education in Italy, from former reports of the Commissioner of Education.*

*Area, population, and administrative divisions.*—Area, 110,623 square miles; population, 30,724,897 (estimated December 31, 1893); capital, Rome; population, 451,000 in 1893; minister of public instruction, Commendatore Guido Baccelli. The administrative divisions consist of 69 provinces, of which 60 are divided into territories and (the province of Mantua and the 8 provinces of Venetia) into districts. The territories (circondari) number 197, and there are 87 districts (distretti). These again are divided into communes (comuni), numbering 8,259 in 1881 and 8,258 in October, 1894.

*Educational summary.*—With a population of 30,724,897 in 1893 there were 11 per cent of pupils in schools below the universities. Of the total (3,106,852) about 96 per cent were in elementary schools and 3 per cent in secondary schools. In higher institutions the percentage was 0.6; in special schools, 1.1 per cent. Per capita of enrollment in elementary schools, \$4.09; per capita of population, 39 cents.

The administrative and educational authorities are brought closely together in their duties, as is shown in the statements appended. The State, province, or commune maintains public instruction; a member of the cabinet is in charge of education; the King himself appoints certain grades of instructors; the parliamentary bodies discuss and decide upon educational questions; the prefect of the province is president of the provincial school council; the syndic looks after the registration of pupils of school age, notifies parents of neglect of duty, etc.

#### PUBLIC INSTRUCTION IN ITALY.<sup>1</sup>

By DR. EGISTO ROSSI,<sup>2</sup> *Rome, Italy.*

Public instruction in Italy is regulated by law of November 13, 1859. This law has been modified, however, by royal decrees and by later laws.

---

<sup>1</sup>Prepared for the International Congress of Education of the World's Columbian Exposition, Chicago, July 25-28, 1893, and printed in part in the "Addresses and Proceedings of the International Congress of Education," pp. 907-911.

<sup>2</sup>Dr. Rossi is the author of a volume on education in the United States—"La Istruzione Pubblica negli Stati Uniti, Roma, 1889," pp. 144.

The educational system<sup>1</sup> comprises three grades—elementary, secondary (including classical and technical schools), and superior. There are also infant schools which aim to give the rudiments of an education to children between 3 and 6 years of age, the latter being the earliest age at which children are admitted to the primary grades.

Private individuals of known character and capability are permitted to open infant schools and those of elementary and secondary grades, providing the localities in which the schools are to be opened are satisfactory from a hygienic point of view to the authorities.

#### INFANT SCHOOLS.

The compulsory education laws do not apply to the infant schools. These are founded by the communes, by corporations, associations, and private individuals. Many of them are autonomous in character, possessing their own revenues, which accrue from perpetual funds and donations. Other schools are supported entirely by the individuals or corporations founding them.

Almost all these schools receive subsidies from the commune, provinces, and the State, in addition to the funds received from the sources mentioned above. The children receive gratuitous instruction in the majority of infant schools; in a few a small fee is charged, the means of the family being taken into consideration in making such charges. In 1889 the communes gave \$317,532 to the infant schools, the State \$8,685.

The number of infant schools and of children attending them is enumerated in the following table:

*Infant schools.(a)*

| Year.      | Schools.                   |  |          |        | Pupils.  |
|------------|----------------------------|--|----------|--------|----------|
|            | Public.                    |  | Private. | Total. |          |
|            | Having their own revenues. | Supported by com-<br>munes or by corporate bodies. |          |        |          |
| 1862 ..... |                            |  |          | 1, 673 | 71, 054  |
| 1872 ..... |                            |  |          | 1, 099 | 130, 806 |
| 1877 ..... |                            |  |          | 1, 287 | 117, 078 |
| 1882 ..... |                            |  |          | 2, 516 | 243, 972 |
| 1886 ..... | 976                        | 513  | 650      | 2, 139 | 252, 763 |
| 1887 ..... | 1, 021                     | 532  | 671      | 2, 224 | 258, 838 |
| 1888 ..... | 1, 055                     | 539  | 624      | 2, 218 | 261, 506 |
| 1889 ..... | 1, 081                     | 537  | 602      | 2, 220 | 268, 186 |
| 1890 ..... | 1, 118                     | 596  | 582      | 2, 296 | 278, 204 |

<sup>a</sup>The Annuario Statistico Italiano, 1895, gives 2,572 infant schools in 1,776 communes, with 302,754 children and 6,488 teachers and directors, in 1893.

<sup>1</sup>Statistics to date of 1892-93 or to 1891-92 are added, in form of note, to this presentation. They are taken from the "Annuario Statistico Italiano, 1895," published by the "Ministero di Agricoltura, Industria e Commercio. Direzione generale della Statistica, Roma, 1896."

## ELEMENTARY SCHOOLS.

The elementary schools are in charge of the communes and are under the supervision of their administrative officers. In conformity with the law they are gratuitous and are maintained by subsidies from provincial and communal funds. In accordance with special laws, the State aids in such support by subsidies for construction and repairs and for teachers' salaries. The State is authorized to favor communes which are too impoverished to construct school buildings by granting subsidies for such buildings, or by extending other aid, either by loan or gift, if there is any special reason for so doing. If any loans have been made the State undertakes to reimburse the institution loaning said fund, adding thereto a nominal interest.

The elementary schools are frequented by children from 6 to 12 years of age. These schools are divided into two grades; the lower grade, which extends through three years, is subdivided into two classes, equivalent to a two-years course. The course of study includes writing, elementary arithmetic and the metric system, history of Italy, elements of geography, natural history and physics, civic education, and gymnastics.

All the communes are required to establish lower grade elementary schools; communes of 4,000 inhabitants and over are required to establish those of the higher grade. In these larger communes there must also be institutions of a secondary grade.

By law of July 15, 1877, which carried out the provisions of the law of 1859, parents were obliged to send their children between 6 and 9 years of age to the elementary grades, unless they could show cause for instruction at home or in private schools. This compulsory act could be carried on beyond the ninth year if the pupil, when called up for examination at close of the course, did not indicate satisfactory knowledge of the studies in the lower grade elementary schools.

By decree of February 16, 1888, pupils of both public and private schools, and those who obtain home instruction, must receive certificates of having passed such final examinations before they can be placed on the registration list for the holding of political or administrative office. Parents and guardians who fail to conform to the above regulations are subject to censure from the syndic, and, in case of further noncompliance, they are subject to a fine of not less than \$2.50.

By law of July 15, 1877, which went into force in October, 1877, each commune is required to have a certain number of teachers trained for duty in these lower grade elementary schools. This number is to be proportionate to the population.

The following table indicates the number of communes from 1861-62 to 1889-90 which have fulfilled the requirements of the law of July 15, 1877, as far as the number of schools, pupils, and teachers is concerned:

| Year.   | Popu-<br>lation. | Communes having compulsory<br>education. | Teachers, assistant<br>teachers,<br>and substitute teachers. | Class rooms.    |                  |        | Enrollment.                    |                                 |                 | Ratio.                                      |                                    |   |                                   |                                    |
|---------|------------------|--|--|-----------------|------------------|--------|--------------------------------|---------------------------------|-----------------|---|------------------------------------|---|-----------------------------------|------------------------------------|
|         |                  |  |  | Lower<br>grade. | Higher<br>grade. | Total. | In lower elementary<br>grades. | In higher elementary<br>grades. | Total. <i>a</i> | Number of<br>schools to 100<br>inhabitants. |                                    | Number en-<br>rolled to 100<br>inhabitants. |                                   |                                    |
|         |                  |  |  |                 |                  |        |                                |                                 |                 | In lower<br>elementary<br>grades.           | In higher<br>elementary<br>grades. | Total.                                      | In lower<br>elementary<br>grades. | In higher<br>elementary<br>grades. |
| 1861-62 | 21,777,334       | 21,050                                   | 21,353   | 21,353          | 21,353           | 21,353 | 885,152                        | 0.98                            | 4.06            |   |                                    |   |                                   |                                    |
| 1865-66 | 21,777,334       | 26,019                                   | 25,682   | 25,682          | 25,682           | 25,682 | 1,098,721                      | 1.18                            | 5.04            |   |                                    |   |                                   |                                    |
| 1870-71 | 26,801,154       | 33,290                                   | 32,782   | 32,782          | 32,782           | 32,782 | 1,458,884                      | 1.22                            | 5.44            |   |                                    |   |                                   |                                    |
| 1875-76 | 26,801,154       | 37,623                                   | 38,255   | 38,255          | 38,255           | 38,255 | 1,722,669                      | 1.43                            | 6.43            |   |                                    |   |                                   |                                    |
| 1880-81 | 28,459,628       | 7,804                                    | 42,510   | 42,510          | 42,510           | 42,510 | 1,928,706                      | 1.49                            | 6.78            |   |                                    |   |                                   |                                    |
| 1885-86 | 29,639,785       | 8,178                                    | 47,026   | 41,023          | 5,050            | 46,073 | 1,949,038                      | 1.38                            | 6.99            |   |                                    |   |                                   |                                    |
| 1886-87 | 29,942,142       | 8,178                                    | 47,449   | 41,448          | 5,137            | 46,585 | 1,970,552                      | 1.39                            | 7.03            |   |                                    |   |                                   |                                    |
| 1887-88 | 30,266,056       | 8,178                                    | 47,998   | 41,913          | 5,334            | 47,247 | 1,985,436                      | 1.38                            | 7.02            |   |                                    |   |                                   |                                    |
| 1888-89 | 30,565,188       | 8,226                                    | 48,569   | 42,305          | 5,267            | 47,572 | 2,002,957                      | 1.39                            | 7.02            |   |                                    |   |                                   |                                    |
| 1889-90 | 30,946,317       | 8,253                                    | 49,366   | 42,837          | 5,361            | 48,198 | 2,047,671                      | 1.39                            | 7.07            |   |                                    |   |                                   |                                    |

*a* In 1892-93 (vide *Annuario Statistico Italiano*, 1895) there were 2,487,803 pupils in public and private schools of an elementary grade (boys, 1,311,018; girls, 1,176,785); class rooms, 58,277; teachers, 60,380.

The ratio of schools, teachers, and pupils to population is based in the years 1861-62 to 1865-66 upon the census of December 31, 1861; that of 1870-71 to 1875-76, upon the census of December 31, 1871, and that of 1880-81, upon the census of December 31, 1881. The reports presented for the other years mentioned in the table are based upon an estimate of population made annually in the month of December following the opening of the schools. The estimate of population is formulated upon the basis of December, 1881, adding to it the births in each year and subtracting the deaths. No attention being paid to the movement of population, i. e., the immigration and emigration, such a determination is liable to error, and such errors increase in proportion to the time that has elapsed from the date of the original census. The movement from one commune to another exercises but little influence upon the territorial department to which it belongs, and less upon the total for the Kingdom. On the other hand, the emigration to foreign shores must not be overlooked in so far as it appertains to the whole Kingdom. It is fairly easy to take note of the emigration, but the means approximating the immigration and the return of Italians to their native country is less easy. The estimates relative to the movement of population, as, for example, the estimates of mortality, by province and by territory (*circondari*), and also in the largest cities, taken one by one, necessitate that calculations appertaining to the

population of these subdivisions be made at least approximately, and yet the population is calculated on the supposition that the increase from year to year is in the same proportion as the augmentation during the period between the last two censuses.

Proceeding, then, by this method it is found that the population on December 31, 1889, would be 29,969,654, while if the excess of the births over the deaths were added between the dates 1882-1889 to the population of 1881, the result would be 30,946,317, which exceeds by more than 1,000,000 the number estimated by the first method.

The increase in the number of elementary schools and in enrollment was more rapid during the period which followed the formation of the Kingdom of Italy than it is to-day.

The ratio of increase is as follows:

| Period.                  | Increase of pupils to 100 inhabitants. | Increase of pupils in respect to population. |
|--------------------------|--|--|
| 1861-62 to 1867-68 ..... | 5.32                                   | 4.45   |
| 1867-68 to 1871-72 ..... | 3.30                                   | 2.71   |
| 1871-72 to 1889-90 ..... | 2.06                                   | 1.23   |

There are also elementary, evening, holiday, and adult schools supplementary to the public day schools. It is not considered obligatory upon the communes to support many of these schools; the number is quite large, however, and most of them receive subsidies. The number of the evening and holiday schools, with their enrollment, is here presented for certain years between 1861-62 and 1889-90:

*Evening and holiday schools. (a)*

| Year.         | Evening schools. |           | Holiday schools. |           |
|---------------|------------------|-----------|------------------|-----------|
|               | Class rooms.     | Enrolled. | Class rooms.     | Enrolled. |
| 1861-62 ..... | 2,803            | 108,170   | 495              | 16,031    |
| 1871-72 ..... | 9,809            | 375,947   | 4,743            | 154,585   |
| 1877-78 ..... | 10,577           | 432,801   | 5,792            | 195,631   |
| 1882-83 ..... | 6,787            | 278,377   | 3,831            | 120,110   |
| 1887-88 ..... | 5,622            | 205,160   | 3,965            | 113,188   |
| 1888-89 ..... | 5,191            | 191,600   | 3,625            | 100,150   |
| 1889-90 ..... | 5,265            | 196,846   | 3,574            | 100,002   |

*a* Statistics of evening schools in 1892-93: Class rooms, 3,492; teachers, 3,639; pupils, 128,780 (boys, 124,789; girls, 3,991). Holiday schools: Class rooms, 2,454; teachers, 2,507; pupils, 64,580 (boys, 15,086; girls, 49,494).

The increase in the number of schools and pupils is of significance as tending to account for the decrease of illiteracy shown by the three successive censuses as that illiteracy bears upon the total population, the various classes, and the age. At least, it bears upon the number of recruits and illiterate married people to every 100

examined and upon the number of married men and married women respectively.

| Year.      | Native recruits who could not read to 100 examined. | Married men and women who could not write their names. |        | Illiteracy to 100 inhabitants. |         |                       |         |
|------------|---|--|--------|--------------------------------|---------|-----------------------|---------|
|            |   |  |        | From 6 years upward.           |         | From 20 years upward. |         |
|            |   | Men.   | Women. | Male.                          | Female. | Male.                 | Female. |
| 1861 ..... |   |  |        | 68                             | 81      | 65                    | 82      |
| 1866 ..... | 64  | 60   | 79     |                                |         |                       |         |
| 1871 ..... | 57  | 58   | 77     | 62                             | 76      | 60                    | 77      |
| 1876 ..... | 52  | 52   | 73     |                                |         |                       |         |
| 1881 ..... | 48  | 48   | 70     | 55                             | 69      | 54                    | 73      |

| 1885 ..... | 46  | 44   | 66     |                                |         |                       |         |
| 1886 ..... | 44  | 43   | 63     |                                |         |                       |         |
| 1887 ..... | 45  | 43   | 63     |                                |         |                       |         |
| 1888 ..... | 43  | 42   | 62     |                                |         |                       |         |
| 1889 ..... | 42  | 41   | 60     |                                |         |                       |         |
| 1890 ..... |   | 41   | 59     |                                |         |                       |         |

#### NORMAL SCHOOLS.

The normal schools serve as preparatory schools for teachers of the elementary grades. The State provides the funds for the teaching force and for scientific apparatus. The remaining expenditures and those for the "Convitti" (establishments where pupils are boarded and lodged) are paid by the provinces and communes in which the normals are located.

There are still other schools of this character for the training of teachers which are maintained exclusively by provinces and communes, by corporations or individuals, while some receive State subsidies.

The normal schools are of higher and lower grades for men and for women. The lower-grade normal schools have only the power to confer teachers' diplomas for the three lower classes of the lower-grade elementary schools. The higher-grade normals, on the contrary, confer the diploma required to teach in the elementary schools of both higher and lower grade. In the normal schools for women a certificate or diploma is also conferred, which permits its holder to become a teacher in or directress of an infant school.

Instruction in the normal schools is gratuitous. The course is one of two years in the lower-grade normals, and is preceded by a preparatory course of three years.

An examination for admission is required of those who wish to enter the normal schools. Each normal has a practice school attached, in which the pupil can obtain practice in teaching. The normals for women have also an infant school attached, which is divided into three sections.

Persons desiring to obtain a teacher's position in the elementary schools are appointed by the communes (which pay them), after competing for such position in a competitive examination before the provincial school council. This council, after examining as to their qualifications,

presents the list of persons eligible to such positions, and the communal council has the duty to select and appoint the teachers. To determine the minimum legal salary for teachers, the elementary schools are divided into two categories, urban and rural, and each of these categories into three classes, in accordance with the wealth and population of the commune. The minimum legal stipendia, according to law of April 11, 1886, are as follows:

|                    | City schools. |        |        |        | Rural schools. |        |        |        |
|--------------------|---------------|--------|--------|--------|----------------|--------|--------|--------|
|                    | Higher.       |        | Lower. |        | Higher.        |        | Lower. |        |
|                    | Men.          | Women. | Men.   | Women. | Men.           | Women. | Men.   | Women. |
| First class .....  | \$254         | \$203  | \$193  | \$152  | \$173          | \$139  | \$152  | \$123  |
| Second class ..... | 213           | 170    | 183    | 146    | 164            | 131    | 144    | 115    |
| Third class .....  | 193           | 152    | 173    | 139    | 152            | 123    | 135    | 103    |

The stipends are augmented one-tenth for every six years of service in the same commune until the salary has been increased four times. The following table indicates the number of normal schools and pupils for certain years commencing with 1861-62:

*Normal schools. (a)*

| Year.         | Schools.            |                |        | Pupils enrolled.       |                   |        |
|---------------|---------------------|----------------|--------|------------------------|-------------------|--------|
|               | Government schools. | Other schools. | Total. | In Government schools. | In other schools. | Total. |
| 1861-62 ..... |                     |                | 86     |                        |                   | 3,742  |
| 1871-72 ..... |                     |                | 115    |                        |                   | 6,130  |
| 1875-76 ..... |                     |                | 101    |                        |                   | 6,775  |
| 1881-82 ..... |                     |                | 121    |                        |                   | 8,865  |
| 1885-86 ..... | 80                  | 53             | 133    | 7,243                  | 3,299             | 10,542 |
| 1886-87 ..... | 82                  | 52             | 134    | 7,808                  | 3,252             | 11,060 |
| 1887-88 ..... | 83                  | 54             | 137    |                        |                   | 11,694 |
| 1888-89 ..... | 95                  | 42             | 137    | 10,032                 | 2,804             | 12,856 |
| 1889-90 ..... | 98                  | 43             | 141    | 12,204                 | 2,980             | 15,184 |

*a* In 1892-93 there were 148 normal schools (100 Government), 1,534 teachers (1,034 in Government normal schools), 18,677 pupils (14,493 in Government schools). Of the pupils 1,703 were men, 16,974 women.

There are other institutes auxiliary or complementary to those for elementary instruction. Among the first-mentioned are two "convitti" (establishments where pupils are boarded and lodged and which have elementary schools attached) for the orphans of elementary teachers, and the institutions for the blind and deaf-mutes; among the second are comprised the "convitti," the educational institutions for girls and the two higher-grade normals for girls.

The expenditures for the elementary, evening, and holiday schools, for the normals, and for the other institutions noted above, infant schools excluded, however, are as follows: In 1888-89 the provinces expended \$153,892; the communes, \$10,866,756. In 1890-91 the State expended \$1,648,452.

## SECONDARY CLASSICAL AND TECHNICAL INSTRUCTION.

The aim of secondary classical instruction is to train young men in the studies requisite for acquiring the literary and philosophical knowledge which entitles them to enter upon special studies leading to the academic grades of a university. These branches of instruction are imparted in the "ginnasio" (lower grade classical school) in a five-years term, and in the "liceo" (higher grade classical school) in a three-years term. In order to be admitted to Class I of a "ginnasio" the student is required to pass an entrance examination in the branches of the higher elementary grade, and in order to be admitted to the first year of a "liceo" it is necessary to possess a gymnasial license (*licenza ginnasiale*), while the license of a "liceo" (*licenza liceale*) is required for admittance to a university course. The "ginnasi" are supposed to be supported by the communes, but in some provinces the State maintains them, in accordance with special laws.

The "licei" are supported by the State, as far as the expenditures for teachers and scientific material are concerned; the expenditures for the buildings and furniture are borne by the communes.

The State, either by law or by special agreement with the communes or other corporations, cooperates in maintaining the "ginnasi" and nongovernmental "licei." The communes, corporate bodies, and private individuals support similar institutions.

The State, moreover, maintains the "convitti" annexed to the governmental "ginnasi" and "licei," and, by law or special agreement, it also subsidizes other "convitti," whose maintenance would naturally belong to a province, commune, or to a corporate body or association. The aim of technical-professional instruction is to impart to young men who are ambitious to enter upon a specified career in the public service, i. e., in industrial, commercial, and skilled agricultural pursuits, such general and special knowledge as is required for these pursuits.

This knowledge is acquired and taught in technical schools, technical institutes, and in the institutes for the mercantile marine.

The course of instruction in the technical schools lasts three years, at the end of which a diploma is given to the successful candidates; this diploma is required for admission to a technical institute or to an institute for the mercantile-marine service. In the technical institute the instruction is divided, according to the profession to be pursued, into 5 sections, namely, physico-mathematics, land surveying, agriculture, commerce and trade, and industrial pursuits.

The courses last four years, and are divided into two biennial periods; one common to all sections, and one a special course for each section. In the institutes for the mercantile-marine service the instruction is divided into 6 sections, viz, as captains for the coast service, naval constructors of the second class, and machinists of the second class, a two-years course; captain for long-distance courses and naval con-

structors of the first class, a three-years course; and machinists of the first class a four-years course.

The diploma of the physico-mathematical section entitles, as does the "licenza liceale," to admission into the faculty for physical, mathematical, and natural sciences of a university.

The following table presents the number of institutes in which secondary classical and technical instruction is given, and the number of students enrolled:

*Institutes for secondary classical and technical instruction. (a)*

#### INSTITUTES.

| Year.        | Ginnasi. |                         | Licei. |                         | Technical schools. |                         | Technical institutes. |                     | Institutes of the merchant marine. |                     |

| 1889-90..... | 23,225          | 31,007              | 8,396         | 5,607               | 19,219                | 12,531              | 5,904                    | 1,123               | 1,008                                 | 26                  |

*a* In 1891-92 there were 735 "ginnasi" (178 State, 557 public or private) with 4,429 professors; students 57,525 (in State ginnasi 25,380; public or private 32,145). The "licei" numbered 321 (State 113, others 208); professors 1,853; students 15,713 (State 9,371, in other licei 6,342). The technical schools numbered 399 (State 184, others 215); professors 2,893; students 34,244 (State 21,411, others 12,833.) Technical institutes 74 (State 54); professors 1,315; students 8,647 (in State institutes 7,203). There were 21 naval institutes—"istituti nautici" training for the maritime service—(of these 19 Government) with 179 professors; students 1,320 (in Government 1,301).

*b* Until the close of 1879-80 there were no statistics published for nongovernment institutes.

The maintenance of the technical schools is imposed upon the communes where they are established. The State pays half of the teachers' expenses, however. In some cases, in accordance with special laws, technical schools are entirely in charge of the State.

The expenditures for the technical institutes and for those of the mercantile marine are borne in part by the State, which pays half of the

expenses for the teachers and other employees, and in part by the provinces and communes.

The expenditures for buildings and nonscientific material are furnished by the communes where the institutes are situated.

The expenditures for classical and technical schools and for the "convitti" for boys were accredited as follows—to the State, communes, and provinces—during the years 1888-89 and 1890-91:

|                           |             |
|---------------------------|-------------|
| Provinces (1888-89) ..... | \$447, 128  |
| Communes (1888-89) .....  | 1, 396, 698 |
| State (1890-91) .....     | 2, 389, 207 |

Still another class of instruction is imparted in institutes and special schools, such as practical schools of agriculture, agrarian schools, industrial schools, schools of art and trade, and professional schools. The expenditures are paid in part by the State, which, through subsidies given to the ministry of agriculture, industry, and commerce, in accordance with special laws to that effect, cooperates with the provinces, communes, and other corporate bodies. In order to secure admission to one of these schools it is necessary to have successfully finished the elementary courses or otherwise to have passed an examination for admission.

During the school years 1888-89 and 1890-91 the expenditures for this class of schools were distributed as follows:

|                           |            |
|---------------------------|------------|
| Provinces (1888-89) ..... | \$125, 677 |
| Communes (1888-89) .....  | 325, 498   |
| State (1890-91) .....     | 439, 655   |

#### SUPERIOR INSTRUCTION.

The highest grade of education is furnished in the universities, the superior institutes, and in superior special schools. The "Istituti Superiori" include the schools for engineers, the veterinary schools, the literary and scientific academy, the higher normal school for instruction in literature, and the superior institute for the perfecting of studies in Florence with its university faculties.

The universities comprise in general four faculties—law; philosophy and letters; physical, mathematical, and natural sciences; and medicine and surgery.

In some universities the schools of pharmacy and veterinary schools are annexed to the faculty of medicine and surgery. Not all universities have four faculties. The degree of doctor (Laurea) is conferred in each faculty at the close of the course. In the higher institutes there are faculties or sections of faculties where doctors' degrees and diplomas are conferred at the close of the course.

In the special schools diplomas are given for the different subjects taught there.

The special schools are the superior commercial schools, whose purpose it is to prepare young men for the management of banking and

commercial institutions, or for the career of consular agents in foreign countries, or for the position of instructors in the science of economics in technical institutes; the superior agricultural schools, which prepare teachers of agricultural sciences and to promote agricultural interests by means of experimental research; the superior naval school, for the training of naval and hydrographic engineers and naval constructors; the institute of forestry, for training persons as forest inspectors; and the industrial museum, for training as mechanical engineers (*ingegneri-industriale*), chemistry, and in special branches of mechanics and physics.

The expenditures for universities and superior institutes are in charge of the State and are included in the budget of the ministry of public instruction. The revenues and property of these institutions aid in their maintenance, and the fund is added to that administered by the State.

Some provinces cooperate, by means of special contracts with the State in the payment of expenditures for the increase of scientific apparatus, for the annexed schools, for the laboratories, and collections of the universities which are located in the respective provinces or communes. There are 17 Government universities. Four are called "free," because they are maintained by the provinces and communes where they are situated. The superior institutes are under Government control, and are 11 in number.

The superior special schools are also 11 in number, and are maintained by the State (the fund being included in the budget of the ministry of agriculture, industry, and commerce) in conjunction with the provinces and communes where they are situated.

The two superior institutes for the education of women are dependent on the ministry of public instruction, to the accounts of which the expenditures are charged. The following table gives a survey of the universities, the superior institutes, and the superior special schools, with a summary of the number of students enrolled in said institutes, commencing with the year 1866-67:

*Index of universities, superior institutes, and special superior schools.*

<sup>a</sup> In 1891-92 there were 17,347 students and hearers and 1,493 professors in State universities; in free (libera) universities, 445 students and 79 professors. In the superior institutes, 2,033 students and 233 professors; in superior special schools, 860 students and 158 professors.

The expenditures borne by the State for universities and other institutes and special schools amounted to \$2,077,959 for the school year 1890-91, which sum was included in the budget of the minister of public instruction, and \$112,905 in the budget of the ministry of agriculture, industry, and commerce.

The amounts contributed by the provinces and communes to the funds of universities, superior institutes, and superior special schools are added to the provincial and communal budgets. This fund is separate from the amounts furnished by the associations or corporate bodies for the general increase and progress of studies. To this latter amount the provinces furnished \$457,811 and the communes \$829,190 for the year 1888-89.

But the State revenues for this year indicate that the provinces and communes will only cooperate to the extent of \$152,536 in the maintenance of universities and other institutions administered by the State. The superior special schools, as has been mentioned before, are founded and maintained conjointly by the State, the provinces, and the communes, and are managed by local commissions, which include in their membership representatives from corporate bodies which aid in the maintenance of said institutions.

As appendix to this article, we add the latest statistics of universities, presented by Prof. Carlo F. Ferraris, and taken from the *Revue Internationale de l'Enseignement* for October, 1895.

*Enrollment in higher institutions in 1894-95 compared with 1893-94.*

### THE CATHOLIC SCHOOL SYSTEM OF ROME.

Through the courtesy of the editor of the North American Review (December, 1894, pp. 641-664), we have been permitted to make extracts from an article on the above subject, written by Archbishop Satolli (since created cardinal). This article clearly defines the work done by the papal authorities in Rome since 1870:

The education furnished in the Catholic schools of Rome is open to all classes, and, although their supreme aim is to educate the new generation in a Christian manner, they vary in method according to the grade, from the infant asylum up to the university courses, which are still exclusively reserved to the State by law. The number of Catholic schools is extraordinarily large, exceeding both that of the Government and municipal schools.

The supreme direction of all these schools is vested in the cardinal vicar, for the congregation of studies has only the surveillance of the higher courses of the clerical institutes. He is assisted in the direction of the elementary schools—

(1) By the pontifical commission, appointed by his holiness in accordance with the letter addressed to the cardinal vicar, dated June 26, 1878. Of this commission the monsignor vicegerent is the head.

(2) By special committee for the schools which are founded and maintained by the Society of Catholic Interests.

(3) By a special committee for the catechetical evening or night schools.

(4) By a special committee for the schools which are dependent on the apostolic almonry.

(5) By a special committee for the night and evening schools.

These committees, although each is independent of the other in its sphere of action, are all subject in general matters to the pontifical commission, in which each of them

is represented by one or more members. This tie, far from being an impediment to the development and progress of the various institutions, rather helps to keep them united by harmonizing their actions in such a way that their work does not conflict.

The pontifical commission, however, reserves the right to regulate questions of discipline, to compile the programmes, select the text-books, fix the days for examination, and other similar matters. It has also charge of the correspondence with the Holy See and the administration of the subsidies given by the Holy Father or by private bodies or individuals.

Two inspectors are assigned to the supervision of the schools which are under the immediate direction of the commission. The committees provide for the other schools. In addition to these inspectors, every member of the commission having the title of "patron" has the supervision of a certain number of schools. Two hundred and eleven different directors, divided up as follows, represent the commission and the committees at the various schools:

|  | Directors. |
|--|------------|
| Free schools for males.....              | 28         |
| Paying schools for males.....            | 14         |
| Evening schools for males.....           | 13         |
| Catechetical schools for males.....      | 8          |
| Industrial schools for males.....        | 4          |
| Asylums and boarding schools.....        | 5          |
| Free schools for females.....            | 50         |
| Paying schools for females.....          | 32         |
| Sunday schools for females.....          | 18         |
| Catechetical schools for females.....    | 7          |
| Evening schools for females.....         | 1          |
| Industrial and professional schools..... | 10         |
| Academies and orphan asylums.....        | 21         |
| Total.....                               | 211        |

As a rule, the directors are not obliged to teach. The selection and inspection of localities are intrusted to an architect, who is attached to the pontifical commission. In the direction of the higher and technical schools the cardinal vicar is assisted by a council of direction, which possesses the same powers as regards the high schools as the pontifical commission has over the primary schools. The members of both these bodies—clergy as well as laity—are noted for their nobility of birth, as well as for piety and learning. In addition to these, there are also high schools, which, although they follow the regulations of the others, may be called independent, inasmuch as they belong to the religious corporations. The number and classification of these schools will be found in Tables A and B:

TABLE A.—*Schools for boys.*

| Classification.                           | Number. | Pupils. |
|---|---------|---------|
| Free schools.....                         | 28      | 3,953   |
| Paying schools.....                       | 14      | 991     |
| Evening schools.....                      | 13      | 1,468   |
| Catechetical schools.....                 | 8       | 885     |
| Industrial schools.....                   | 5       | 501     |
| Free asylums.....                         | 14      | 1,727   |
| Paying asylums.....                       | 3       | 207     |
| Hospices and boarding schools.....        | 5       | 395     |
| Other elementary preparatory schools..... | 4       | 823     |
| Total.....                                | 94      | 10,950  |

TABLE B.—*Schools for girls.*

| Classification.                    | Number. | Pupils. |
|------------------------------------|---------|---------|
| Free schools .....                 | 50      | 5, 692  |
| Paying schools .....               | 32      | 2, 072  |
| Sunday schools .....               | 18      | 1, 274  |
| Evening schools .....              | 1       | 53      |
| Catechetical schools .....         | 7       | 560     |
| Industrial schools .....           | 10      | 448     |
| Free asylums .....                 | 18      | 2, 278  |
| Paying asylums .....               | 5       | 186     |
| Academies and orphan asylums ..... | 21      | 1, 072  |
| Total .....                        | 162     | 13, 635 |

## RECAPITULATION.

| Total .....     | 256     |
| Of the pupils:  |         |
| Boys .....      | 10, 950 |
| Girls .....     | 13, 635 |
| Total .....     | 24, 585 |

In speaking of the distribution of schools, Mgr. Satolli says:

It has been the wise and constant aim of the pontifical commission, aided by the religious corporations, to distribute the elementary schools as widely as possible and to conduct them in such a manner that, by their discipline, by the choice of teachers, by the excellence of their method of teaching and their educative course, they should merit the sympathy of the public and the confidence of the family. \* \* \*

The pontifical commission therefore did well in avoiding the plan of erecting large schools at a considerable distance apart and in deciding to establish a number of smaller schools, which, though more modest, would be convenient to all. As a result, there is not only not a parish, but there is hardly a street of any importance in Rome, that does not possess a Catholic school. It must not be inferred from this that the Catholics lack great scholastic edifices. On the contrary, in the past few years some beautiful buildings have been erected through the instrumentality of religious corporations.

Mgr. Satolli lays stress upon the fact that—

The first requisite of a good school is to have good teachers. \* \* \*

And at this point it is only proper to pay a tribute of praise to the religious corporations, which have stopped at no expense or sacrifice to provide the commission with a select body of teachers, both men and women, furnished with proper diplomas, and who, by their ability, zeal, and spotless character, have merited and enjoy to the full the confidence, not only of the commission, but of the public.

Teachers had also to be provided for such schools as were not dependent on religious corporations, of which there are a considerable number, and experience has shown it to be very difficult to obtain teachers who, in addition to their professional diplomas of residence, offer these secure guaranties of sound principles and morality which are indispensable for those who teach in Catholic schools. The pontifical commission therefore deemed it advisable to establish normal or teachers' schools designed to prepare their scholars for the career of teachers. The first of these to be

established was one for women, and is called St. Catherine's Institute. Another similar college for men was founded two years ago. St. Catherine's Institute, which has now been in existence fourteen years, has been productive of excellent results, inasmuch as it not only furnishes the best teachers for Catholic schools, but its graduates are even sought after by the municipality, which justly esteems them for their culture and conduct. The same gratifying results are confidently expected from the male college when its courses shall have been completed. \* \* \*

Speaking of the course of study, Mgr. Satolli says:

In the compilation of the programmes the commission endeavors to bring them as far as possible into harmony with those in use in the public schools, both as regards the division of classes and the courses of studies. In the schools for girls a finishing course of two years was added, so that the pupils, especially in the academies, might be able to acquire a superior education to that imparted at the elementary schools. \* \* \*

As regards the method of teaching, the commission strongly urged the teachers to adhere to the old system, which means that method by following which Dante, keenest of observers, noted the most relevant facts of life and of the physical world; by which Columbus discovered America and Galileo left, in the sphere of physical study, an immortal record. It is the method of observation which the modern Italian pedagogues very unpatriotically declare to have come from over the Alps, while, as a matter of fact, if it can be called the glory of any country, it is the glory of Italy.

The commission decreed that this method should be applied in an Italian spirit—that is, without northern vagueness and exaggeration, and not as a means of combating the supernatural, but of ascending toward it. It holds that the teaching of the school is intended for life, and for the whole life, for man does not live by bread alone. \* \* \*

While the pontifical commission was engaged in the direction of the elementary schools the directive council worked with equal zeal in the management of the high schools. Of the two the latter are the more important, because while the first provide for the education of the lower classes, the second initiate into the sciences and to an upright life that class which, fresh from the universities, is destined to form the cultured and influential section of society.

There are in Rome 18 high schools dependent on the Holy See, viz, 5 lyceums,<sup>1</sup> 5 gymnasiums, 5 technical schools, 2 normal schools, and 1 technical institute of higher grade. [See Table C.]

TABLE C.—*Statistical summary of the high schools for the year 1892-93.*<sup>(2)</sup>

| Institute Angelo Mai:         | Students. |
|-------------------------------|-----------|
| Lyceum .....                  | 70        |

| Elementary preparatory.....                                     | 823              |
| Total .....   | 3,132            |

The technical and normal schools, as well as the technical institutes, have all been founded since 1870—partly during the pontificate of Pius IX and partly during that of Leo XIII. Of the gymnasiums and lyceums 3 have been established since that date; the others were already in existence, but owing to the new laws it became necessary to reform them in many respects.

Of these 18 institutes 7 belong to religious corporations, the remainder being directly dependent on the directive council and pontifical commission. The Collegio Nazzareno, which is a most flourishing institution, is not included among this number, because, although founded and directed by the Fathers of the Pious Schools, it is under the jurisdiction of the local authorities.

As against these 18 Catholic institutions there are in Rome 19 State and 1 municipal high school—that is, 3 lyceums, 4 gymnasiums, 8 technical schools, 3 normal schools, and 1 higher technical institute. If we take into account the lyceum-gymnasium of the Collegio Nazzareno, the Catholic high schools equal in number those of the Government.

In speaking of the religious side of education, Mgr. Satolli says:

The commission has continually reminded the teachers that instruction is good only when it is united with an earnest moral and religious education. It therefore decreed that a fixed time should be set apart daily for catechism, so that the pupils from their earliest years should be familiarized with those pious practices which form the character of the true Christian. \* \* \*

The commission, moreover, being fully convinced that no branch of study, especially philosophy or history, can be correctly and completely taught without the aid of religion, which like a luminous beacon guides the understanding, directed that

<sup>1</sup>Special classes.

<sup>2</sup>The oratory is attended by 700 pupils.

religious instruction should be given at least once a week in all the schools and classes, with a view not only to improve the minds of the pupils, but as the most effectual means of imparting that complete religious and moral education which is the supreme aim of Catholic schools.

In order that the pupils may from their earliest years become familiar with the practices of Christian piety, sodalities have been formed, each of which has a spiritual director, whose duty it is to see that the members comply with the rules and fulfill all their religious duties. Special spiritual exercises are held by these sodalities at Easter, when children whose parents desire it are prepared for their first communion.

The work of the pontifical commission and directive council does not end with the direction of the elementary and high schools, for there is no class of citizens for which these bodies, aided by the religious corporations, have not provided the means of obtaining a Christian education and the highest grade of culture in the easiest manner.

Acting on the advice of the directive council, the holy father founded in Rome 2 institutes of superior courses or finishing courses, namely, the Academy of Historic Jurisprudence and the School of Higher Literature, and selected as their professors men noted for their scientific and literary attainments. The first of these institutions is devoted to jurisprudence, history, and archaeology; the second to ancient and modern literature.

*Boarding houses.*—Two boarding houses have been provided for the scholars who come to Rome from the provinces. One of these has been in existence for many years and is set apart for those who attend the university courses; the other, which is for the girls who attend the teachers' institute, was erected by a committee of ladies as a memorial of the episcopal jubilee of the holy father, and by them turned over to the deserving Salesian Missionary Sisters. It is not only required that those who are admitted to these houses fulfill their duties as good Christians, but, in addition, religious, scientific, and literary conferences are frequently held, with a view to confirming the scholars in good principles.

*Boarding schools.*—There are in Rome 26 boarding schools, of which number 5 are for boys and 21 for girls. They are attended by 395 boys and 1,072 girls. All these schools belong to religious corporations. It is needless to add that the seminaries for the clergy, of which there is a very large number, are not included under this head. The rate charged at these boarding schools ranges from 30 to 80 lire monthly (\$5.79 to \$15.44), so that they are accessible to families of moderate means as well as to those of affluence. In some of these schools free scholarships have been established. \* \* \*

In describing the boarding schools for girls Mgr. Satolli says:

The instruction given to the girls in these boarding schools is divided into two grades—elementary and superior. In some of them the entire normal course is given, thus enabling such pupils as desire it to obtain diplomas. The sisters who conduct these courses are furnished with diplomas of professorship, obtained after examination at the State universities. In the examination which took place for this purpose four years ago by concessions of the minister, the Sisters of St. Ann of Providence, the Oblates of the Infant Jesus, the Ladies of the Sacred Heart, the Marcelline Sisters, and the Sisters of St. Joseph especially distinguished themselves.

The Government maintains in Rome two colleges, viz, a boarding school for girls, which is attached to the normal school, and the provincial school for boys.

*Semiboarding schools.*—To a number of these boarding schools are attached what are known as "mezza pensione;" that is, schools attended by day scholars who take their midday meal there. They are a comparatively new institution, and have met with much favor among the families who have taken advantage of them.

*Orphan and other asylums.*—No city of Italy, or, indeed, in the world, possesses in comparison so many charitable institutions for every class of poor and suffering persons as Rome. \* \* \*

Not to mention those institutions which do not come within the scope of this article or those which existed prior to 1870, I shall only allude briefly to the ones established since that date. Preeminent among these is the Hospice of the Sacred Heart, conducted by the Salesians, which was opened last year by the cardinal vicar as a memorial of the episcopal jubilee of the holy father. It is an immense building of beautiful design, and includes not only elementary schools but also art and industrial schools, a gymnasium, and library. The scholars who attend the day or night schools here are educated gratuitously, and only a very small fee is charged for the boarders. This institution contains in all about 300 pupils. \* \* \*

Another institution which is maintained by voluntary contributions is the Pious Institute of the Immaculate Conception, which was founded by the Brothers of Charity, familiarly known as the Grey Brothers. It receives orphans gratuitously, and also maintains day and boarding schools containing about 400 pupils.

The orphan asylum of the Sisters of Cluny, of St. Jerome Emiliani, the Protectory of St. Joseph, the Asylum of the Sisters of Nancy for Idiot Children, and the Institute for Abandoned Orphans, conducted by the Daughters of the Passion of Calvary, should also be included under this head.

In each of these charitable institutions the inmates, in addition to receiving an elementary education, are specially instructed in some art or trade, thus enabling them to earn an honest livelihood in after life.

*Infant asylums.*—The pontifical commission has under its jurisdiction 40 infant asylums, of which 32 are free. As against these the municipality has only 12. In these asylums, as in every other Catholic institution, every part of the modern method which is good and useful has been adopted. \* \* \*

*Art and trade schools.*—Among the art and trade schools in Rome are the Institute of Pius IX and the Hospice Bonanni, for young artisans; the Institute of Vigna Pia, for instructing poor boys in agriculture, and that of Tata Giovanni, where the poor are instructed in various arts and trades.

In all the above, in addition to reading and writing, special care is given to the study of design, which is accounted a great aid in learning the arts and trades. The evening schools, founded by the Artisan and Working Society, hold examinations yearly of the work of the pupils, which is executed accurately and artistically. \* \* \*

*Industrial schools.*—In addition to the higher courses and finishing courses adapted to the daughters of wealthy parents, industrial schools were opened for girls belonging to the poorer classes. Only those girls are admitted to these schools who have completed the higher courses in the elementary schools, although pupils who have only passed the third class are sometimes admitted. Embroidery of various kinds, sewing, cutting garments, ironing, repairing, and every other branch of housework necessary to qualify the pupils to earn their livelihood are taught here. The most skillful pupils are rewarded by a small daily honorarium. Some of these pupils have earned such a reputation for good work among the people that they receive more work than they can execute.

The professional schools under the direction of the Sisters of Charity of St. Vincent de Paul and of the Sisters of Divine Providence in the Piazza Fiammetta are specially noted for the excellent quality of their work as well as for the number of their pupils.

*Catechetical schools.*—These schools were especially established for the boys and girls who attend the State or municipal schools where no religious instruction is given. There are 15 of these schools, 8 for boys and 7 for girls, the average yearly attendance being 1,445. These schools are a most efficacious help to the clergy, for, like the other Catholic schools, they help to prepare the boys and girls for their first communion and to instruct them in the duties of a good Christian.

*Sunday schools,* which have the same object as the catechetical schools, are 18 in number, and contain 1,274 pupils.

Owing to lack of space, it is impossible to describe all the other Catholic institu-

tions in Rome which have for their aim the education of youth. No mention can therefore be made of the Catholic clubs, the literary and scientific academies, reading and debating circles, etc. \* \* \*

Mgr. Satolli, referring to matters of discipline, states that—

The schools are regarded by many parents simply as places where their children are taken care of for a few hours daily; others look upon them as workshops where the children learn to read, write, cipher, and nothing else. Indeed, there are only a few who appreciate the exalted and delicate function of the schools. It has been wisely ordained that every Catholic school, especially the higher ones, should have a special prefect of discipline. This prefect watches the coming and going of the pupils from their classes, keeps a record of the absent and late ones, corresponds with the parents of the children, and sees that all the regulations are rigidly enforced. The existence of this office helps not only to maintain discipline but is also an important factor in the proper progress of the studies, for the president and directors, being relieved of all care in matters of discipline, are freer to superintend the teaching and teachers.

In order to excite in the pupils the spirit of emulation, prizes are offered at the beginning of each scholastic year. In the higher and paying schools silver medals and diplomas are awarded, while in the free schools gifts of clothing are bestowed.

The punishments inflicted in the Catholic schools are similar to those in use in the State schools, but, happily, it is only very rarely that the severest one, expulsion, has to be resorted to.

In speaking of the expenditures, Mgr. Satolli says:

It is difficult to form an accurate estimate of the amount expended on so many and such varied scholastic institutions as have been mentioned. The paying schools directed by the religious corporations, which provide for current expenses out of their own funds, in common with those which derive an annual allowance from the pontifical commission, depend upon public munificence and upon other sources for the balance necessary for their support. Nearly all the primary schools, and also the secondary institutes, which are directed by lay folk, are entirely dependent upon the pontifical commission and upon the school fund set apart by the holy father.

Taking into account simply the amount furnished by the Pontifical commission and by the administration of the estates of the Holy See for the high schools, the annual expenditure exceeds 1,000,000 lire (\$193,000).

The average yearly income of the pontifical commission is about 400,000 lire (\$77,200), and the outlay nearly equals that amount.

This income is derived—

- (1) From direct donations of the holy father.
- (2) From the administration of the estates of the Holy See.
- (3) From the donations of certain corporations of the chapters of the patriarchal churches, and from the contributions of sacred congregations, and of some private individuals.
- (4) From the fees of the pupils of St. Catherine's Institute and of the Gregorian College.

With the amount thus obtained the pontifical commission provides—

- (1) For the ordinary and extraordinary allowances of the personnel.
- (2) For the furnishing, etc., of the schools.
- (3) For the distribution of books, etc., among the poor pupils.
- (4) For the rental of the schools and asylums.
- (5) For the erection and repairs of buildings. \* \* \*

All the members of the pontifical commission, including the president, who has the general direction of the schools as well as of the administrative office, give their services gratuitously.

There are several schools, orphanages, and asylums, which do not derive their support from the pontifical commission, but which are maintained exclusively by the Roman aristocracy or by Catholic societies or committees.

If the amount which is spent by the religious corporations and that which is saved by their giving their services gratuitously, as well as the sum which is derived annually from public and private benefactors, were added to the amount spent yearly by the pontifical commission, the expenses for primary Catholic education in Rome would reach a total of at least 1,500,000 lire yearly (\$289,500).

Among the schools wholly maintained by the administration of the estates of the Holy See are the Historical-Juridical Academy, the School of Higher Literature, also called the Leonine Institute, the Lyceum-Gymnasium, the Technical School Angelo Mai, and the Technical Institute De Merode.

With the exception of the Leonine Institute, the administration of all these institutions is vested in the directive council.

In summing up the work done in these various institutions, Mgr. Satolli states that—

The supreme end of these institutions, which is religious and moral education, has not been neglected in the regulations, programmes, books, or methods of teaching; and it has been their special aim to deviate as little as possible from the national traditions, which so harmoniously combine faith and science, and to furnish the boys and girls of the new generation with that grade of culture which is best adapted to their social position.

That the Roman people appreciate the beneficent efforts of the holy father and the work of all those who, with sentiments of profound admiration and reverence, assist him, is demonstrated by the ever-increasing number of pupils who flock to the Catholic schools.

#### THE SCHOOLS OF LEGHORN IN 1893.

An interesting presentation of the schools of Leghorn is made by the United States consul, Radcliffe H. Ford. It is here appended.

Mr. Ford says:

The schools of Leghorn compare favorably with those of the United States, considering the time they have been established, as, until the unification of all the provinces of Italy in 1870, there was no general school system. Leghorn has six schools devoted to the teaching of the higher branches and special courses, which are supported by the Government, aided by municipal contributions, ranging from \$1,780 to \$3,500 annually. There are 42 public schools supported entirely by the city, with an annual attendance of about 3,600 pupils, the annual cost of which is about \$55,000. The establishing of these schools throughout Italy marks the first step of real progress for the common people, and can not help being manifest in the coming generations. Among the schools supported by the Government, with municipal aid, are those known as mechanical and industrial schools.

The schools in this district of an industrial nature, where trades or mechanical professions are taught, are situated in Leghorn, Volterra, and Carrara. The school at Leghorn is known as "Scuola di Arti o Mestieri" (School of Arts and Trades), and was established by the municipality under a royal decree in the year 1886, but only went into successful operation in 1888. It is a free school, supported by moneys derived from the following sources annually:

|  |         |
|--|---------|
| City of Leghorn .....                                | \$1,942 |
| Province of Leghorn.....                             | 579     |
| Chamber of commerce, Leghorn .....                   | 232     |
| Ministry of agriculture, industry, and commerce..... | 780     |
| National treasury for schools of machinists.....     | 386     |
| Total .....  | 3,919   |

The age for admission is from 12 to 16 years, and the most of the pupils enter at the earlier limit. For entrance it is necessary that the applicant have a certificate of promotion from the third to the fourth class of the regular public schools or pass an examination showing such proficiency in reading, writing, arithmetic, grammar, and geography as would be necessary for such promotion.

The school will accommodate 170 pupils, and the limit is full.

There are four sections or divisions in the school, and the branches taught and length of course vary in different sections. The sections of the school are as follows:

(1) Industrial and metallurgical, course three years, comprising arithmetic, geometrical drawing, decorative drawing, mechanical design of machinery, with practical work in machine shop, and in the last year technical electricity by oral lessons, with practical work in the manufacture of electricity by an electric-light plant.

(2) Decorative arts, course three years, comprising arithmetic, geometry, decorative drawing, with practical work on room walls with oil colors, lithography, figurative drawing, also carving and modeling in wood, marble, plaster, and pottery.

(3) Machinists and engineers, course two years, Italian language, arithmetic, geometry, algebra, drawing, with practical work in machine shop and on stationary steam engines.

(4) Firemen, course one year, teaching by oral lessons of the construction and work of steam-engine boiler, with practical work on same.

The first and second sections are day sessions, the third and fourth are evening sessions. At the Government exhibition of last summer, at Palermo, for work by schools of this class, several of the pupils received medals and prizes for their proficiency. The school has a room for machine work fitted with lathes and other machinery, the power for which is furnished by their own engine, and it also furnishes the power for an electric plant for lighting the building.

At Volterra is a school known as the Industrial School of Volterra, but it is more properly a school of arts. The instructors teach geometrical, architectural, and figurative drawing, modeling in plaster, and decorative painting. The age of admission is 12, and the same requirements for admission are necessary as at Leghorn; length of course, four years. It has been in existence since the early part of this century, and is now supported as a free school by the State and municipality.

Regarding the schools of this class at Carrara, I quote Mr. Ulisse Boccacci, the consular agent, as follows:

"The only educational school where an industrial and mechanical training is also given is the Scuola Industriale di Carrara, established in this city. It is one of the four similar schools of Italy. The other three are found at Agordo, Iglesias, and Caltanissetta.

"The following are the studies taught at that school: Italian language, history, and geography; English language, industrial design, mathematics, physics, and chemistry; topography and its applications, topographic design; mechanics, general and special; engineering design, mineralogy and geology, and quarry working.

"The applicants can obtain admission by exhibiting a license of a Government technical school or an equal school (*pareggiata*).

"The length of the course of training is two years, and, after having passed examination, pupils may get a diploma of experts in mineralogy.

"The school is public and without charge, and it is supported in equal proportion by the Government, the province, the municipality, and the Chamber of Commerce of Carrara.

"It was founded in the year 1872, with the title of Industrial School. In 1885 it was remodeled, adding to the teaching mineralogy.

"Carrara has, besides, an academy of fine arts, where sculpture, architecture, and carving are taught. It was founded in the year 1769 by the Duchess of Este, reigning at that time in this district.

"The pupils are admitted at the age of 14 years by application made in writing by their fathers or governors, accompanied by necessary documents.

"The length of the courses of training is from seven to ten years for sculpture and five years for architecture and ornaments.

"The average number of pupils frequenting this school is about 250.

"This school is likewise public and without charge, and it is entirely supported by the Government."

The law regarding apprenticeship is very similar to that of the New England States. A minor, with the consent of his father or guardian, may in writing indenture himself with a party for a term of years to be taught a trade. This, however, is but seldom done now in this consular district. The agreements are usually oral when it is contemplated that the whole trade shall be learned from the same party, and stipulate that for the first two years the apprentice receives no wages; for the third year he receives, perhaps, one-half franc (about 10 cents) a day, increased from year to year until at the end of seven years he will receive from 2 to 2½ francs a day. The apprentice under this agreement bears his own expenses. The most of the trades in reality are learned by the minor from the beginning as an assistant or general helper with some party, under whom he gradually acquires a knowledge of the trade, without any agreement between the parties for any special length of time. The learner may be employed by several persons before he masters the trade.

#### CURRENT EDUCATIONAL MOVEMENTS.<sup>1</sup>

These movements include the appointment of commissions to investigate the subject of school programmes and text-books and of physical culture. Then there have been discussions appertaining to manual training, to the prompt payment of teachers' salaries, to increase of pensions for teachers, university reform movements, the more thorough education of women, the establishing of schools complementary to the elementary grades, the extension of obligatory school attendance to 12 years of age, and the need of a more practical education for life's duties. The subject of examinations for entrance to secondary schools has also been discussed, and the holding of the "licenza elementare" admits from State and private schools to secondary schools without other examinations. Students of gymnasia and lyceums receive the "licenza liceale" from 1894 on, if they have earned it by completion of three or five years of study, with the cum laude additional to the passing of the examinations. With the "licenza liceale" scholarships are granted for further study in Rome or other prominent university centers. The changes in the ministries<sup>2</sup> may have modified the carrying

<sup>2</sup>Ministers since 1847: Cesare Alfieri di Sostegno, November 30, 1847, to March 16, 1848; Carlo Bon-Compagni di Mombello, March 16-July 29, 1848; Urbano Rattazi, July 29-August 4, 1848; Vincenzo Gioberti, August 4-16, 1848; Felice Merlo, August 16-27, 1848; Carlo Bon-Compagni di Mombello, August 29-December, 1848; Carlo

out of these various plans, but enough has been done to indicate the efforts toward educational progress made by Italian statesmen. As far as can be ascertained, the educational movements which tend to become permanent bases of school operations are here noted.

The heavy burden entailed upon the Italian Government by the effort to keep the army on a war footing seemed to necessitate cutting down the budget in other directions; hence an effort was made to close several of the universities<sup>1</sup> where there were but few students, and to bring those students to the large university centers, such as Naples, Turin, or Rome. In 1892-93 the Government eliminated from the budget the subsidies accorded to the free universities of Camerino, Ferrara, Urbino, and Perugia. The students at once revolted; local pride and tradition were touched; great opposition was developed, and every effort that has been made so far to change existing conditions in the universities has met with similar opposition. There were so few students at Macerata (264), Cagliari (201), Modena (384), Parma (385), Sassari (157), and Siena (229) that the Government's desire to suppress them seems but natural, if it is considered that the intellectual and financial benefits accruing to the public are not sufficient to warrant their continuance. However, the strong objections raised in those university centers led to a lowering of the subsidies for all universities that year (1892-93).

Cadorna, December 16, 1848, to March 27, 1849; Christoforo Mameli, March 27, 1849, to November 10, 1850; Pietro Gioia, November 10, 1850, to October 20, 1851; Luigi Carlo Farini, October 21, 1851, to May 21, 1852; Carlo Bon-Compagni di Mombello, May 21-November 4, 1852; Luigi Cibrario, November 4, 1852, to May 31, 1855; Giovanni Lanza, May 31, 1855, to October 18, 1858; Carlo Cadorna, October 18, 1858, to July 19, 1859; Gabrio Casati, July 24, 1859, to January 15, 1860; Terenzio Maniani della Rovere, January 20, 1860, to March 22, 1861; Francesco De Sanctis, March 22, 1861, to March 3, 1862; Pasquale Stanislao Mancini, March 3-31, 1862; Carlo Mattenci, March 31-December 7, 1862; Michele Amari, December 7, 1862, to September 23, 1864; Giuseppe Natoli, September 23, 1864, to December 31, 1865; Domenico Berti, December 31, 1865, to February 17, 1867; Cesare Correnti, February 17-April 10, 1867; Michele Coppino, April 10-October 27, 1867; Emilio Broglio, October 27, 1867, to May 13, 1869; Angelo Bargoni, May 13-December, 1869; Cesare Correnti, December 14, 1869, to May 18, 1872; Quintino Sella, May 18-August 5, 1872; Antonio Scioloja, August 5, 1872, to July 10, 1873; Antonio Scioloja, July 10, 1873, to February 6, 1873; Girolamo Cantelli, February 7-September 6, 1874; Ruggiero Bonghi, September 27, 1874, to March 24, 1876; Michele Coppino, March 25, 1876, to March 24, 1878; Francesco De Sanctis, March 24-December 19, 1878; Michele Coppino, December 19, 1878, to July 13, 1879; Francesco Paolo Perez, July 14-November 24, 1879; Francesco De Sanctis, November 25, 1879, to January 1, 1881; Guido Baccelli, January 2, 1881, to March 29, 1884; Michele Coppino, March 30, 1884, to February 16, 1888; Paolo Boselli, February 17, 1888, to February 8, 1891; Pasquale Villari, appointed February 9, 1891; Signor Martini, appointed May 15, 1892; Signor Gallo, appointed December 3, 1893; Guido Baccelli, appointed December 13, 1893.

<sup>1</sup>According to Signor Martini, the universities are too numerous; there is deficiency in scientific appliances, and too great poverty of endowment. The possible remedies include restrictions in right of conferring degrees, greater autonomy in the management of each university, and the suppression of a certain number. (*Nuova Antologia*, March 15, 1894.)

*a* Or, in dollars, \$281,010; \$266,706; \$14,364 decrease.

There are doubtless other economies in the budget outside of those for universities. The programme of studies in the Italian universities ranks with that of prominent universities of Europe and, as is stated by Professor Oldrini, "in several branches, such as legal jurisprudence and moral and economic social sciences, Italy holds a prominent place among them." The programmes of the universities and those of the special and superior institutes newly created within the last twenty years have been thoroughly modified according to the requirements of modern ideas and the advancement of sciences, literature, and arts. Among other things "sociology is taught in 10 universities and in several autonomous academies, and scientific pathological sociology forms a basis of treatment for the criminal."

In 1891-92 the minister of public instruction, Signor Pasquale Villari, introduced a bill in the Chamber of Deputies modifying the organization of provincial school administration and another bill reorganizing the higher council of education. According to these bills, the "provveditore" and the school council of each province are to have only the elementary schools under their charge, while a new officer, "provveditore dell'istruzione secondaria," is to have charge of secondary education in the province. These officials are to reside in the cities of Turin, Milan, Padua, Bologna, Florence, Rome, Naples, Bari, Palermo, and Cagliari. Each of these provveditore is to be assisted by a council for secondary education. The bill relative to the higher council of education reduces the number of its members from 36 to 24, who are to be appointed for six years, 4 of them going out each year, and they will only be eligible for reelection after a year's interval. Of the 4 members to be appointed each year, 2 are to be chosen by the minister and 2 others in turn designated (to the ministers) by the faculties of higher studies. It is somewhat doubtful whether these bills became laws, as Minister Villari was succeeded by Minister Martini in 1892 (May 15).

Signor Villari's successor submitted an elaborate and interesting programme of reforms in the educational organization of the Kingdom. He first proposed to establish a "scuola unica di cultura generale," to follow after an elementary school course of five years' duration. This institution is to combine some characteristics of the lower classes in the present "ginnasio" with studies in similar classes of technical schools.

A three-years course is to serve as a preparatory course for practical life and for higher schools. The communes were expected to establish and in part maintain this "scuola unica," but, as with other schools, a State subsidy is desired. The course is to be somewhat elective, so that students may pursue the studies most suited to their needs.

The statement has been made that in the reorganization of public school education the elementary has been sacrificed to that of secondary instruction. One of the Italian deputies, Signor Gallo, considered that individuals are mistaken who yield to secondary education the same efficacy as a means of educating the people as to elementary education. He also advocates a "school complementary to the elementary," where the pupils may be prepared for life's duties and for the defense of the country. The reform movements tend, as different authorities indicate, to modify the traditional rigidity of Italian secondary education and to introduce a more elastic and modern régime rather than to overturn the whole edifice. The figures indicate that the number of pupils in secondary schools has more than doubled within the last twenty years, and more progress is perceptible in these than in the elementary grades. Hence the greater effort to bring about reform movements in the elementary grades by the appointment of commissions to investigate their needs, for it is stated that the methods now employed in elementary grades tend toward "the arid process of mental exercises to the detriment of the development of the reasoning power and of the moral aims of education." In secondary school matters the discussions are, as in other countries, whether classical or a more practical education is necessary. The former acts as a disciplinary power, giving more intellectual force; the latter gives greater mastery over the material world and forms a stronger backbone to the nation.

Signor Cavallotti, deputy, urges the doing away with the present cumbersome school organization, the numerous officials, the surplus universities, and that in place of so many "half-starved savants encumbering the social plane" there be established "practical training schools for citizens who will be of value to the nation."

The commission appointed to revise the programmes of elementary studies presented the result of their labors to the minister of public instruction on November 22, 1894. The general regulations of the year 1888 were adhered to, but there were special recommendations concerning education and discipline in general. Complaint was made all over Italy of too many studies, and of those unsuited to the age of the child, and of too many daily exercises. The effort of the commission was to bring the studies, which are to be fewer in number, within the scope of the child's mind, and to reduce the number of hours a day in the classes. The subjects of study required for examination are Italian (in which the child must give clear expression to his thoughts), penmanship, geography, arithmetic (the common rules), and

history (local and general of Italy of past and present periods), and the duties of citizenship. There are exercises in gymnastics, singing, and needlework, but discretionary powers are given to the teachers. Morals are taught by example rather than by any set lessons to the pupils. The higher problems of arithmetic are relegated to the secondary schools. The programme covers the years 6 to 10, and if still further elementary instruction is needed there are the Sunday and holiday schools.

As an indication of the methods of study and recitations required in the elementary grades, the code of education is cited in part. Reforms now tend toward more simple methods:

*Preliminary instruction.*—In the elementary schools arithmetic must be taught in a manner altogether practical. Let the master abstain from giving demonstrations which would not be understood at that tender age. Let him limit himself to impressing well on the minds of the pupils the definitions and the working of the "four rules," and to see that they are worked expeditiously and without hesitation.

When the teacher proposes concrete problems the questions proposed must be most simple, so that the pupils may readily perceive the connection between the requirements of the problem and the particular operations required for its solution.

To teach what little is requisite of the notation of vulgar fractions let the teacher begin by explaining with precision the meaning of the fractions  $\frac{1}{2}$ ,  $\frac{2}{3}$ ,  $\frac{1}{4}$ ,  $\frac{1}{5}$ , etc., and let him subsequently cause the pupils to construct tables of the multiples of these fractions.

From such tables will naturally follow the notions of proper and improper fractions, and of mixed numbers, the idea of composite numbers, and the rule for converting an improper fraction into a mixed number, and vice versa.

In teaching the rule of three let the teacher's principal aim be to communicate to his pupils a sure criterion for distinguishing the cases to which this rule applies.

*First year.*—Mental exercise in addition and subtraction. Reading and writing of Arabic figures.

*Second year.*—Numeration and notation of numbers with several digits. Addition and subtraction of integers. Multiplication by integers.

*Third year.*—Division of integers. The four rules with decimals. Definition and free-hand drawing of the most important geometrical figures. The metric system. Solution of simple problems with concrete numbers.

*Fourth year.*—Meaning of a fraction. Proper and improper fractions and mixed numbers. Interconversion of fractions. Reduction of an improper fraction to a mixed number, and vice versa. Conversion of a vulgar fraction to a decimal. Rule of three by unitary method. Applications.

#### A.—FIRST CLASS (LOWER SECTION).

*Italian language.*—Graduated exercises in formation of syllables, analyzing words selected for that purpose and explained. Formation of letters, syllables, and words by imitation. Writing from dictation words of simple syllables. Graduated lessons in reading and in correct pronunciation. Explanation of words and sentences read. Writing from copy or dictation.

*Orthography.*—Memory exercises.

#### B.—SECOND CLASS.

*Italian language.*—Reading with ease and intelligence, with explanation of the matter read. Dictation and orthography. Graduated exercises in calligraphy.

*Parts of speech.*—Conjugation of auxiliary verbs and of regular verbs by means of

sentences carefully selected to inculcate moral truths and to illustrate rules of grammar. Elementary knowledge of analysis. Short and easy composition by imitation exercises on the nomenclature of objects in daily use.

#### C.—THIRD CLASS.

*Italian language.*—Reading, with explanation of the matter read. Declension of nouns and adjectives. Conjugation of irregular and defective verbs. Use of the parts of speech and oral exercises in grammatical analysis. Periods and punctuation. Graduated exercises of composition. Short tales, easy descriptions, letters. Exercises in nomenclature of objects in domestic use, of trades and arts.

*Progressive exercises in calligraphy.*—Memory exercises.

#### D.—FOURTH CLASS.

*Italian language.*—Reading, with explanation of the matter read. Usual grammar and exercises. Composition. Tales from the history of Italy, fables, descriptions, letters on various subjects. Nomenclature of objects in domestic use, of trades and arts.

*Progressive exercises in calligraphy.*—Memory exercises.

In the teaching of geography attention is called to geography of the first three classes in the gymnasium. This study must be directed to a double purpose: First, to give to the students (and especially those who will not attend the higher classes) an elementary but complete knowledge of the earth, and particularly of Italy; and, secondly, to be auxiliary to the study of history.

That the knowledge of the earth may be, albeit elementary, yet complete, it must comprise mathematical, astronomical, physical, and political geography. But in all this, having regard to the nature of the science and to the tender age of the pupils, it is necessary that the professor should proceed with foresight in the selection of the matter to be taught, dwelling on principles, and illustrating them in such a manner as to render them clear to the intelligence of the students, taking care, however, that the popular explanations and illustrations which he makes use of do not militate against scientific explanations; and further, that he should not substitute some mere practical process for one thoroughly scientific, since frequently it is the case that, to understand or remember a fact better, it seems advantageous to communicate extrinsic facts, rather than to thoroughly investigate their intrinsic nature and their correlation to each other.

This premised, the study of geography is divided as follows:

*First class.*—General notions of astronomical, topographical, physical, and political geography. Detailed geography of Italy.

*Second class.*—Geography of the Old World.

*Third class.*—Geography of America and Australia. Systematic recapitulation.

That the teaching may be easy, efficacious, and most fruitful it must be given *viva voce*, with no other help but the artificial globe and maps.

The student should imprint on his mind the form of the earth, her parts, and principal subdivisions and phenomena (*accidenti*), and the political arrangement in outline.

The reading of the programmes for the higher schools of the Kingdom suggest, among other things, the advantage which teachers in Italian schools enjoy with regard to the teaching of history. In no other country<sup>1</sup> can the course of universal history be so easily and naturally combined with the history of the nation, while the distinction

<sup>1</sup> We quote from a writer in the *London Journal of Education*, April 1, 1891.

between ancient and modern is to a great extent obliterated by the continuity of Rome. The history programme for the higher schools marks off five periods: (1) Greek history; (2) Roman history, from the origin of Rome to the fall of the Western Empire; (3) history of Europe, with special reference to Italy, from the fall of the Western Empire to the discovery of America; (4) from the discovery of America to the treaty of Aix-la-Chapelle; (5) from the treaty of Aix-la-Chapelle to the death of Victor Emmanuel.

In Italy also the question of gymnastics has attracted much attention, and a commission has lately presented its report on the principles to be followed in teaching them, or, rather, in training masters and mistresses to teach them, in the normal schools of gymnastics which are already established at Rome, Naples, and Turin. The report pronounces for a combination of gymnastics with apparatus, and natural gymnastics, i. e., athletics and games. The programme for the training of teachers includes such instruction in anatomy and physiology as is necessary for mastering the theory of the subject. Practical gymnastics are to include various athletic exercises and games, swimming (for both sexes), and single-stick and some sword exercises (for boys).

According to the report in regard to "*Educazione fisica nelle scuole*," published in the *Bollettino Ufficiale dell'Istruzione pubblica*, November 30, 1893, the commission for the study of physical training desires to formulate regulations which will tend to form healthy and robust men as useful citizens and prepared to defend the country in moments of peril. Stress is laid upon the care that teachers should have in regard to the use of apparatus unsuited to youths under 14 years of age, and special care must be taken in these exercises as to the overuse of gymnastics by girls of any age. Teachers are to be thoroughly trained in the use and abuse of gymnastics, or there can never be a rational application of such exercises. Buildings or rooms should be large and well ventilated, to be useful for purposes of physical training. The president of the commission, Signor F. Todaro, suggests that a permanent commission be appointed for the study and supervision of physical training, and that the numerous Italian gymnastic societies (more than 100) be encouraged to form a sort of federation, to place their courses before the minister of public instruction, to join with the commission in developing the best methods for physical culture, and that subsidies be granted to promote the extension of physical training. He hopes that playgrounds may be established, athletic games encouraged, rowing, climbing mountains, riding, and in fact that everything pertaining to the development of the body may be encouraged by the authorities. The commission does not suggest the introduction of military training into the schools, but limits itself to such training as would naturally come under the heading of gymnastics or physical training, so as to strengthen the body, accustom the youth to endure fatigue, expand the chest, make the body obedient to his will; all this will act as a disci-

plinary force and aid in making good soldiers when the time comes for entering the army.

The first national congress for the study of the subject of manual training was held in Ripatransone in September, 1889, and that city (in the Picine territory, 30 or 40 miles south of Ancona) is now recognized as the center for the diffusion of manual training throughout Italy, as the school established there is a summer normal school for manual training. The gradual ingrafting of this phase of education upon the school system of Italy may be best understood by extracts from a letter of Professor Paroli to the teachers of Italy, which appeared as the preface to "*Principi Fondamentali del Lavoro Manuale Educativo*" (the Italian edition of Otto Salomon's lectures on manual training). First it may be stated that in 1887 the Italian Government sent 16 male teachers to Nääs, in Sweden, to study in the summer manual training course there, and the result of their study was to interest prominent men of Italy in the subject of sloyd.

Professor Paroli says:

In our own country the work of Herr Salomon has found many imitators, who have been more courageous and intelligent than fortunate. Professor Tegon at Rome, the coadjutor of Pastorello, Borgna at Turin, Frascara at Genoa, Professor Pasquali at Brescia and Assizi, Professor Consorti, at first with Sutto and Pastorello, afterwards with Pasquali at Ripatransone, have started experiments which, when completed, will be attended with good results. But some maintain that these experiments have not yet produced the true manual scholastic work—i. e., the work that might be taught in our elementary schools with brilliant results, judged from the didactic, educational, and hygienic point of view. I do not attempt to pronounce judgment, the more so because I have not been able to compare with my own eyes the results of the various experiments that I have mentioned above. But from what I have been able to see and from what has been told me I believe that in each of these attempts there has been a satisfactory harvest of practical results.

The minister of public instruction has therefore decided to give a certain stimulus to fresh efforts, by arranging for a number of teachers from the royal normal schools to go and attend the autumn courses held at Ripatransone, which has now become the center of the movement for the diffusion of manual instruction in our country. We may therefore expect that the experiment will continue, being sure that when these new masters know how to give manual instruction according to precise rules, it will, without further delay, form part of the curriculum of our elementary schools, which will then, and then only, have acquired the character of national schools, or schools for the people. During the last few years, too, a new branch of scholastic literature has been started amongst us—that which treats especially of manual instruction. In this branch the publications of Gabelli, Villari, and Latino certainly occupy the first place, but the accounts that Professors Pick, Tegon, Gabrielli, Borgna, and others have published on the work of the Italian commission are also worth perusal. And worthy of mention, too, are the works of Professors Goldfarelli, Pastorello, Pasquali, and others on the important subject of educational work. A monthly journal, *Il Lavoro Manuale*, has been published for some time at Milan, but the efforts of its manager and editor have not met, amongst the Italian scholastic public, with the favor they have deserved—an evident sign that the subject is for the most part premature.

I do not venture to ask myself what reception the scholastic public will give the work of Herr Salomon. I conjecture that it will at least be discussed and that from

this discussion the champions of manual work, who are not wanting even in Italy, if they take advantage of it will come out strengthened and will see an increase of their forces, which at present, however courageous they may be, are scanty in numbers. \* \* \*<sup>1</sup>

The present minister of public instruction, Comm. Guido Baccelli, is so much interested in manual training as an educative force that he has offered prizes to those teachers who introduce it into their schools and has made it an obligatory study in the practice department of the normal schools. Detailed statistics are to be required at close of the year. Two hours a week must be devoted to this study. The normal course<sup>2</sup> at Ripatransone opens on August 28 and closes on September 27. The regular programme includes (a) Froebelian exercise and exercises preparatory to feminine handiwork; (b) complete course in cardboard work as applied to elementary geometry; (c) course in potters' clay work; (d) zinc and iron work; (e) work in wood. In 1893 there were 34 men and 34 women teachers frequenting the course. Several of these teachers received Government subsidies to aid them in the study of manual training, but 7 men and 27 women teachers paid their own expenses rather than not to have the training. The men devote forty-five hours a week to manual-training work (twelve for wood, twelve for iron, twelve for paper, and nine for clay work); the women forty-two hours a week (twelve for Froebel exercises, twelve for feminine handiwork, nine for geometric work in cardboard, and nine for clay work). Examinations are held on September 23 and 24, and on September 25 and 26 there is a public exhibition of the objects completed in the course; these number from 100 to 120 for each man teacher, and from 120 to 150 for each woman teacher. Representations of the success of this work are made by the director to the minister of public instruction. The director requests continued subsidies to teachers, and also to district inspectors, so that they may interest themselves in having manual training introduced into the elementary schools of their districts. He also suggests the beginning of a library for manual-training literature.

Several times within the last ten or fifteen years projects have been formed combining Italian teachers in some sort of general association. To promote this end a congress was summoned to meet at Milan on the 3d of September, 1894. The meeting, presided over by Professor Rho, of Turin, was attended by about 500 men and women teachers. It was decided that complete organization could only be obtained by means of district federation, and a vote was passed in favor of the immediate formation of Lombardian Federation. A committee of 6 was nominated to draft a constitution of a great national federation of all teachers to be presented at the next Italian teachers' association. Later developments will be watched with interest.

<sup>1</sup> From J. S. Thornton in London Journal of Education of August 1, 1894, pp. 431-433.

<sup>2</sup> Bollettino Ufficiale del Ministro dell' Istruzione Pubblica, February 1, 1893.

A decree of Minister Baccelli, dated September 5, 1894, in favor of pedagogical conferences, ordered the holding of ten-day sessions—September 20 to 30—in the cities of Bari, Bologna, Brescia, Cagliari, Florence, Genoa, Milan, Naples, Palermo, Turin, and Venice. All teachers and officials connected with elementary education were expected to be present at the discussions to be held publicly. Academic discourses are not to be held, but opportunities are to be given to the majority of those present to enter upon a discussion of questions of general educational interest.

A congress (the third) of "Ricreatori" was held in Genoa in 1894, which body has for its object the study of the best means of ameliorating the condition of the masses, the "Ricreatori" to be an ally of the school, and to form a link between the home and school.

A congress of educators was held in Rome, September 21 to 23, 1895, the day after the anniversary of the entrance of the troops into Rome. The resolutions adopted were that "the elementary schools be made dependent on the State; that obligatory instruction be extended to 12 years of age, and that the instruction include the whole elementary school programme; that all children of public and private schools be obliged to pass a public examination; that the law regarding children at work in factories be carried out, as far as it appertains to obligatory instruction, under penalty of fines imposed on employers; that a continuation school be established either for Sundays or evenings to prepare young people for civil life who have passed the obligatory school age, and that they be obliged to remain in it until the twentieth year of age; that instruction have a scientific basis and be given according to natural methods; that in religion the schools be absolutely neutral; that patriotism be inculcated; that the school programme be so reformed as to make the teaching of history a central point toward civic education; that the hours of study be made uniform in all schools; that people's libraries be established everywhere, so that there may be an extension of the study of national history and other useful knowledge; that the moral and material conditions of teachers be ameliorated, and the minimum of salary be 1,200 francs (\$232); that no difference be made in salary given to teachers of upper or lower classes between men and women."

In the early part of 1895 an international congress for children was to be held in Florence. The questions to be discussed were the advancement of the physical, moral, and mental condition of children, the care of deaf, dumb, and blind children until they are old enough to enter an institution, the care of poor, abandoned children, and the establishment of children's hospitals.

## SCIENTIFIC AND PROFESSIONAL ORGANIZATIONS.

In December, 1891, Mr. Augustus O. Bourn, consul-general of the United States to Italy, furnished this office with a list of academies, scientific institutions, libraries, etc., within the consular district of Rome.

This list is as follows:

| Title.   | Location.    | How supported or patronized.  |
|--|--------------|---|
| Accademia Reale dei Lincei (scientific and literary).                                | Rome.....    | By the Government to the extent of 100,000 lire ( <i>a</i> ) per year.  |
| Accademia Reale di Medicina di Roma (scientific).                                    | .....do..... | By its own endowment, with additional annual subsidies of 2,000 lire from the municipality, and 5,500 lire from the Government.   |
| Accademia degli Arcadi (literary).....   | .....do..... | By its own endowments and patronage of the Pope.  |
| Accademia Tiberina (literary).....   | .....do..... | Do.   |
| Accademia dei Nuovi Lincei (scientific and literary).                                | .....do..... | Do.   |
| Accademia di Francia (fine arts).....  | .....do..... | By the French Government.   |
| Associazione Medica Italiana (medical).  | .....do..... | Entirely by contributions of its members.   |
| Associazione Farmaceutica Nazionale (pharmaceutical).                                | .....do..... | Do.   |
| Associazione Nazionale di Medici Comunali (medical).                                 | .....do..... | Do.   |
| Collegio Chimico-Farmaceutico di Roma (chemical and pharmaceutical).                 | .....do..... | Do.   |
| Comitato Medico Romano (medical).  | .....do..... | Do.   |
| Associazione Nazionale dei "Ragionieri Italiani" (auditors).                         | .....do..... | Do.   |
| Collegio dei "Ragionieri" (auditors).....  | .....do..... | Do.   |
| Società degli Ingegneri ed Architetti Italiani (engineering and architecture).       | .....do..... | Do.   |
| Società Italiani di Medicina Interna (medical).                                      | .....do..... | Do.   |
| Società Italiana di Chirurgia (surgical).  | .....do..... | Do.   |
| Società Italiana di Dermatologia e Sifilografia (medical).                           | .....do..... | Do.   |
| Società Fonografica Italiana (phonographical).                                       | .....do..... | Do.   |
| Società Stenografica Centrale Italiana (stenographical).                             | .....do..... | By the contributions of its members, and an additional annual subsidy of 500 lire by the municipality.                            |
| Società Lancisiana degli Ospedali di Roma (medical).                                 | .....do..... | Entirely by contributions of members.   |
| Istituto Storico Italiano (historical).....  | .....do..... | By the Government to the extent of 10,000 lire annually, and by contributions of members.   |
| Reale Società Romana di Storia Patria (historical).                                  | .....do..... | By its endowments, and a subsidy of 2,000 lire annually from the Government.  |
| Reale Società Didascalica Italiana (didactical).                                     | .....do..... | Do.   |
| Associazione fra gl' Insegnanti primari d' Italia (educational).                     | .....do..... | Entirely by the contributions of members.   |
| Società per la Istruzione Scientifico-letterario e Morale della Donna (educational). | .....do..... | Do.   |
| Società Letteraria dei Cattolici Tedeschi (literary).                                | .....do..... | By its own endowments and contributions of its members.   |
| Accademia Inglese di Belle Arti (fine arts).   | .....do..... | By the British Government.  |
| Accademia Belga (fine arts).....   | .....do..... | By the Belgian Government.  |
| Accademia di Spagna di Belle Arti (fine arts).                                       | .....do..... | By the Spanish Government.  |
| Insigne Accademia Romana di Belle Arti denominata di San Luca (fine arts).           | .....do..... | By its own endowments.  |
| Regia Accademia di Santa Cecilia (musical).  | .....do..... | With annual Government subsidy of 40,000 lire, with annual subsidies of 30,000 from the municipality and 5,000 from the province. |
| Real Accademia Filarmonica, Roma (musical).  | .....do..... | Partly by endowments and partly by contributions of members.  |
| Società Orchestrale Romana (musical)....   | .....do..... | Entirely by contributions of members and proceeds of its concerts.  |
| Società del Quintetto (musical).....   | .....do..... | Do.   |
| Collegio e Scuola Gregoriana (musical)....   | .....do..... | By its endowments and tuition paid by students.   |

*a* The lira is 19.3 cents in value.

| Title.   | Location.          | How supported or patronized.   |
|--|--------------------|--|
| Congregazioni Artistica dei Virtuosi al Pantheon (musical).            | Rome.....          | By its endowments and tuition paid by students.  |
| Studio e Fabbrica di Mosaici (mosaics).....                            | do.....            | By its own endowments and patronage of the Pope.   |
| Studio e Fabbrica di Arazzi (tapestry).....                            | do.....            | Do.  |
| Regio Istituto di Belle Arti in Roma (fine arts).....                  | do.....            | By the Government to the extent of 79,500 lire per year.   |
| Regia Calcografia (engraving).....                                     | do.....            | By the Government to the extent of 16,500 lire annually.   |
| Accademia Pontificia di Archeologia (archeology).....                  | do.....            | By its endowments and patronage of the Pope.   |
| Società Romana d'Incoraggiamento per gli Artisti (fine arts).....      | do.....            | Entirely by the contributions of its members.  |
| Associazione Artistica Internazionale (fine arts).....                 | do.....            | Do.  |
| Società degli Amatori e cultori di Belle Arti (fine arts).....         | do.....            | Do.  |
| Società degli Acquarellisti (fine arts).....                           | do.....            | Do.  |
| Associazione degli Amatori di Fotografia in Roma (photographical)..... | do.....            | Do.  |
| Società Musicale Romana (musical).....                                 | do.....            | By proceeds of its concerts and contributions of members.  |
| Società Italiana delle Scienze dette dei XI (scientific).....          | do.....            | By its own endowments.   |
| Società Geologica Italiana (geological).....                           | do.....            | Do.  |
| Comitato Geologico d'Italia (geological).....                          | do.....            | Do.  |
| Società Geografica Italiana (geographical).....                        | do.....            | By the Government, with 50,000 lire annually, and by contributions of members.                       |
| Società Archeologica Anglo-Americana (archeological).....              | do.....            | Entirely by contributions of members.  |
| Imperiale Istituto Archeologico Germanico (archeological).....         | do.....            | By the German Government.  |
| École Française de Rome (archeological).....                           | do.....            | By the French Government.  |
| Associazione della Stampa Periodica in Italia (press association)..... | do.....            | By the contributions of members.   |
| Regia Università di Roma.....  | do.....            | By the Government, with 1,085,096 lire annually.   |
| Università Israelitica di Roma.....                                    | do.....            | By endowments.   |
| Regia Università di Cagliari.....                                      | Cagliari.....      | By the Government, with 162,818 lire per year.   |
| Regia Università di Sassari.....                                       | Sassari.....       | By the Government, with 143,403 lire per year.   |
| Regia Università di Macerata.....                                      | Macerata.....      | By its own endowments and an annual Government subsidy of 25,811 lire per year.                      |
| Università di Perugia.....   | Perugia.....       | By its own endowments.   |
| Università di Urbino.....  | Urbino.....        | By its own endowments and an annual Government subsidy of 1,723 lire per year.                       |
| Università di Camerino.....  | Camerino.....      | By its own endowments.   |
| Regia Istituto di Marina Mercantile.....                               | Cagliari.....      | By appropriations from the Government, varying from year to year.                                    |
| Regio Istituto Tecnico.....  | Perugia.....       | Do.  |
| Regio Istituto Tecnico.....  | Camerino.....      | By the municipality and the province to the extent of 8,334 lire and 5,000 lire respectively.        |
| Regio Istituto di Marina Mercantile.....                               | Ancona.....        | By appropriations from the Government, varying from year to year.                                    |
| Regia Scuola Normale.....  | Ancona.....        | Do.  |
| Regia Scuola Normale.....  | Pesaro.....        | Do.  |
| Regia Scuola Normale.....  | Macerata.....      | Do.  |
| Regia Scuola Normale.....  | Ascoli-Piceno..... | Do.  |
| Regia Scuola Normale.....  | Urbino.....        | Do.  |
| Regia Scuola di Applicazione per gli Ingegneri.....                    | Rome.....          | By the Government to the extent of 165,993 lire per year.  |
| Regio Liceo Ginnasio Umberto I.....                                    | do.....            | By the Government, variable appropriations, and by the municipality 13,000 lire per annum.           |
| Regio Liceo Ginnasio Ferenzio Mamiani.....                             | do.....            | By the municipality, with 4,000 lire per annum, and variable appropriations from the Government.     |
| Regio Liceo e Ginnasio Quirino Visconti.....                           | do.....            | By appropriations from the Government, varying from year to year.                                    |
| Regio Istituto Tecnico Leonardo da Vinci.....                          | do.....            | By the municipality, with 8,000 lire per annum, besides variable appropriations from the Government. |
| Regio Istituto Superiore di Magistero Femminile.....                   | do.....            | By appropriations from the Government, varying from year to year.                                    |
| Istituto Aradico.....  | do.....            | By its own endowment.  |

| Galleria e Museo dell' Università di Perugia.....      | Perugia..... | By the University of Perugia.                                   |

## MEMORABLE DATES.

The territory known to-day as Italy has been subjected to the domination of Spain, France, and Austria at different periods of its history. Spanish rule predominated during the sixteenth and seventeenth centuries; Austrian at the beginning of the eighteenth; the French victories changed the Government between 1797 and 1814; Austrian rule was reestablished in 1814. In 1848 the Milanese and Venetians joined Piedmont; in 1859 the Austrians lost their hold, and the Kingdom of Italy, comprising Piedmont, Sardinia, Lombardy, Tuscany, Modena, Parma, the Romagna, Naples, and Sicily, was formed. In 1866 Venetia was ceded to Italy by Austria, and the kingdom was consummated, with Rome as its capital, in 1870.

In the Middle Ages and during the Renaissance Italy was the most brilliant center of literature and art in Europe. From the sixteenth to the eighteenth century, however, popular education—if one excepts a few celebrated institutions—was not greatly developed. The ministers and princes of the eighteenth century, animated with a spirit of reform, opened schools, notably the Emperor Joseph II, in Lombardy, by edict of 1786. During the period 1797–1814, when political affairs brought Italy and France more closely together, the obligation of maintaining elementary schools was imposed upon the communes of the Cisalpine Republic (1802) and the Kingdom of Naples. The fall of the

French Empire paralyzed educational efforts. Later, liberal ideas inspired the law of 1819 in the Neapolitan realm, the school regulations of 1818 in the Lombard-Venetian Kingdom, the decree of 1822 in the Sardinian States, which required each commune to maintain a gratuitous elementary school. The most memorable dates from the educational standpoint are the following:

- 1729 and 1772. Establishment of famous royal constitutions by princes of the House of Savoy through which the control of secondary education was taken away from the religious orders, and the Collegio delle Province, with one hundred free scholarships, was established with the aim of preparing, in connection with the university, teachers qualified to give this instruction. Schools of methods were established to prepare teachers for primary schools, and with the title of *Magistrato della Riforma* the germ of a well-organized council of public instruction appeared.
- 1786. Reorganization of rural schools in Lombardy, the decree stipulating for free schools for the poor.
- 1802. Sub-Alpine republics decreed that all communes should establish elementary schools.
- 1808. Schools reorganized in parts of Italy under French domination. Academies established at Turin, Genoa, and Pisa as integral parts of the University of France.
- 1813. Reorganization of public instruction in Rome.
- 1818. New school law promulgated in the Lombardian-Venetian Kingdom which in 1822 became the code of education for that part of Italy.
- 1844. Establishment of "*Asili d'Infanzia*" (infant schools) in Piedmont, which were the beginning of the well-organized school system.
- 1847. (Decree of November 30.) Office of minister of public instruction created.
- 1849. Establishment of "*Società d'Istruzione e d'Educazione*" in Lombardy-Venetia, which has been of great assistance in the organization of the present public school system.
- 1859. Promulgation of the "*Legge Casati*," or school law, named from the minister of public instruction at that date, which forms the basis of the present school system, as it provided that each commune should maintain an elementary school, that teachers should have certificates of capacity, that there be greater strictness in university examinations, etc.
- 1867. Religious corporations abolished and their schools classed as private. Other modifications of law of 1859 made.
- 1877. Instruction made obligatory for children between 6 and 9 years of age.
- 1878. Gymnastics placed on school programmes.
- 1881. Legal enactments reorganizing higher council of education and making changes in school supervision.
- 1885 and 1886. Legal enactments bearing upon teachers' salaries and teachers' licenses.
- 1887-1894. Reform movements in university education presented from year to year with intention of strengthening the larger university centers and abolishing others; commissions appointed to study subjects of physical education, textbooks, reform in elementary school programmes, etc. The "*licenza elementare*" was introduced in 1882, abrogated by Minister Villari in 1891, and reintroduced by Minister Baccelli in 1894. The minister of public instruction has revived his former scheme for bringing primary and secondary schools into relation with each other. Boys who have reached the fifth class of a primary school and can pass a qualifying examination receive a certificate which allows them to enter a secondary school without further difficulty. The "*licenza liceale*" is to be conferred, from 1894 on, upon students of "*ginnasi*" and "*licei*" who have successfully passed the required examinations.

## INDEX TO EDUCATIONAL INFORMATION ABOUT ITALY.

- The reports of the Commissioner of Education, from the year 1870 on, have contained information in regard to education in Italy. In the earlier years it was very meager; of late years more complete. An index of the matter is here presented. Annual Reports of Commissioner of Education.
- Medical schools, course of study in (1 to 6 years); industrial schools in 1868, statistics of. 1870, pp. 390, 442.
- Main points of school law (4 lines); statistics of schools, 1864-1868. 1871, p. 473.
- Detailed statistical presentation for 1871-72 of all grades, with statistics of special schools. 1872, pp. 496, 504.
- Tabulated statistics of universities; statistics of elementary and secondary education in 1872; evangelical school work; expenditures; illiteracy and penal institutions. 1873, pp. clxi-clxiii, clxxxv.
- Statistics for 1874; text with expenditure. 1874, pp. cxxxvii-cxxxviii.
- Students in Government and free universities in 1877; primary education compulsory; other statistics. 1875, 1876 (unimportant item); 1877, p. clxvi.
- Tabulated statistics of universities in 1877-78; education again made compulsory by law of July 15, 1877; technical schools supported by Government communes, religious corporations, and private persons; general statistics. 1878, pp. clxvii-clxviii.
- Italian educators sent abroad to study school systems of other countries; education by religious orders, 16,000 priests and members of religious orders being engaged in teaching in Italian schools. 1879, p. cxevi.
- Statement in tabulated form of illiteracy in 1861-1871, and of elementary schools and pupils from 1861-1879; of adult schools, female boarding schools, etc. This is prefaced by a statement regarding the present constitution of Italy, the fundamental law of public instruction, teachers' salaries, and the school budget. 1880, pp. ccxv-ccxx.
- Bill (of November 12, 1881) introduced to enforce school attendance of persons 14 to 16 years of age. 1881, p. cclviii.
- Statistics presented in tabulated form of schools, both private and public, for 1861-1881, with appropriations from 1871-1873, and a comparison made with other countries of Europe as to amounts appropriated; references are made to school law of 1877, which made instruction obligatory, and the number of communes carrying out the law are indicated. 1882-83, pp. ccxxx-ccxxxiv.
- Presentation of statistics for 1881-82, in which it is shown that out of 1,735,185 pupils registered only 232,929 presented themselves for examination, and only 166,185 passed satisfactorily. Reasons: Poor quality of teachers, poverty of people. Contents of circular of October, 1882, include examination from grade to grade, pupils graduating from third grade to attend evening school for a year, school inspectors to furnish annual list of children of school age to syndic, etc. 1883-84, p. ccxxvii.
- Statistics for elementary schools are presented from official reports for 1882-83, the second and higher schools for 1883-84. The length of the course of study in most institutions is given. The expenditures by State, provinces, and communes for elementary education are also presented. Illiteracy (in 1881) in different parts of Italy is also indicated. 1884-85, pp. ccxc-ccxcii.
- Statistics: Schoolage; population; enrollment in elementary schools; teachers; normal schools; expenditures; university statistics. 1885-86, pp. 726-732.
- Statistics of educational periodicals: Number of volumes, date of issue, how often published, price. Elementary statistics (as above): Name and title of chief officer of education. 1886-87, pp. 978, 1000-1004.

1887-88, pp. Educational periodicals tabulated as above; statistics for 1884-85 of elementary and normal schools.

1888-89, Vol. I, Course of study in normal schools; population and enrollment; elementary school statistics; religious instruction; school savings banks. First presentation of the school system, its general features; memorable dates in history; State and local supervision; teachers, their salaries and appointment; school management and organization; museums and libraries; statistical table.

1889-90, Vol. I, Statistics of enrollment: Ratio to population; per capita of population; pay or free schools. Diagrams: Ratio to population under school influence; universities, their foundation, number of students in 1890-91. Provision for industrial education. Character of exhibits at Milan exhibition for education and hygienic appliances; information appertaining to progress of education (one-half page); table of enrollment, expenditures, per capita of population and enrollment for 1888-89.

1890-91, Vol. I, The report for 1890-91 contains an essay on education in Italy by Prof. A. Oldrini, with supplementary matter by Signor Com-mendatore Bodio, the director of the statistical bureau in Rome.

These essays on education in Italy include information concerning illiteracy—courses, percentages: Kindergartens, primary education, progress of schools since enactment of law for compulsory education in 1877. Secondary education (ginnasi and licei, technical schools and institutes): Rural, agricultural, industrial, and normal schools. Superior and special instruction: Universities, programmes and pending reforms, special schools and academies, academic institutes. Fine arts; libraries; the press; budget of public instruction in 1889-90. Information supplementary to above: Illiteracy in 1891 by territorial subdivision; infant schools; elementary education in 1871-72, in 1881-82, and in 1891-92; normal schools; secondary schools; statistics for different years; education of women; agricultural education; industrial, professional, and commercial education. Superior and special studies; academies of science and literature, fine arts, museums, antiquities, national monuments, libraries with statistics to 1890-91. Publications according to subject-matter. General provincial and municipal school administration. Maintenance and expenditure for educational institutions in 1889. Statistical presentation of youth below universities, in elementary, secondary, and higher schools, with percentages; expenditures per capita of pupils and population. Legal education, with statistics of law schools. Growth of the kindergarten.

An. Rep. 1891—No information from Italy.

92. An. Rep. 1892—Expenditures; school attendance; Cavour's efforts; compulsory education; instruction in agriculture; education of women; schools for soldiers; music and the fine arts; medical requirements; statistics of education.

An. Rep. 1893—Monograph on public instruction in Italy, by Prof. B. A. Hinsdale.

94, pp. 325-383. Topical outline: Unification of Italy; educational conditions in 1861; general political facts; the Casati law and the administration of public instruction; description and statistics of different grades of schools, from kindergarten to university and special schools; the school supply; teachers; financial status; public schools of Rome during twenty years; warfare against illiteracy; summary and conclusion.

## CHAPTER XIII.

### REPORT OF THE ROYAL COMMISSION ON SECONDARY EDUCATION.

---

**TOPICAL OUTLINE.**—*Constitution and purpose of the commission.*—Principal recommendations: The central authority; the new local authority; the registration of teachers.—Additional recommendations: Means of increasing the efficiency and extending the province of existing secondary schools; service of inspection and examination; classification and curricula; coeducation; noninterference with religious convictions; stable policy as regards the salaries of assistant teachers.—Provision for classes not at present reached by secondary schools by means of scholarship funds; classes; mode of obtaining; value; means of restricting.—Financial resources of secondary schools.—Number of secondary students.—Extracts from the historical sketch: Preceding commission.—Recommendations of the Schools Inquiry Commission.—Legislation growing out of the same.—Agencies for fostering secondary instruction; public, private (voluntary).—The State as a factor in secondary education.—Considerations relating especially to the secondary education of girls.—Women as administrators of public trusts.—Digests of evidence by representative witnesses summoned before the commission.

#### CONSTITUTION AND PURPOSE OF THE COMMISSION.

As regards England, the event of most importance in educational circles is the publication of the report of the royal commission on secondary education. The commission was appointed in March, 1894, and has accomplished its work with unusual dispatch. One hundred sessions were held, 85 witnesses examined (besides a great number of returns), and the report was ready to be submitted to Government in August, 1895. All educational interests—the universities, secondary schools, private and endowed elementary schools, school boards, teachers' associations, etc.—were represented in the membership.<sup>1</sup> More-

---

<sup>1</sup> The members were as follows: Mr. James Bryce, chairman; Sir John Hibbert, secretary to the treasury; Hon. Edward Lyttelton, M. A.; Sir Henry Enfield Roscoe, D. C. L.; Dr. Edward Craig Maclure, D. D.; Andrew Martin Fairbairn, D. D.; Prof. Jebb. Litt, D. D., C. L.; Dr. Wormell, D. Sc.; Mr. Henry Hobnouse, M. A.; Mr. M. E. Sadler, M. A.; Mr. H. Llewellyn Smith, M. A.; Mr. M. G. Cockburn, chairman of the Leeds school board; Mr. C. Fenwick, Mr. James Henry Foxall, Lady Frederick Cavendish, Mrs. Sophie Bryant, D. Sc.; Mrs. Eleanor Mildred Sidgwick.

over, it was distinguished from all preceding commissions by the presence of women. The royal commission is the third appointed to deal with secondary education since 1860, at which time the Government began to turn its attention seriously to the subject. The necessity for the commission arose from conditions that are inherent in the educational policy of Great Britain—first, a multiplicity of unrelated agencies with consequent overlapping and waste of resources; second, unequal distribution of schools and, more especially, inadequate provision for the secondary education of the poorer classes. This confusion and inequality, corrected in some directions by legislation growing out of the recommendations of the commission of 1864, has been aggravated in others by impulses from the same source.<sup>1</sup> The commission was charged to devise measures for overcoming these evils. In the language of their order, they were—

to consider what are the best methods of establishing a well-organized system of secondary education in England, taking into account existing deficiencies and having regard to such local sources of revenue from endowment or otherwise as are available or may be made available or may be made for this purpose, and to make recommendations accordingly.

The persons examined by the commission represented all the various agencies and the clashing interests affected by the inquiry, together with a fair number of impartial but experienced witnesses; the digests of evidence appended<sup>2</sup> give a graphic picture of the peculiar complications with which the commission had to deal; their own report, with the recommendations, illustrates in a very striking manner the traditional conservatism of English policy.

#### PRINCIPAL RECOMMENDATIONS OF THE COMMISSION.

The immediate outcome of the labors of the commission is found in their recommendations. While discussing incidentally phases of secondary education not distinctly named in their instructions, they kept always in view the specific purpose of their mission, and their recommendations, presented under five heads and comprising 160 propositions, all relate either to organization or to the means of increasing the provision or efficiency of secondary instruction.

Three distinct departures from the present policy are involved in these recommendations. Two of these pertain to organizing authorities, the third to the efficiency of instruction. Briefly stated, these are: (1) The recommendation to create a ministry of education, i. e., "a department of the executive government, presided over by a minister responsible to Parliament, who would obviously be the same minister as the one to whom the charge of elementary education is intrusted;"<sup>3</sup> (2) the constitution of a new local authority for secondary education;

<sup>1</sup> See extract from Historical Sketch, Report of the Commission, vol. 1, on page 598.

<sup>2</sup> See pp. 605.

<sup>3</sup> Report of commission, vol. 1, p. 257.

(3) a scheme for the registration of teachers applicable to teachers of all classes.

While these measures are departures, they make no violent break with the past; they are one and all in the line of recommendations made by the commission of 1864,<sup>1</sup> and have been formally proposed to Parliament from time to time, notably the proposition for a ministry of education, which seemed very near realization during Mr. Mundella's administration of the department of education.

*The central authority.*—If constituted in the manner recommended, the ministry would be simply an expansion of the education department, with absorption of the science and art department and a transfer from the charity commission of the duty of dealing with educational endowments controlled by the law of 1869.

The minister would be assisted by a permanent secretary familiar with all the details of the system. Little direct executive power would be entrusted to the central authority; its function would not be "to control, but rather to supervise," not to override or supersede local action, but to bring about "harmony and cooperation" among the various local agencies. With respect to the constitution of local bodies, the revisions of schemes for endowed schools, the location of new schools, the conduct of examinations and inspection, and in general in questions of dispute between local authorities, the central body would have large advisory and judicial scope. It would moreover have general control of all State funds for education and of nonlocal endowed schools and power to constrain local authorities to make due provision for secondary education.

The need of professional advice in respect to nearly all the questions which would come before the minister is distinctly recognized, and is met by an educational council somewhat similar to the French superior council of public instruction. In recommending this feature the commissioners observe:

There will be some matters, however, in which the counsel of persons specially conversant with education and holding an independent position may be so helpful, and there will be some duties in their nature so distinctly judicial rather than executive, as to make it desirable to secure for the minister the advice of persons not under his official direction. There will, moreover, be some work to be done in a central educational department so purely professional as to belong rather to an independent body than to a department of state. For these purposes we propose that there be created an educational council which may advise the minister in the first-mentioned class of matters and in appeals, while such a professional function as the registration of teachers might be entirely committed to it.<sup>2</sup>

The council would be much smaller than the French council (12 members as against 60), the same to be appointed or chosen as follows:

One-third appointed by the Crown, one-third by the four universities of Oxford, Cambridge, London, and Victoria (1 member by each), and one-third selected by the

<sup>1</sup> See extracts from Historical Sketch, p. 598.

<sup>2</sup> Report of Commission, vol. 1, p. 258.

rest of the council from among experienced members of the teaching profession. The term of office is put at six years, and arrangements ought to be made which would prevent all the members from going out of office at the same time, so as to secure the continuance and transmission of experience and a certain permanence of policy.

#### THE NEW LOCAL AUTHORITY.

The question of organizing and unifying local authorities was much more intricate than that of the constitution of a central authority. Existing agencies having vested interests and charter rights could not be ignored; jealousies and opposition were sure to be stirred up whatever new agency might be proposed. Two public representative bodies are already in the field, one the elected school boards, whose function is purely educational; the other, the county and county borough councils, created by the local government act of 1888. The former, although legally confined to elementary education, have brought about an "extension of the parliamentary grant to higher grades," in fact have shown their ability to organize high schools. In rural districts, however, school boards are not at present available. As determined by the education law of 1870, the district for the election of a board (except in the metropolis) is either (1) a municipal borough or (2) a civil parish. The population with which a school board deals varies anywhere from less than 250 to 5,000 and upward. Fully 23 per cent of the districts, chiefly rural, comprising nearly one-third of the total population, have had no election of boards. It is in the great commercial and manufacturing centers that their influence has been powerful.

The county and county boroughs are permanent administrative areas recently created to avoid just such complications in other civil affairs as are now embarrassing education. In accordance with the local government act of 1888, England and Wales were divided into 60 administrative counties and 61 county boroughs, having each more than 50,000 inhabitants. These, with the county of London, which was treated distinctly, made 122 new areas for local self-government. The supreme authority in each area is a council elected every three years. The right to levy a rate of a penny in the pound for technical education, conferred upon the councils by a law of 1889, and the act of the following year placing at the disposal of the councils the surplus of the duties on spirits, about \$3,000,000 annually, with the privilege of applying the same to education, made the councils the chief public agents for fostering secondary education. In the boroughs they are not more powerful than the school boards; their supremacy is in the rural areas.

So much is necessary to understand the sense in which the new agency recommended by the commissioners is simply a compromise. According to the recommendation there would be "a new local authority for secondary education in every county and in every county borough, that is to say, speaking generally, in boroughs with a population exceeding 50,000." This body, which for convenience may be

termed a county or a county borough board, would comprise not less than 14 nor more than 42 members. The composite character of the boards is illustrated in the typical cases presented in the report:

Taking 28 as the number for one of the larger counties, the body would be formed somewhat as follows:

|                                    |    |
|------------------------------------|----|
| Chosen by the county council ..... | 16 |
| Chosen by the central office ..... | 4  |
| Co-opted by the above .....        | 8  |

and of the 12 not chosen by the county council several ought to be taken from persons actually or recently engaged in teaching.

Members appointed by a county council ought to hold office for the term of office of the council; other members for a term of five years.

The county borough authority, comprising from 12 to 24 members, would be formed as follows:

The borough council and the school board should each appoint one-third of the members, being free to select those persons either from within or from without its own body. Of the remaining one-third of the members, one-half, or one-sixth of the whole, ought to be nominated by the central office after communication with any university or university college or colleges which may be situate sufficiently near the borough or may otherwise be so connected with it as to be capable of influencing its education. Should the borough, however, contain a university college, this one-sixth of the whole might be left to be appointed directly by that college. The other one-sixth of the whole ought to be co-opted by those previously chosen.

#### The commissioners add:

Here, as in the case of the county authority, we think that the power of co-optation and that of appointment by the central office may fitly be required to be used so as to secure for the local authority the benefit of that special experience which teachers possess.

Members appointed by the borough council ought to hold office for three years; those appointed by the school board for the term of the board that appointed them; other members for five years.

On account of the important agencies already operating in London, a special constitution of the local authority is recommended as follows:

|  |    |
|--|----|
| Appointed by the county council .....                                | 18 |
| Appointed by the school board .....                                  | 7  |
| Appointed by the City and Guilds Institute .....                     | 2  |
| Appointed by the city parochial charities trustees .....             | 2  |
| Appointed by the universities of Oxford and Cambridge (1 each) ..... | 2  |
| Appointed by the University of London .....                          | 2  |
| Co-opted by the other members .....                                  | 9  |
| Total .....  | 42 |

Here again the commissioners emphasize the importance of having the teaching profession well represented, and, further, that a certain number of the members "be selected from among persons possessing special knowledge of London industries, whether as employers or as workmen."<sup>1</sup>

<sup>1</sup> Report of commission, vol. 1, pp. 268-271.

It is significant that the commissioners specially urge the appointment of women on these local boards. They say:

We think that women ought to be eligible for appointment (whether by a public authority or by cooptation) upon both sets of authorities, and that it is, indeed, desirable to provide that a certain number shall be women, as experience seems to have shown that the interests of girls often receive insufficient attention, and that there is also a risk that women may not be chosen unless some special provision for their presence be made.<sup>1</sup>

The functions of the new local authorities, as briefly epitomized by the commissioners, would be—

(1) The securing of a due provision of secondary instruction.

(2) The remodeling, where necessary, and supervision of the working of endowed (other than nonlocal) schools and other educational endowments.<sup>2</sup>

(3) A watchful survey of the field of secondary education, with the object of bringing proprietary and private schools into the general educational system, and of endeavoring to encourage and facilitate, so far as this can be done, by stimulus, by persuasion, and by the offer of privileges and advice, any improvements they may be inclined to introduce.

(4) The administration of such sums, either arising from rates levied within its area or paid over from the national exchequer, as may be at its disposal for the promotion of education.<sup>3</sup>

None of these functions, however, is to be arbitrarily exercised. While on the one hand the local authority will be constrained by the central to see to it that the provision of secondary instruction in its area is sufficient, on the other, its measures, whether for the remodeling of old schools or the creation of new, will be subject to the revision of the central authority. The endowed or publicly supported schools which come under the jurisdiction of the local authority will remain under the immediate charge of their own administrative bodies, and although any local authority giving aid to such schools is entitled to representation on the governing body, the representation will be carefully limited.

The endowments with which the local authority may deal yield about £830,000 annually for education—the proceeds from the duties on spirits, about £748,000, to which would be added £650,000 if the local authority universally exercised its right to levy an education tax. This would give a sum of about \$10,750,000. This power of the purse would not be unlimited, as the accounts of the local authority are “to be annually audited by some person appointed by a department of Government.”

It should be noted that the seven<sup>4</sup> great public schools of England are not included in the educational endowments with which the local authority would deal. These, however, would be brought within the

<sup>1</sup>Vol. 1, p. 272.

<sup>2</sup>See Digests of Evidence, p. 605.

<sup>3</sup>Vol. 1, pp. 272, 273.

<sup>4</sup>These are colleges of Eton and Winchester and the schools of Westminster, Charterhouse, Harrow, Rugby, and Shrewsbury.”

scheme for coordinating secondary schools through the supervisory powers conferred upon the central authority.

Provision is made for bringing private schools under the general supervision of the local authority by extending to them "the benefit of public examinations and of scholarships and other auxiliary funds supplied from public sources, in return for which they would be expected to submit to a certain amount of public supervision." Moreover, in respect to a matter intimately concerning the public welfare—sanitary inspection—the commissioners recommend that the local authority be empowered to cause all schools, whether endowed (or in any other sense public), proprietary, or private, within its area to be inspected as respects the sanitary condition of their buildings and class rooms, and to require them to conform to such general regulations for securing health as may be issued by the central office, which, in case of refusal to so conform, should have power to direct any insanitary school buildings to be no longer used for school purposes, subject, however, to an appeal on the part of the owner or occupier of such buildings to the central office.<sup>1</sup>

#### THE REGISTRATION OF TEACHERS.

The cautious treatment of the province of local authorities is in striking contrast to the decided policy advocated by the commissioners in respect to the registration of teachers. Here they have gone directly against the narrow prejudices which have isolated elementary education from the higher grades. They stand for the unification of all scholastic work and the placing of all teaching on a distinctly professional basis.

Their proposition is simple, namely, that there shall be one register, open alike to all teachers, from a private governess to a head master, provided they fulfill the required conditions. These are: (1) A degree, or a certificate of general attainments, granted by some university or body recognized for that purpose by the registration authority and accepted as satisfactory by that authority; and (2) a certificate or diploma of adequate knowledge of the theory and practice of education granted by a university or body recognized as above;<sup>2</sup> that is, scholarly attainment and professional training.

In elaborating their views they make it clear that they have secondary teachers chiefly in mind; for instance, they propose to relax the severity of the admission standard in the case of "persons who have been engaged in teaching in secondary schools for three years before the passing of the act who produce to the educational council satisfactory evidence of intellectual acquirements and competence to teach."<sup>3</sup> And again they advise "that, after the lapse of a reasonable time—say, seven years after the establishment of the register—no unregistered

<sup>1</sup> Vol. 1, p. 278.

<sup>2</sup> Vol. 1, p. 319.

<sup>3</sup> Ibid., p. 320.

person should be allowed to be appointed as a teacher of a public secondary school or of a school recognized by the local authority as contributing to the supply of efficient secondary education."<sup>1</sup>

There is nothing, however, to exclude elementary teachers from the register, and the proposition as it stands is regarded as a victory for that class. The National Association of Elementary Teachers has long contended for such a measure, and before the commission their representatives urged it with great and evidently convincing force. We may trace also an influence from the elementary system in the commissioners' demand that teachers shall have professional training. While not committing themselves to any particular policy in this respect, they evidently regard the universities as the proper centers for this work.

As regards general education they say, unreservedly, teachers "will obtain it, and in our view ought to obtain it, not in special seminaries, but in the same schools and universities as are resorted to by persons desiring to enter the other professions."<sup>2</sup>

As regards professional training, which the commissioners hold should include "both a theoretical and a practical side," they would not intrust the provision to "local authorities, because their sphere of action is not sufficiently wide," nor, on the other hand, "to the central office, because that might induce an undesirable uniformity," but in the interests of freedom and variety would urge the universities "to take up the task, as has been done in two Scottish universities, and very recently in Durham." They add: "If the science of education is to make good the claims put forward on its behalf, it ought to be studied where other branches of mental and moral philosophy are fully handled by the ablest professors. In speaking of universities we include the leading university colleges."<sup>3</sup>

The dignity, independence, and uniformly high standard of the registration is secured by committing it wholly to the educational council.<sup>4</sup>

#### ADDITIONAL RECOMMENDATIONS.

The most important question before the Commission was that of extending the provision of secondary education. This is indeed the purpose in view in the creation of new organizing authorities, and it is evidently the sense of the commission that the actual means of accomplishing the end desired must be left to the judgment of these authorities exercised in view of particular circumstances. However, under the general head of "Arrangements for the better organization of schools," the commissioners deal more directly with the problem of increasing both the efficiency and the quantity of secondary instruction.

For a complete understanding of the recommendations under this head it would be necessary to consider the constitution of existing schools more fully than is here desirable. I shall, therefore, note only certain suggestions or opinions of very general interest.

<sup>1</sup> Vol. 1, p. 320.

<sup>2</sup> Ibid., p. 321.

<sup>3</sup> Ibid., p. 323.

<sup>4</sup> See Historical Sketch, p. 598.

## MEANS OF INCREASING THE EFFICIENCY AND EXTENDING THE PROVINCE OF SECONDARY SCHOOLS.

*Service of inspection and examination.*—In discussing the functions of the new local authorities the commissioners specify in particular the maintenance of a service of inspection.

It will be desirable [they say] that the central office should issue a list of persons qualified by professional experience or otherwise specially competent to act as inspectors, and that local authorities, who may often with advantage combine for this purpose, should either select from this list those whose services they need or from time to time may submit to the central office for its approval the name of some other person whom they wish to be permitted to employ. As in our view it is better that the power of inspection should rest with the local rather than with any central authority, we conceive that it is by the local authority the inspector should be chosen, though the difficulty such an authority may experience in finding fit men points to the formation of such a list as we have suggested.

They are particular also to make it clear that the inspection contemplated is something different—

from the inspection maintained in the elementary schools. All that they deem necessary for the local authority to secure is a report from a competent hand upon the general condition and equipment of each school, including particularly the number and qualifications of the teaching staff.<sup>1</sup> \* \* \*

Returning again to this subject when discussing the actual organization of schools, the commission observes further:

In selecting persons for these posts great weight ought to be given to previous experience in teaching; and duly qualified women should be chosen where there is likely to be sufficient work for them. The appointment of such inspectors should, we think, be made independent of any limit of age. This rule, which is contrary to the present practice of the education department, would often enable the local authority to secure a man of greater educational experience than can be done under the present system. The local authority should have power to appoint a separate inspector to conduct the sanitary inspection if they prefer so to do.<sup>2</sup> \* \* \*

Where there is a scheme [for carrying out the terms of an endowment] the inspector should see that its various requirements as to the constitution and meetings of the governing body, the keeping of accounts, scholarships, examinations, etc., have been duly complied with. He should also in all cases require the production of the school time-table, and see that it sufficiently provides for instruction in the subjects of the curriculum as presented by the scheme. He should satisfy himself that the teaching staff of the school is sufficient both in number and attainments for the work that it claims to do, and that the equipment and apparatus are suitable and sufficient. It would further be desirable that he should also be present at the teaching of, at any rate, the principal classes, so as to form a just appreciation of the practical qualifications of the teachers, without in any way interfering with the course of instruction given.<sup>3</sup>

With respect to the last point, the commissioners are careful to add:

In view of the disquiet which a general enforcement of such a rule might at first excite, we are not prepared to say that this should be deemed essential.<sup>4</sup>

<sup>1</sup> Report of commission, vol. 1, p. 279.

<sup>2</sup> Ibid., p. 306.

<sup>3</sup> Vol. 1, p. 305.

<sup>4</sup> Ibid., p. 279.

Examination is treated as a separate service.

Each school or a certain portion of the scholars, the commissioners urge, should be annually examined by some independent and competent person, but this may under proper regulations (to be framed by the central office) be allowed to be done at the instance of the schools themselves.

It is of interest to note in this connection that in respect to the means of determining the efficiency of secondary schools the commission sought to profit by the experience of other countries. From France and Germany, in particular, memoranda were obtained setting forth very fully their policies in this respect. The measures finally recommended by the commissioners, however, show little tendency to copy from these, and are evidently framed with a careful regard to the independence and individuality which is the pride of English secondary schools.

*Classification and curricula of schools.*—Coming directly to the subject of school provision, the commission consider first the classification of secondary schools. According to English ideals this is inextricably involved with differences of curricula arising from the different social conditions of students. So far from recommending a uniform course upon which all secondary students should enter, the commission recognize the necessity of distinguishing between students of the "humble stratum, who must leave school at about 14 years to earn their living in shops or warehouses, or in some industrial occupation;" "those who will remain till about 16 and then enter upon professional courses or the higher walks of communal life," and those who remain till about 18 years of age and are likely then to enter the universities. In this classification they follow, although with confessed reluctance, the lines laid down by the commission of 1864.<sup>1</sup> As regards the actual curricula for these three types, under a due regard for the traditional independence of English headmasters they refrain from any explicit instructions. Their general conception of the scope of secondary studies is expressed as follows:

It is agreed—

That besides that literary and humanistic course of instruction, based upon the languages of classical antiquity which tradition has established among us, and whose incomparable value no thoughtful man denies, ample provision must be made in schools for scientific teaching, beginning if possible with natural history and the other sciences of observation and working up into chemistry and physics. It is further agreed that mathematics, while more closely allied to scientific subjects, ought to enter also into a literary course; that the chief tongues of modern Europe ought to be studied, not only as instruments of linguistic training but as the keys to noble literatures; and that full opportunities to boys and girls to prepare themselves for the particular occupations which they intend to follow in after life, whether industrial or commercial, ought to be supplied by the teaching of the practical arts, such as the elements of applied mechanics and the subjects connected with agriculture, as well as of modern languages and of the kinds of knowledge most useful to the merchant or trader. These three elements, however, which we

---

<sup>1</sup> Vol. 1, pp. 282, 283.

may call the literary, the scientific, and the technical, may be combined in a great variety of forms and proportions. Experience alone can show which forms and which proportions are most likely to be absolutely best—we will not say as a scheme of intellectual training, but even as fitted to the needs of particular classes of persons inhabiting particular areas and engaged in particular kinds of industry. \* \* \*

Each of the three elements above named has vigorous forces behind it. Not merely tradition, but the influences of imagination and philosophy commend the first. The second is strong in the pride of its recent triumphs and still swift advance. The sense of its practical utility in days when industrial and commercial competition grows constantly more severe is enough, perhaps more than enough, to secure its rightful place for the third. All have in one view a claim to be considered in the course of studies of every secondary school, and the last of the three will thrive all the better if the two former receive their fitting meed of recognition. Technical instruction must be considered not as the rival of a liberal education, but as a specialization of it, which, whether it comes earlier or later in the scholar's life, ought to be as far as possible made a means of mental stimulus and cultivation, and will be most successfully used by those whose intellectual capacity has been already disciplined by the best methods of literary or scientific training.<sup>1</sup>

*Coeducation.*—The question of coeducation was very thoroughly examined by the commission, with the result that they advocate its further extension. Many difficulties of organization, they say,

may be obviated, especially where the number of pupils in a school or a department of a school is comparatively small, and some educational advantages secured by establishing schools in which boys and girls are educated together. This system has been tried with so much success in other countries, and to some extent in Great Britain itself, that we feel sure its use may be extended without fear of any undesirable consequences and probably with some special advantages for the formation of character and general stimulus to intellectual activity. Such a school may be organized either as a mixed school, the boys and girls being taught in the same classes throughout, or as a so-called "dual" school, having two distinct departments, but with a common staff and arrangements under which some subjects are taught to both sexes together.<sup>2</sup>

And again:

Some difficulty will no doubt arise in making adequate provision for the secondary instruction of girls in rural districts, owing to the fact that in many places the number of pupils to be looked for will not be sufficient to justify the creation of a separate girls' department either in an existing endowed school or in a secondary department to be attached to an elementary school. In these cases we think that the same school or department ought to receive both boys and girls, and the evidence we have received leads us to believe that this may safely and properly be done. We conceived that the duty and the interest of the community require equal provision to be made for both sexes, and although care may be needed in the conduct of the requisite arrangements, especially at starting, we are persuaded that the objections to a system of coeducation are slighter than those which would apply either to feeble separate departments or to a neglect of the needs of girls in cases where their number might be comparatively small.<sup>3</sup>

*Religious instruction.*—The absence of any recommendation touching religious instruction is particularly noticeable at this time, when excitement over the subject as related to elementary schools is intense. It is significant that according to the commissioners the religious difficulty

<sup>1</sup> Pages 284, 285.

<sup>2</sup> Vol. 1, p. 285.

<sup>3</sup> Page 297.

is "extremely rare" in English secondary education, and in avoiding the subject they are following the trend of educational legislation in England, which so far has been to "remove all just causes of offense or friction, and to secure as far as possible that differences of religious belief shall not unduly restrict the diffusion of educational benefits."<sup>1</sup>

Among the recommendations for improving the quality of secondary instruction not the least significant are the following relative to teachers' salaries:

In all public secondary schools we recommend the adoption of the provision usual in schemes under the endowed schools acts, that the salary of the head teacher shall be determined by scheme, and shall consist partly of a fixed yearly sum and partly of a capitation payment for each scholar in the school, variable by the governors within certain limits.

The method of fixing the salaries of assistant teachers should vary slightly according to the plan adopted for their appointment and dismissal, but the ultimate responsibility in the matter should rest with the governing body. Thus, where the appointment and dismissal are in the hands of the governors, the salaries should be determined by them, though here also they should be required to consult the head teacher. Where the head teacher has the right, however limited, to appoint and dismiss, the governors should fix the aggregate yearly amount or proportion of the income of the school to be applied in payment of the assistants' salaries, while the head teacher might, but always subject to the approval of the governors, determine the amount to be paid to each teacher.

With respect to women teachers the commissioners advocate a much more liberal policy than has hitherto prevailed. On this point they submit that—

Even when mistresses are as well qualified, academically and professionally, as masters, it nevertheless constantly happens that their standard of remuneration is fixed too low. This has a depressing effect on the educational profession as well as on the schools themselves, and although the matter is one for which positive recommendations can hardly be made, we may express the hope that the authorities of schools will deal more liberally than has hitherto been often the case with women teachers, and that, in fixing the scale of fees and the proportion of endowments to be attributed to their salaries, regard will be had to the desirability of encouraging, both by good salaries and by prospects of promotion, the entrance of the most capable women into the work of teaching.<sup>2</sup>

*Provision for classes not at present reached by secondary schools.*—Whatever advantage may result from the improvement of existing schools, it is evident that such measures alone will not suffice to extend the provision of secondary instruction to the classes now practically excluded from its benefits.

It was believed in many quarters that the time had come for advocating a system of free secondary schools, supported and controlled by the public. The experience of many school boards seems to prove the feasibility of such a measure. But the golden opportunity, if such it was, has been thrown away by the commission; so far from recommending a free system of public high schools, they distinctly advise against providing free secondary education to the whole community.

<sup>1</sup> Vol. 1, p. 75.

<sup>2</sup> Vol. 1, pp. 317, 318.

In place of a policy so democratic, they seek to devise means for enabling selected children of the poorer parents to climb the educational ladder.

*Scholarship funds.*—This is to be accomplished by means of scholarship funds. These, in the judgment of the commission—

should be of one or more of the following kinds, the kind to be determined, where the scholarships are founded by the local authority, at the discretion of that authority:

(1) Some should be open to children being educated in the ordinary “standards” of public elementary schools within the local area.

(2) Others should be awarded to children who are receiving their education at a so-called higher grade elementary school, or a secondary school (whether public or private) of a less advanced type than the school at which the scholarships are to be tenable.

(3) Others again might be open to all children attending any schools within the area of the local authority, or whose parents reside or are employed within the area.

(4) In some localities it may also be advisable to have scholarships open to all children free from any restrictions as to school or residence, but subject to suitable conditions as to age and the means of the parents.

It is especially recommended that—

provision should everywhere be made for both boys and girls, and where the same scholarships are open to both sexes care should be taken that a fair proportion, with regard both to the number of candidates and the comparative excellence of their work, is awarded to each sex.

As a rule the scholarships should be obtained by competitive examination. In case of scholarships attached to a public elementary school the commissioners advise that they—

be awarded either by competitive examinations held at the school, or, where this is considered undesirable on account of the tender age of the children or for other reasons, upon the joint recommendation of the head master and of the school board or school managers, to the scholars whose record of work is best for a series of school years or quarters, or by a combination of the two methods.

The commissioners add:

With respect to competitive examinations generally, we consider they should be restricted as far as possible to scholars above the age of 12, and that the examination, if at all applied below that age, should be of a very simple character. Even where the scholarship examination is held for children of a more advanced age, it should, we consider, be restricted to a limited number of subjects, should include a considerable amount of viva voce questioning, and should be directed principally to ascertaining the general intelligence of the candidates rather than the extent of their acquired knowledge. The importance, however, of insisting on these conditions, especially the two former, will tend to diminish as the ages of the candidates increase, and if any rules can be framed under which weight could be given to the health and physical condition of the candidates sufficient to avert the danger now sometimes felt of unduly pressing children forward and developing their brains at the expense of their bodies, the effect of such rules might be very salutary. We do not, however, think that this excellent object could be attained, as has sometimes been suggested, by allowing marks for proficiency in games, for that would induce another and not less mischievous kind of overpressure.

As to the value of scholarships, it is recommended that they—

be of several different kinds, viz: (a) Those which cover the cost only of instruction, with or without traveling expenses; (b) those which cover the necessary cost of board and lodging, as well as of instruction; and (c) those which consist of an annual payment of a fixed amount, either exclusive or inclusive of free boarding. Special judgment and caution will of course be required in awarding those of the two latter classes.

As the lack of secondary schools available for the poorer classes is one of the special evils which the commission was to remedy, it becomes necessary to limit the scholarships in some measure at least to those classes. This is to be done (1) by a provision augmenting the value of a scholarship according to the pecuniary circumstances of the holder, at the discretion of the local authority on the governing body of the school; (2) inquiry by the local authority into the circumstances of parents whose children are candidates for scholarships founded by local authority out of its own funds and intended for the children of poorer parents.

Different tests of pecuniary circumstances [say the commissioners] should be applied for different classes of scholarships. Thus, e. g., free education in a third grade secondary day school may be somewhat freely given to children of the wage-earning class, or to those belonging to families of equally restricted means; whereas a higher line, such perhaps as that now drawn for abatements of income tax at incomes of £500 a year, may fairly be drawn, if the local authority approve, in the case of candidates seeking aid from public sources to enable them to attend some place of higher education.

Fear that scholarships intended for the poor should be monopolized by the well-to-do is not groundless. This has been the fate of many such funds in the past, and the need of guarding against it is emphasized by the commissioners.

It has been brought to our notice [they say] that there are many scholarships of considerable value belonging to existing foundations, especially those of a nonlocal character, which are legally open to children of all classes. Some complaint has been made that the holders of these scholarships, having ceased to be deemed, as they once were, socially inferior to their schoolfellows, are now to a large extent drawn from the children of well-to-do parents, whose superior means have enabled them, by a special course of training at an expensive preparatory school, to secure the scholarship over the heads of their less fortunately situated competitors. We consider this practice, which tends to become more and more common, ought to be checked in the interests of public economy. But we do not think it would be either fair or wise to exclude altogether the children of well-to-do or even of wealthy parents from the laudable ambition of winning the distinction conferred by a scholarship, or from the right of sharing, together with other classes of the community, in the superior educational advantages often attaching to its possession. There are also, as we have pointed out elsewhere, grave objections to the present system on the ground of the unhealthy competition it induces and the disadvantages it imposes on the smaller and poorer schools. We therefore recommend that these scholarships should continue to be legally open to all classes, but should be restricted to a comparatively low value, the governing body of the school being intrusted with a discretion to augment their value in the case of any individual scholar if they should consider that such augmentation is required by the pecuniary circumstances of his

or her parents. We moreover consider that, in view of the difficulties in the way of individual schools carrying out such a reform by themselves, it should be required by a general statutory enactment.<sup>1</sup>

*Financial resources of secondary schools.*—The difficulties in the way of securing an adequate supply of secondary schools, and more particularly the uniform distribution of the provision, are brought to view in the attitude of the commission with respect to financial resources; virtually they leave this part of the problem where they found it, excepting so far as it is made to depend upon the will of the new local authority.

The extent [say the commissioners] to which public opinion will encourage the local authorities we have recommended to establish new schools or to develop those which exist, and the amount of popular support they will receive if they show themselves forward in this work, can not be conjectured beforehand, and will doubtless differ materially in different parts of the country. So will the scale of expenditure which those local authorities may be disposed to adopt. So will the readiness of parents to pay a fair price for the instruction provided, and thereby to increase that part of the school revenue which fees may be expected to supply. The possibility of turning endowments to better account, the prospect of making the various sums which are derived from the national exchequer go further than they do as now administered, the disposition of localities to rate themselves, are all of them matters more or less conjectural in any given district in the country, and still less capable of definite prediction as regards the whole country. We can not, therefore, undertake to establish an exact balance between probable income and probable expenditure. The most we can attempt is to present a view of the several funds now available, and to point out in what ways they may best be used so as to enable administration to be both economical and efficient.

The several sources of income which will be under the charge of the local authority have been indicated in the foregoing survey; to recapitulate here, they are: Endowments subject to endowed schools acts (£735,000 gross), additional available endowments (£100,000), grant under the customs and excise act of 1890 (£748,000 in 1893-94), rates (£640,000 possible outcome), tuition fees, Parliamentary grants. The last two are unknown and variable quantities in the problem. With respect to fees, the commissioners advise "that as a rule, assuming the school to have its buildings found, and the expense of their maintenance not to be included in 'cost price,' the cost price ought to be taken as the standard."<sup>2</sup>

*Number of secondary pupils.*—The want of statistics as to the actual number of secondary students in England is not supplied by this report. The number of secondary students, boys and girls, in the endowed and proprietary schools of seven selected counties is given as 32,092, or 3.6 per 1,000 inhabitants.<sup>3</sup> If this ratio prevailed over England and Wales, it would give a total of 108,200 secondary students in the classes of schools named. The ratio is greatly exceeded in

<sup>1</sup> For recommendations as to scholarships in full, see Vol. I, pp. 300-305.

<sup>2</sup> Vol. I, p. 312. For estimates, see Digests of Evidence, p. 605, present report.

<sup>3</sup> Vol. I, table, p. 424.

London, where the number of secondary students in public endowed and public proprietary schools is 26,179, or 6 to 1,000 inhabitants.<sup>1</sup>

Private schools, it will be observed, are omitted in this view. A recent estimate by the president of the Association of Private Schoolmasters gives 600,000 as the number of pupils under instruction in private schools.

The full bearing of the recommendations, here briefly summarized, which will certainly go far toward determining the future conduct of secondary education in England, can not be well understood apart from their historical antecedents. These are briefly outlined in the following extracts from the historical survey with which the commissioners preface their reports:

#### EXTRACTS FROM THE HISTORICAL SKETCH.

[Report of the Royal Commission, vol. 1, pp. 7-80.]

*Preceding commissions.*—It was not until 1861 that what is now called secondary or intermediate education engaged the serious attention of the Government. "In that year a royal commission was appointed to inquire into the condition of 9 among the chief endowed schools of the country, viz., Eton, Winchester, Westminster, Charterhouse, St. Paul's, Merchant Taylors, Harrow, Rugby, and Shrewsbury."

The report presented by this commission (1864) led to legislation "which introduced certain reforms in the administration of seven of the above schools which were nonlocal in their character, boarding for the most part as well as educating their pupils. The two excepted were day schools, drawing their scholars from London and its environs, viz., St. Paul's and Merchant Taylors. This first commission on secondary education was followed by a second, with a much wider and more national reference. This was the royal commission appointed 28th December, 1864, to inquire into all the schools which had not been included either in the commission of 1861 or in the popular education commission of 1858." \* \* \*

Its report, presented in 1867, and extending, with the appendices, to 20 volumes, throws a flood of light upon the whole subject, and it may be taken as a fitting point of departure from which to trace in outline the recent history of English secondary education.

#### RECOMMENDATIONS OF THE SCHOOLS INQUIRY COMMISSION.

The chief recommendations of the schools inquiry commissioners fell under three heads. The first of these heads compared the reforms which the commissioners deemed needful for the better management of the revenues of endowed schools and for securing the efficiency of their teaching. The second head related to the constitution of the administrative authorities, which were intended to carry out the reforms suggested and to bring both public opinion and professional experience to bear upon the development and working of a comprehensive educational system. Three such authorities were recommended—(1) a central authority, (2) a local or provincial authority, with a certain jurisdiction both in proposing schemes for the reform of endowed schools (the area being defined as a county or group of counties), and (3) a central council of education, charged with the duties of drawing up rules for the examination of schools and of appointing persons to conduct the examinations.

*Legislation growing out of the above recommendations.*—Fourteen months after the presentation of this epoch-making report, Your Majesty's then Government laid before Parliament a bill founded upon it, which, with some important changes, became law in the course of the session as "The endowed schools act, 1869." By this act a body

<sup>1</sup> Vol. IX, table, p. 437.

called the "Endowed schools commission" was established, with powers of making schemes for the better government and management of endowed schools (except the above-mentioned seven, which had been dealt with by the earlier act of 1868, and except a few other small classes of exempted schools). This commission was, by the endowed schools act of 1874, merged in the board of charity commissioners for England and Wales, while another act, passed in the preceding year (1873) modified in several points the provisions of the predecessor of 1869. Under these three statutes schemes have been framed and approved by Your Majesty for no less than 902 endowments in England (excluding Wales and Monmouthshire), leaving only 546 endowments, out of a total of 1,448 endowments in England, known to be subject to the endowed schools acts, which have not felt the reforming hand of the commissioners. By these schemes, which have been in a few cases replaced by amending schemes, great improvements have without doubt been effected both in the constitution of the governing bodies and in the educational work and character of the grammar schools. But a good many endowments, as having been founded less than fifty years before the passing of the act of 1869, have remained exempt from its useful provisions, while, as we shall have to point out presently, the powers of the commissioners have not always been found adequate to the needs of the case."<sup>1</sup>

#### AGENCIES FOR FOSTERING SECONDARY EDUCATION.

*Public agencies.*—The existing agencies for secondary education, as enumerated by the commissioners, are as follows: First. The school board, which have been active in creating "higher-grade elementary schools." These are really secondary in their character, "so far at least as regards their higher classes, in which instruction beyond the standards is given. They have, in fact, stepped into the educational void which the schools inquiry commissioners, noting it with regret, had proposed to fill by what they termed 'secondary schools of the third grade.'" \* \* \*

"Nor has the tendency thus to extend upward the range of primary instruction been confined to school boards. In some voluntary schools also ex-standard classes have been established, and upper departments of the higher-grade elementary type developed. The act of 1891, which replaced scholars' fees by a fee grant from the national exchequer, may possibly have increased the disposition to allow children to remain at school longer than formerly. But it has had another remarkable effect. It has rendered needless the old endowments, which, as attached to many elementary schools, were used to relieve the pupils from the payment of fees; and in making that which was a gift to places that did not possess such endowments—no gift at all to those places which did—it has raised the question of finding some purpose to which those endowments, no longer needed to replace fees, can in future be usefully applied."

The second agency has been that of the science and art department, whose grants began as far back as 1837. Although not originally made to schools or even for education, through the tendency of legislative and general changes in education they have become grants to scholars in schools, and thus virtually grants in aid of secondary instruction.

The third agency is that of "new institutions for higher education, particularly the new university colleges, whose growth has been so notable and interesting a feature of the last two decades. In 1863 only three of the eleven English colleges which in 1891 were deemed worthy of a share in the parliamentary grant of £15,000 had risen to the rank which all have now attained. \* \* \*

"Similar in character to these university colleges, which are open to both men and women, we have seen within the same period five new colleges established especially for women, viz: Girton (first at Hitchin and now near Cambridge), in 1869; Newnham (at Cambridge), in 1871; Somerville (at Oxford), in 1879; Lady Margaret Hall (at Oxford), in 1879, and Holloway (near Egham in Surrey), in 1886; while another women's college (Bedford College, London) has attained a rank equal to that of these five."

<sup>1</sup> Historical Sketch, pp. 8, 9.

The fourth of the new agencies is that of the county and county borough councils, which by the technical instruction law (1889) were empowered "to levy a rate not exceeding 1 d. in the pound for the support or aid of technical or manual instruction." Subsequently (1890) the surplus from the beer and spirit duties was turned over to the councils, with the privilege of applying the same to technical instruction.<sup>1</sup>

#### INTERMEDIATE EDUCATION (WALES) ACT.

In discussing these several agencies the commissioners call attention to recent legislation affecting secondary education in Wales. By the law passed in 1889 "the power of initiating schemes for educational endowments exercised by the charity commissioners under the endowed school acts was transferred for a limited period to an education committee of 5 persons, 3 appointed by the local council and 2 by the lord president, constituted for each county and county borough in Wales and Monmouthshire." \* \* \*

"Although this act has been only five years in operation, enough has already been achieved by it to show the importance of concentrating and correlating the various local forces and influences that can be used to promote education, and in particular to demonstrate the gain to be expected from the establishment of representative authorities charged with functions in that behalf."<sup>2</sup>

*Voluntary agencies.*—In addition to the agencies above considered and which have more or less of the official character, the commissioners note "the voluntary action, both individual and associated, of private persons, which has materially altered the aspect of the problem as it presented itself to the schools inquiry commission." "The first point," they say, "which here calls for notice is the change which has taken place in the status of the teaching profession. In 1868 it was almost entirely unorganized, its members isolated, and but little drawn together by the ties of common interest or common aim. There was comparatively little of that so-called "solidarity," or sense of responsibility, at once personal and collective, which is necessary to the discipline and high tone of a great profession. The state of things to-day shows a sensible improvement. Teaching is now an organized profession, and the tendency to consolidation is shown in the growth of several important bodies. The most dignified, although the smallest, of these is the Head Masters' Conference, established in 1870, which consists of the heads of the chief endowed public schools of the country, 89 in number." The most numerous is the National Union of Teachers (founded in 1870), counting at present about 28,000 members, nearly all engaged in elementary schools and not wholly unconcerned with secondary education." \* \* \*

"The Association of Head Mistresses dates from 1874, the University Association of Women Teachers and Private Schools' Association from 1883, the Association of Assistant Mistresses from 1884, the Teachers' Guild from 1885, the Incorporated Association of Head Masters from 1890, and the Association of Assistant Masters, the Association of Head Masters of Preparatory Schools, and the Association of Head Masters of Higher Grade Elementary and Organized Science Schools from 1892."

The College of Preceptors, which is more than an association of teachers, already existed in 1868. \* \* \*

Of private educational associations that are the direct outcome of the report of 1867 the most important are "The Girl's Public Day Schools Company, founded in 1872, which has already 36 schools, with 7,111 pupils; the Church Schools Company, founded in 1883, which has 27 schools and 2,166 pupils. Similar private action on a smaller scale has created not a few excellent proprietary schools in the large towns, especially in those where endowed schools either have been wanting or have fallen into torpor; while at the same time the level of private schools generally has risen, unequally, no doubt, and in some towns as well as in many rural districts scarcely at all, yet if we regard the country as a whole, to a substantial degree." Of the

<sup>1</sup> Historical Sketch, p. 13.

<sup>2</sup> Historical Sketch, pp. 9-13.

progress in the education of girls, which the commission of 1864 found in so deplorable a state, the present commissioners say:

"The improvement which we have noticed is perhaps most marked in girls' schools, proprietary and private, as well as endowed. School keeping is less frequently than it used to be the mere resort of ladies possessing no other means of support. The development of women's colleges, the opening, as yet only partial, of Oxford and Cambridge to women, the admission of women to classes of the new university colleges, has provided a far larger supply of competent women teachers. No change of recent years has been more conspicuous than this, nor any more beneficial. And in considering the causes which have produced this effect the opening of university degrees to women, in which the University of London was the pioneer, must not be ignored."

In this survey of movements which have taken place since the report of 1867 was issued, and which in some measure at least were promoted by that report, the commissioners dwell also upon the increase of popular interest in the cause of education. The schools inquiry commission held that without this interest "legislation could accomplish little; with it there might be many failures and mistakes, but the end would certainly be correction and improvement." Events have gone far to justify their forecast. The intervening period has been one of constant movement and experiment in both elementary and secondary education. Between these it has been found easier to draw a theoretical than to maintain a practical division, but wherever the dividing line may be drawn, instruction has been so enlarged on both sides of it that whole regions of knowledge at one time scarcely thought of as falling within an educational curriculum have been added to its province. The classical languages are taught more extensively than ever, but less as if they were dead, and more as if they still lived, rich in all those humanities by virtue of which they have been the supreme instruments of the higher culture. And they do not now stand alone; a place and a function have been found for modern languages and literatures, and it is ceasing to be a reproach that our schools have cultivated dead to the exclusion of living tongues. There has been a remarkable and growing use in education of certain physical sciences, while technical and manual instruction has risen and assumed, especially in certain localities, what may in some respects appear to be rather large proportions. And though some of these extensions represent new departments of knowledge, yet they involve instruction in old subjects, like mathematics and mechanics, and so build on them that the progress of the scholar depends on the knowledge he already possesses of them. "The idea of technical instruction as a means for the formation of citizens capable of producing or distributing wealth has taken hold, though in varying degrees of intelligence and intensity, of both our old borough councils and our new county councils, and hence has come a concern for that kind of education that we might otherwise have looked for in vain."<sup>1</sup>

#### THE STATE AS A FACTOR IN SECONDARY EDUCATION.

"Another point which emerges from the comparison of the state of things described by the schools inquiry commissioners with that which we see to-day is the swift growth in the educational functions of the State. \* \* \* This growth has not been either continuous or coherent, i. e., it does not represent a series of logical or even connected sequences. Each one of the agencies whose origin has been described was called into being not merely independently of the others, but with little or no regard to their existence. Each has remained in its working isolated and unconnected with the rest. \* \* \*

"This isolation and this independence, if they may seem to witness to the rich variety of our educational life and to the active spirit which pervades it, will, nevertheless, prepare the observer to expect the usual results of dispersed and unconnected forces, needless competition between the different agencies, and a frequent overlapping of effort, with much consequent waste of money, of time, and of labor."

<sup>1</sup> Historical Sketch, vol. 1, pp. 14-16.

<sup>2</sup> Historical Sketch, pp. 17, 18.

## SOME CONSIDERATIONS RELATING ESPECIALLY TO THE SECONDARY EDUCATION OF GIRLS.

"Since the schools inquiry commission made their report in 1868 there has probably been more change in the condition of the secondary education of girls than in any other department of education. The report of that commission, the action of the universities in regard to the higher education of women, and other causes have produced an effect which is gradually pervading all classes of the community, and through this or other causes the idea that a girl, like a boy, may be fitted by education to earn a livelihood or, at any rate, to be a more useful member of society, has become more widely diffused. The supply of good schools for girls is now far larger than it was twenty-five years ago.

"Private schools have very much improved, schools for girls under public management have sprung into existence, and many parents of the richer classes who would formerly have employed private governesses now send their daughters to day schools or boarding schools.

"The increase in the supply of good public secondary schools for girls has probably been both an effect and a cause of the great change in public opinion as regards their education. This increase is due partly to the action of the endowed schools commission and charity commission in restoring to the use of girls educational endowments originally intended for them and in directing the application to the education of girls of a share of those not specially appropriated to boys. It is perhaps to be regretted that more has not been done in this direction. This, however, is a defect for which the backward state of public opinion and not the charity commission is to blame. The commissioners of 1864 mention only 12 endowed schools for girls in England (exclusive of Monmouthshire). There are now some 80 girls' schools giving secondary education in accordance with schemes established under the endowed schools acts, and there are other endowments under those acts which are, or under certain circumstances may become, available for the secondary education of girls.

"Indeed, so far as modern beneficiaries are concerned the prospects of higher education for girls and women are exceptionally good. In their latest report the charity commissioners, after giving a list of gifts of £1,000 and upwards in the last twenty years, make the following remarkable comment: 'As to one particular branch of educational endowments, namely, that for the advancement of the secondary and superior education for girls and women, it may be anticipated that future generations will look back to the period immediately following upon the schools inquiry commission and the consequent passing of the endowed schools acts as marking an epoch in the creation and application of endowments for that branch of education similar to that which is marked for the education of boys and men by the Reformation.'

"Another fruitful source of increase in public secondary education for girls has been the establishment of proprietary schools on commercial principles—sometimes by purely local companies, sometimes by companies extending their operations over the whole country or large districts. The most important of the latter class are the Girls' Public Day School Company and the Church Schools Company, which between them own 60 schools. Proprietary schools have generally been established and managed by persons genuinely interested in education, and their success, at least in districts where the population suffices to maintain a large school, has been very remarkable. They have, moreover, led to the establishment in some places of good proprietary and private schools conducted on the same lines.

"The fees in the schools of which we have been speaking range generally from 9 to 15 guineas per annum, and the education is continued, when desired, up to the age of 19. Proprietary schools giving a less expensive education at a lower fee have been less successful, and there seems to be a good deal to be done in improving both the demand for and the supply of schools for girls leaving school at about 16 and unable to pay a high fee. But while this is a serious want, there is also a cer-

tain deficiency in the supply of the more expensive kind of high school, that, namely, which can give the very best teaching, and enough of it, in all subjects. A better staff is required for this purpose than can be paid out of an average expenditure of about £13 per pupil. There are very few girls' schools in which the cost is so high as £18 or £20 per head; but their popularity shows that there is a demand for them, even at self-supporting fees.

"So far as can be judged from places where the supply of public secondary education of the first and second grade taken together is equal in quantity and quality for boys and girls (e. g., Birmingham, Exeter, Thetford), the demand for the two sexes is about equal. As regards education ending at about 14 or 15, it is more difficult to judge. There is little public provision of education of this kind outside of higher grade elementary schools with ex-standard classes. In most places where such ex-standard classes exist they are less attended by girls than by boys; but whether this is because the girls are wanted at home, or because education is thought to be less remunerative for girls than for boys, or because the girls are educated elsewhere, or for all these reasons, it is difficult to say.

"The secondary education required for girls of the industrial classes will necessarily differ in some respects from that required of boys of the same classes. But it is undesirable that this difference should so be emphasized as to obscure the aim common to secondary education for boys and girls alike. There are, broadly speaking, two divergent views of this question. In one view practical utility is paramount. The girl is to be trained for domestic duties, as the boy is trained for some definite calling. In the other view, the first aim is a true education of the mind for girl and boy alike; and the special requirements of the industrial classes should, as far as possible, be subordinated to that aim. It is not incompatible with the recognition of this principle that the girl, like the boy, should receive some special instruction in the subjects demanded by her special circumstances.

"Of the grants made to secondary schools by local authorities under the technical instruction acts, by far the larger share goes to boys, though the value of the grant per head is in many instances the same for the girl as for the boy.

"With regard to the scholarships provided by the local authorities, girls are in some cases excluded; in others, they enter for an open competition with the boys; in others, again, the scholarships are definitely apportioned between the two sexes. Where this last rule obtains, it is common to find that three-fourths are reserved for the boys, and one-fourth for the girls; or two-thirds and one-third, respectively. Bristol gives 36 senior scholarships to boys and 15 to girls; while of the junior scholarships, 90 are for boys and 15 for girls. In London the intention of the technical education board was to allot scholarships in equal proportions to boys and girls. But as the number of boys competing was double that of girls, the board decided to grant two-thirds to boys and one-third to girls. There were, however, a few special scholarships for girls only. Experience will probably show what the best division between the two sexes is in each district, but there is no doubt that for girls, as for boys, scholarships are needed, both (1) to enable the cleverer girls (*a*) to enter secondary schools, (*b*) to prolong their stay in them, and (*c*) to proceed to the universities or other places of higher education; and (2) to serve as a stimulus to secondary education and help to keep up the standard.

"The need of more scholarships to the universities is much felt by girls, more especially by the proprietary schools. There is also a need of some scholarships sufficiently large in amount to cover, or nearly cover, the whole cost of a girl's university education. The St. Dunstan's scholarships are at present the only ones on this scale, and it is understood that even these are not to be continued. A few words may be added here on the question of mixed schools. Mixture is the rule in higher grade elementary and ex-standard schools, and mixed elementary schools are becoming more numerous in England. Such schools ordinarily have men at their head; and an apprehension has been expressed that the average quality of the elementary

schoolmistress may be impaired by the fact that the prospect of becoming a headmistress is, in this case, closed to her. On the other hand, there is at least one instance of a headmistress who has several assistant masters under her.

"In preparatory schools boys and girls are not generally taught together after the age of 8. Cases occur, however, in which they can be very successfully taught together up to 12 or even 13 to 14. There are also instances of mixed grammar schools. In such a school, described by one of our assistant commissioners, the ages of the children appeared to vary 'from 11 to 17; there were no small children.' Of the 40 pupils, 16 were girls. It would appear that, though the 'mixed' system will in England be usually confined to elementary education, there are cases in which its use for secondary education is practicable and has been successful. In small places a considerable gain, not only in economy but in educational efficiency may sometimes be secured by having one school rather than two."

#### WOMEN AS ADMINISTRATORS OF TRUSTS.

In this connection it is interesting to note that, as the education of women is improved, they are brought by a natural pressure into positions of public trust. The movement is illustrated by a "Memorandum on the relation of women in England to the administration of public charities," which may be referred to here as rounding out the information on this point supplied by the report of the Royal Commission. In the introduction the memorandum sets forth that—

"There is nothing in the general law of England to prevent a woman (as such), whether single, married, or widowed, from being a trustee either of a private or a public trust.

"There are, however, certain disadvantages in the trusteeship of a woman which have been greatly lessened, though not altogether removed, by the married women's property acts.

"These disadvantages, coupled with the habits and customs of this country with respect to the relations of women to matters of business have produced the result that women are seldom trustees of private trusts, and until recently were still less often trustees of public trusts.

"Even in the case of endowed charities for the benefit of girls or women, such as an endowed hospital or almshouse for women or an endowed charity school for girls, it was, until quite recently, most rare for a woman to become a trustee. Such charities have been numerous in England for some centuries, but until recent legislation minimized the disadvantages of female trusteeship they were properly considered to outweigh the advantages.

"For the secondary and superior education of girls and women there existed in England, until after the beginning of the latter part of the present century, scarcely any endowed charities,<sup>2</sup> and this fact had a double effect on the relation of women to the administration of public trusts in this country. First, on account of the non-existence of such charities as these there was no demand for female superintendence over a class of trusts in regard to which such superintendence is most valuable; and, secondly, for the same reason women of the middle and upper classes of society had not been to any great extent educated in such a manner as to render them competent in matters of business and administration."<sup>3</sup>

"During the last thirty years, however, a great change has been taking place in the relation of women to the administration of public charities in England, the cause of which may be traced, in part at least, to the following facts."

Here the memorandum reviews the work of the commission of 1864 so far as it relates to the education of girls and the practical efforts in this direction that resulted therefrom as already set forth in the report of the royal commission.

<sup>1</sup> Historical Sketch, vol. 1, pp. 75-80.

<sup>2</sup> Report of Schools Inquiry Commission, vol. 1, p. 565.

<sup>3</sup> See the interesting statement in the School Inquiry Report, Vol. VIII, p. 529, and a paper by Mrs. William Grey on the education of women; Ridgway: Piccadilly.

The memorandum then proceeds:

"The combined effect of all these events, whether legislative or social, has been to greatly modify the relation of women to the administration of educational charities in England and Wales. Although, as above stated, the Schools Inquiry Commission made no recommendation as to this matter in their report, the commissioners who had the charge of working the endowed schools act of 1869 saw clearly from the beginning of their work that it was necessary to provide for women having a large share in the administration of educational endowments; and in Paragraph XXI of their first report for the year 1871 to the committee of council on education they made the following observations on this matter:

"The last point we have to notice in the constitution of governing bodies is the introduction of women. On the one hand we think it hard to maintain, after much recent experience, that women are not in very many cases admirably qualified to take part in any educational work; in which cases not to use their assistance is a waste of resource where resources are scanty enough; but on the other hand we are not prepared to say that to require their introduction in every place would be found to work well. We have therefore, as to boys' schools, simply made women eligible on the governing body. But the case seems to us different as to girls' schools, and in those we have, by the schemes, required the presence of a certain number of women as governors."

"The policy described in these sentences has, with certain comparatively unimportant variations of detail according to circumstances of cases and the temper of the times, been that of their successors, the charity commissioners, in dealing with endowments under the endowed schools acts."

#### RÉSUMÉ OF EXPERT TESTIMONY AS TO THE PROPER ORGANIZATION AND ADMINISTRATION OF SECONDARY EDUCATION IN ENGLAND AS GIVEN BY SEVERAL WITNESSES BEFORE THE LATE ROYAL [ENGLISH] COMMISSION ON SECONDARY EDUCATION.<sup>1</sup>

The testimony given by some 84 witnesses before the late royal commission on secondary education covers 1,500 closely printed octavo pages, which carry more than 17,000 questions and answers. Much of this matter, though of the greatest importance to the commissioners, is not well adapted to being placed in a lucidly succinct manner before a public familiar with a very direct method of raising revenue for public schools of secondary grade and having the simplest way possible of allotting it. Two features, however, of the evidence obtained by the commission are of interest to a people who do not yet draw educational lines on social standing as far as the Caucasian race is concerned. One of these is the contention that schools which in the course of many years or even centuries have been endowed by private persons are endowed also with the purpose of educating the bright boys among the "industrial or lower middle classes," who are to be supported in these endowed schools by scholarships, while a class of schools called "higher grade" are particularly adapted to the average boy of the elementary schools.<sup>2</sup>

The other feature is the effort to prevent overlapping in these privately endowed but publicly used (for clever boys) schools with the

<sup>1</sup> Résumé prepared by Mr. Wellford Addis.

<sup>2</sup> Cf. testimony of the Bishop of London, a member of the secondary school commission, 1868; Dr. R. B. Poole, chairman of the Head Masters' Association, and Rev. E. F. M. MacCarthy, representing the school boards of England.

higher grade or secondary school for the average boy. To bring this about a sort of general arbitration board, called the central authority, was generally proposed to act as a buffer, as it were, between the large district or provincial or county authority (the board proposed being variously named), and the community, the private schools, and the boards of governors of the endowed schools. It would certainly seem, from the general drift of the evidence, that in England it is desired to segregate the clever boys of poor parents, whether these parents be industrial persons, small doctors, lawyers, poor clergymen, or clerks, into schools which have a certain, more easily understood than described tone about them, but at which the average boy shall not be instructed, at least at state (scholarship exhibition) expense. The object of this segregation, however, is to more highly educate at state expense those found worthy to profit by their advantages, yet too poor themselves to meet the expenses of an advanced course of instruction. To bring out these points the testimony of men of experience, and of large understanding of their speciality, has been introduced, as follows:

*Testimony of Sir George Young, member of the board of charities (to which was intrusted the control of endowed secondary schools by the Government of Mr. Disraeli).<sup>1</sup>*

Two objects, distinctly different in character, though concurring to the same end, are to be accomplished in organizing secondary education in England: The schools must be located (or, to use the witness's words, the ground must be covered) and the schools administered. They must be governed on a comprehensive scheme that has sufficient vitality to prevent anarchy, but also elastic enough to allow great swing to local aptitudes and wants. The great danger in the work of such a commission as that before which he was testifying is that it is disposed to create too much machinery, and the strong feeling among teachers and the public that the elementary educational department is too centralizing should also be carefully considered in framing a bill for the creation of a central authority for secondary education.

The two objects to be accomplished in introducing secondary schools should be effected through two bodies of persons, differing in the source from which they are selected. To one body, which is to be merely temporary, should be committed the location of the schools and their preliminary organization within an area to be determined not by existing county lines, but by expediency. To another subsequent and permanent body should be given a certain amount of definite control in specified matters, as inspection, examination of scholars, and school supplies, but not the control of the school in the ordinary sense of the word, which should be confided to a local board which would be in touch with the head master.

The first body, or board of location and preliminary organization, should be instituted to prevent premature stereotyping of the character of the board. It should be composed of from 11 to 25 members, women being included where of service, the majority of whom should be representatives of the county councils, and the others nominees of a responsible minister. Ministerial nominees are preferable to persons chosen by local educational bodies or professional associations, inasmuch as they will generally be of a higher character. Teachers (as such) on the preliminary board are undesirable, as they are swayed by particular interests. In brief, the qualifications required for an agency to cover the ground with schools should consist of those having experience of educational problems, of those having knowledge of and credit in the localities to be dealt with, those competent to deal with legal questions, and

---

<sup>1</sup> In 1874.

those willing to respect continuity of tradition in existing institutions and special care to respect the opinions of parents.

The constitution and methods of the permanent or general administrative body might be left to the temporary body. Indeed, by the introduction of more especial representatives of the university, and of persons learned in the affairs of secondary education, the preliminary body might pass into the permanent one. But there is difficulty in getting professional persons—the teacher in office is too busy; the retired teacher belongs to the past.

The area to be treated is of much importance. Considerations of centers of population, convenience of railway transit, and of sizableness must be had. It is advisable that educational provinces be created—for instance, that the small counties of Cumberland and Westmoreland and that portion of Lancashire called Barrow-in-Furness be made a province for educational purposes, and that where two large cities are located in one county, as Liverpool and Manchester, instead of making county borough educational districts of them they might be erected each into an educational province, with the intervening territory divided between them. In short, county bounds should be ignored and utility govern the limits of the educational province.

The central agency has been in Wales, the board of charity commissioners. The joint county educational committees referred all proposals of schemes to the charity board, who modified and returned them, and if an agreement could not be had the matter was referred to the minister. The successful operation of this method was due to the presence of an agent of the charity board at the meetings of the joint county board when the proposals of a scheme were adopted. It would be indispensable to have a large corps of such agents if establishing the Welsh system of secondary education in England, especially since Wales was not covered with endowments, as was the case in England, being, as it were, a *tabula rasa* in that respect. The witness would insist that he was incompetent to give any decided opinion upon the question of making England a *tabula rasa* in the same respect as Wales, as would have to be the case if elementary education were made directly auxiliary to secondary education by the reconstruction of English educational ideas, and would suggest that the powers of the educational department were not so favorably regarded as those exercised by the board of charity commissioners "where the value of decentralization was understood." The central power in secondary affairs should therefore be distinct from any central educational power now existing in England, though under the same minister (the vice-president of the committee of council of education), and the eyes of such a central body would be the agents referred to above. Between the central authority and the local boards for each school would be the provincial board and possibly, for financial purposes, the county board. But to more distinctly characterize the educational province, each one of them if not too small might be looked forward to as becoming the possessor of a university of its own; and to unmistakably characterize the provincial board it should be instituted to prevent the whole power of control being centered at London.

The local board should be composed of elected representatives, an education element including elementary teachers or representatives of the elementary school board, and two or three members known to be well able to give assistance, but who would not likely to go through the annoyances of a popular election.

The provincial board being a break in the direct operation of the central authority, though subordinate to it, that authority must depend upon the returns made by the localities, the reports of examiners and of its own agents, for dereliction on the part of the management of the schools.

The course of secondary education is modified in England by three factors—the necessity of accommodating its character to the length of time to be devoted to it, individual parental feeling, and the scholarships offered by Cambridge and Oxford to those 18 or 19 years of age. In conformity with the report of the schools inquiry commission, the secondary schools were divided into three grades, in each of which the

pupil was expected to pay a fee, the third grade was intended for those leaving before attaining their fifteenth year, the second for those leaving from 15 to 17, and the first for those remaining until their eighteenth or nineteenth year. Only one of these has had a quiet existence. The elementary school, by increasing its curriculum above the three R's and the correlative studies, and by offering free tuition, squeezed out the third-grade secondary school against the second grade, and the second grade, in which Greek was prohibited, was objected to by parents, who, though in an abstract sense objecting to the strictly classical system of the old grammar schools, are desirous, as parents, of giving their children that kind of education even yet. Indeed, at Bradford and Wakefield the endowed schools commissioners were so hotly opposed in their attempt to make the school there into a second grade, that they were compelled to yield. The tendency to keep boys at a secondary school has passed beyond reason, considering how desirable it is that they should enter upon the freer life of a university; and to drive up the age, as Oxford and Cambridge have done, is to increase the expense, and it is probable that the richer universities of England will become the universities of the rich, and the poorer universities the universities of the poor. It is said that in Scotland a very large proportion of the best students enter the university at 15 or 16. This would create a social distinction, which would antagonize the work of the secondary, in mingling the rich and poor, as the objection made by some parents to having their children mingle with those of people whom they consider to be in a lower social grade than themselves has considerably diminished, though more slowly in schools for girls than in those for boys. Now and then the secondary school authorities are met with a social-status difficulty when for the first time they introduce boys by merit from the class that attend public elementary schools into a secondary school, but experience has in almost every instance led the local people to see that their fears were unfounded, and the anticipations of the endowed schools commissioners that there would be no practical obstacle to the admission of promising boys from elementary schools to so-called second-grade schools.

Were the universities to lower the age from 19 to 17, it might be necessary to alter the regulations governing admission to the army; but it is not at all certain that the candidates for the army desire a realschule education, just at this time at least, as such candidates come from the upper classes, which have by no means ceased to desire a classical education for their sons; for from recollections of his own experience in examining for army entrance the witness was strongly inclined to say that the education encouraged by those examinations was intended to be that generally given in the great public schools. When pupils are going to leave at different ages—say one part at 16 years of age and another at 18—it is preferable to have them in different schools if the funds permitted. Departments limited by age, or by fee, or by curriculum, have broken down in every school where they have been tried. Modern sides parallel with classical sides have been more successful, but are clearly less efficient than separate schools, because the head master can not be equally interested in the performance of both sides. A third and least desirable form is the second-grade secondary school with a first-grade top. It is very desirable to have a limitation of age after which boys should not be allowed to stay in a school, for if boys are allowed to stay after the age specified there will be an upper class of boys which will have the principal attention of the master and give a cast to the whole curriculum in a direction in which it should not be influenced—that is to say, on the old classical lines. Governing bodies are ambitious, and would like to see their school a first-grade secondary school. No one can object to seeing a first-grade secondary school in the hands of a first-rate classical scholar, but it is objectionable to see second-rate classical scholars getting the best second-grade secondary schools and the poorer secondary schools being mastered by those who can only be described as third-rate scholars, all of which is a very great discouragement to those who desire to make themselves proficient in modern subjects.

It is impossible to logically arrange the distribution or grading of schools in the rural districts. There one must permit a single school to do two kinds of work.

In regard to the spirit in which these schools are to be conducted the whole limitation of the local grants, under the customs and excise act, to technical education, or rather to anything which is not literary, will have to be removed. To retain it would distort the balance of the curriculum. The appropriation of the fund should be made to the literary or the technical side at discretion of the county councils.

*Testimony of Dr. R. B. Poole, head master of the Bedford Modern School, representing the Head Masters' Association.*

The Head Masters' Association has a membership of 270, and is open to all head masters that have no pecuniary interest in the company which manages the school finances. There is also the Head Masters' Conference, composed of those who prepare principally for the universities. Together these associations have 370 members, a little more than one-half of the head masters in England and Wales. The Head Masters' Association considered that there should be a central educational board, which should consist of various nominees by the Crown, the universities, and other bodies, such, for example, as their own. This board should be presided over by a minister of education, and through him be represented in and be responsible to Parliament.

The powers of the central board should be large; it should be the ruling and regulating power over all secondary education, whether supported in part by the State or municipalities, by endowment, or wholly by fees. It should be a court of appeal in regard to the placement of new schools, the amalgamation of others when they are too numerous or are ineffective, and should have the direction and inspection of all the secondary schools of the country; but those regulations should be carried out by an intermediary body called the provincial council, which would be supposed to exert great influence in the formation of the regulations in the way of adapting them to local needs.

The provincial body might have for its jurisdiction either the area of a county or of a group of counties, the aim being to have a jurisdiction containing from one to two millions of people, though no subdivision of counties, even if urban, should be made. The powers of the provincial council should be locally executive, to levy rates, to invite proposals for supplies, to suggest the scheme of instruction adapted to its particular province, to carry out the general orders of the central board, and to report to that board the places where necessity dictated that new schools should be established and the ways and means thereto.

The nonlocal, national, or so-called public schools (the 9 so called and about as many more not so styled) should not be placed under the authority of the provincial body, though they should be connected with the system of secondary education through scholarships from second-grade schools (for boys ending their schooling at 17) to them. All private schools should be registered, and one of the prerequisites of ability to register should be that each school must submit itself to the inspection of the provincial council.

Each school should have its own governing body, except in large towns, where a number of such bodies may be amalgamated perhaps with advantage. It is most desirable that members of governing bodies should be locally interested in the schools which they govern. Upon this governing body the head master should have a consultative seat, but no vote. He should have the power of appointing and dismissing his assistants with an appeal to the governing body; indeed, such an appeal being open, it would be easier practically for a head master to discharge an assistant than if the matter rested wholly in himself.

The class of persons who require to have a new or improved system of secondary education given to them are what may be called the lower middle classes. There are

a large number of artisans who would be able to pay £6 annually for several of the children in attendance at secondary schools. A considerable number of children whose parents were too poor to pay the £6 would be able to obtain it through scholarships from the elementary schools. To furnish these scholarships, the county boards would have to be called upon to eke out the endowments given to many elementary schools for the purpose. In regard to witness's own school at Bedford, which enrolled 600, 100 boys came from the country, attracted by the low rate of tuition fees (£4). Some of these came 20 miles, but it is found, in general, that the distance they have to come detracts a great deal from their mental faculty.

The salaries of assistant masters is entirely inadequate. In a great many schools there are masters who are not receiving more than £100 or £120 annually, and there are a considerable number of younger people who are receiving still less. The witness knew of cases where £60 or £70 were received. In all these cases board and lodging are excluded. In the Bedford School, one of the most richly endowed in England, one-half of the assistant head masters are university men, and a number of them over 35 years of age.

*Testimony of Rev. E. F. M. MacCarthy, M. A., vice-chairman of the Birmingham school board and head master of King Edward's Grammar School, Fiveways, Birmingham, representing the Association of School Boards of England and Wales.*

The witness made a fundamental distinction between secondary schools supported by endowment and those supported by the county council. The curriculum of an endowed secondary school (of second grade) is based on the understanding that the pupil enters the school at an early age (say under 11 years of age) and remains there for five or six years. Now a pupil who has completed the sixth standard of the elementary education code in a public elementary school is 12 or 13 years of age. Such a pupil using the endowed secondary school as a continuation school enters the latter with a mental equipment much narrower in range than the pupils of corresponding age among whom he finds himself. He suffers many disadvantages on this account. A pupil, however, who leaves the public elementary school earlier (say after passing Standard IV or V) suffers fewer disadvantages, though naturally a clever pupil of any given age suffers less from the dislocation than an average pupil of the same age.

A protest should be entered against the widely prevailing theory that only clever pupils from public elementary schools are to be expected to desire to continue their education in an endowed secondary school. Endowed secondary schools should be open to all classes of pupils, whether they are clever or not. Any parent of a child of even average ability is justified in desiring a continuation school above the elementary school for his child, and thus, when he has completed the course of the elementary school, to pass him on to an endowed secondary school for his further education, provided the parent is pecuniarily able to do so. The usefulness of the endowed secondary school, as contradistinguished from the secondary school supported by the county (that is, as far as Birmingham is concerned), is limited by the fact that only those pupils who have left the elementary schools at 10 or 11 (Standard IV or V) achieve as a rule any measure of success. Many even of these having received a narrow range of training, and being only of average ability, had much better have remained and completed their course at the public elementary school, and then they would have found a natural continuation school in the county board school, but pupils of 12 or 13 who have gone right through the ordinary public elementary school course (passed Standard VI), or pupils of 14 or 15 who have spent some time beyond Standard VI in a higher grade elementary or board secondary school (like the holders of county council technical scholarships or exhibitions) are certainly not fitting subjects to be dealt with by an endowed secondary school. All these come too late and leave too soon to derive much benefit. The point, therefore, is that the board secondary school is the natural continuation school to a public elementary school, and should therefore be further developed and better adapted to

meet those new wants, to obtain which these older children now seek an endowed secondary school, but which an endowed secondary school does not and can not supply.

As to whether it is desirable to carry on technical education (in its earlier stages) as a department of a secondary school proper or relegate it to an institution wholly devoted to such instruction, the former alternative is the better, for the following reasons: The teaching staff being available for both "sides," the teaching of mathematics and science on the nontechnical side would be carried on more efficiently than if the technical side were a distinct school. The same would be true of the teaching of literary subjects and mathematics on the technical side. Again, in any arrangement involving distinct schools there would be a tendency to the establishment of social distinctions between the schools, for the danger of a separate lower-grade technical school is this: It is said that it is a school for the sons of artisans, and the other is the school for the sons of gentry or the middle classes. If the schools are under the same head but are divided into two departments, then there would be no chance of social distinctions as between those who are on the technical side and those who are on the other.

The present school boards are the only power to which the whole department of education should be intrusted, because they are the only people that can do the work. All matters pertaining to elementary and secondary education should be intrusted to an ideal school board such as does not exist in England. A good school board for secondary education alone would be one elected by the ratepayers, with the powers of an existing school board for elementary schools.

It is found that the technical education given in the board secondary schools is not filling the minds of any of the children with a desire for the kind of life for which they have not the ability adequate for success (see Note A), but the endowed secondary school (King Edward's school) is drawing a large class of boys into secondary schools, where they pick up ideas about their future career which are clerkly in character and which they had much better not entertain as far as their own prospects are concerned.

There should be no fees for [secondary] education anywhere.

*Testimony of John Bidgood, esq., B. Sc., head master of the Gateshead Higher Grade School and the secretary of the Association of Head Masters of Higher Grade Schools representing his Association.*

The first aim of the higher grade school is to carry on education beyond that which is called elementary. Most schools in England carry on the children to, say, the sixth standard—seldom higher—and a higher grade school is to carry them further forward (from the fourth standard); in some cases this carrying forward may be only for a year or two, and in others to four or five years. The second aim of the higher grade school is to make this education as well fitted for the purposes of such children as they possibly can. In some schools the pupils are taught partly under the code of the education. The witness would prefer that pupils should come to his school at standards IV and V, in which case the beginnings of higher education can be laid down and carried on into the sixth and seventh standards, with the notion of a continuance of three or four years beyond that stage. But in many towns education in the higher grade schools is free, and therefore the school boards have confined all the elementary education to the ordinary elementary schools up to and including the sixth standard, and after that the children are sent to these schools, which become higher schools than the sixth standard. In other places the board have made the arrangement of admitting only pupils of the sixth and seventh standards. The larger number of schools are not free; only schools lately established have free tuition, a condition exacted by the education department. But in all fee-charging schools there are donational scholarships, so that practically there is no child in England who wants a higher education but can get it free (deposed by D. Forsyth, M. A., D. Sc.), and in the Leeds Higher Grade School (witness's own) there

are 200 such scholarships. Besides, all school boards have the power of remitting fees. The fees for tuition are only one source of revenue, another are the grants from the science and art department, and a third source are the grants from county councils from local taxation.

As the higher grade schools are schools for the people, our association feels that they should be under a board elected by the people for educational purposes. It is the pride of our schools that they are in touch with the people and with their needs. The endowed (or "grammar schools")<sup>1</sup> draw exclusively from the upper classes.

*Testimony of Charles Henry Wyatt, esq., clerk of the Manchester school board and representative of the Association of School Boards (England and Wales), of which he is honorary secretary.*

There should be one local educational authority in each area which should be called the board of education, and should have the control of elementary, secondary, and technical education, but not of the university if one, within that area. The adoption of such a proposal would abolish the whole of the rural school boards, and in towns the existing school boards would be given the power to add representatives dealing with secondary education. To these boards of education should be given also the charge of the provision of additional secondary education. There should be such a board of education for each county borough (urban district), and for the "administrative" (i. e. nonurban) parts of counties. This board should be elected by the ratepayers, and might vary in the number of its members according to population or other local circumstances. The board should have power to appoint special committees in each district or group of districts, whose province should be to deal separately with matters affecting secondary, technical, and primary education; and upon the committees dealing with secondary and technical education it should be competent for the district board to appoint representatives from the governing bodies of university colleges, existing secondary schools under the charity commissioners (wherever rate aid may be given), the teaching profession, or any other persons whose influence and assistance would be of value. All these boards should be under a strict central authority, which would not centralize too much, as the control of the education department is a wholesome control. One of the greatest advantages arising from this proposed arrangement would be the abolition of rural school boards, which are on all hands considered objectionable. In short, there would be three great authorities, the school board, the central authority, and the minister; the central authority having the power now possessed by six different bodies, to wit: The education department, the science and art department, the local government board, the home office, the public works loan commissioners, and the charity commissioners. The evils of the present system of having several powers dealing with the same thing can be well illustrated by the divergent action of the science and art department and the education department. The latter has abolished payment by results; the former has really accentuated the evils of that system by holding examinations more adapted to statistical purposes than to the needs of the students. The minister would be responsible to Parliament, and as such would take the whole management of the work.

A necessary connecting link between the elementary schools and the secondary schools proper is the so-called higher grade school. Such schools, properly organized, would crown the elementary system. It is thought that for boys and girls whose education will cease at the age of 16, the secondary education which may be imparted by these schools is of the kind best suited to their wants. These schools, properly organized, would be the direct feeders of the technical schools and of the

<sup>1</sup>It is scarcely necessary to say that the English terms "public schools" and "grammar schools" do not connote what is understood when those terms are used in this country. The English "public schools" are 9 very expensive institutions (Eton, Rugby, etc.), and in general the English "grammar schools" are classical high schools,

secondary schools of the second and third grades. But the present prominence which is given to science teaching and the absolute neglect of many branches of general education seriously interfere with the practical value of the higher grade schools as these are now established in Manchester, where there are 6, with accommodation for 7,104 children. For instance, it is found that a boy leaving one of those higher grade schools will, in the subjects in which he has been taught, be on a level with any boy in such schools as the Manchester Grammar School (classical secondary), but in Latin and Greek he will be nowhere. The higher grade schools should be organized to obviate this defect, but an organization of that kind must be freed from the operation of the present rules affecting organized science schools, which are almost invariably associated with schools of this type. The seating capacity of higher grade schools in England and Wales is now 40,898, and there are 6,629 children in them in classes beyond the standards. But it should be borne in mind that a great deal of secondary work is done within the standards. This class of schools affords opportunity for the most talented and intelligent of the elementary school-teachers, while they also provide an admirable training ground for young people desirous of becoming teachers. It is well to have a preparatory department to such schools; such a department gives a backbone to the school which is otherwise wanting where the whole body of its pupils are transferred from elementary schools. The idea of the organization contemplated in the foregoing testimony (reading from the bottom up and supposing no absolutely necessary connection (?) between the columns) may be expressed graphically thus—

|   |  |   |  |
|---|--|---|--|
|   |  |   | Highest division. Pupils preparing for the universities or professions, etc. |
|   |  | Upper division. Pupils who have passed the standards. | Middle division.   |
| VII.<br>VI.<br>V.<br>IV.<br>III.<br>II.<br>I. | Standards and infants.                                       | Preparatory.  | Preparatory division.  |
| Primary school.                               | Higher grade school<br>(secondary school<br>of third grade). |   | Secondary school of<br>second grade.   |

By this arrangement the secondary schools of the second grade, which deal largely with classical education and are the immediate avenues to the universities, would

each have as a base a preparatory school for those who, owing to class distinctions of various kinds, will never be found in great numbers in the public elementary schools. In the preparatory department of the higher grade school languages and literature might be taught at suitable ages, in order to facilitate the passing of pupils into the secondary schools of the second grade, and from the higher grade school might also pass those who desire a technical education in the institutions provided for the purpose. But technical schools have not been set forth in the diagram, because they are special places of tuition, just as are schools of music and of the fine arts—all necessary in their way for those whose needs they supply, but not an essential part of the supply of general education for the bulk of the boys and girls who have gone through the elements of instruction in a public elementary school, in the preparatory department of a higher grade school, or in the lower division of a school of the "grammar (classical) school" type. The effect of science and art grants upon higher grade schools is not satisfactory, as they exert too great influence upon the course of instruction given in the school, and much of the science teaching can only be fragmentary and of little practical value. The fifteen hours a week which have now to be devoted to the work of the science and art department in organized science schools renders the teaching of literary subjects an impossibility. The scheme thus laid before the commission has for its major the intention of the parent with regard to the child's future career. A fee should be charged in the higher grade school, though not sufficiently large to make the school self-supporting. Evening continuation schools should be deemed agencies for secondary education.

*Testimony of C. Bowdon, esq., head master of the Wesleyan Schools, Gateshead, formerly president of the National Union of Teachers, and representing that body before the commission.*

The members of the association, numbering 26,000 teachers, feel great interest in secondary education, and desire to see the methods of passage from one class of schools to another improved and made more easy both for scholars and teachers, considering that primary education would be greatly advanced by being brought into organic relation with secondary education. They wish that one educational authority should control the education of the country, central and local; and they consider this essential in order to secure efficiency in schools, because the secondary schools at present are under no proper control or really effective supervision. They say that if there were two authorities to control education, one primary and one secondary, there would be undue competition between the two authorities, as there is at present between those administering the money that is generally called the whisky money<sup>1</sup> and the school boards. The county councils are doing work that the school boards are doing, though the boards, being the first in the field, think that they have a right to do the work. They think that if there were one authority, instead of competition, there would be coordination, and that the one authority would be able to establish various classes of schools instead of there being rivalry between those two authorities in establishing the same class of schools. They also say that at present there is no convenient passage from school to school; that those who know the children in the elementary schools know which of them would be benefited by secondary education; that if there were an authority for secondary education only, that authority would have no knowledge of the wants and desires of the parents of the children in the elementary schools and could not provide adequately for those desires. They say that it is much better that things should grow naturally rather than that they should start from two different points; that if there were a local authority to control secondary education it would really deal more with a class of people than with the whole of a people, and that it would really be class education rather than secondary education. They say that a great deal of energy would be wasted, as well as public and private money, and that there would be a great deal of

<sup>1</sup>So called as the money for technical education is derived from the excise on spiritous liquors.

overlapping. If there were two bodies for the purpose of controlling education, there would be two sets of officials, for example, where one would suffice, and there would be two applications to the rating authority where one would suffice.

If there were one authority (local) for a large district, it would induce a number of educated persons to become members of that authority. Representing various interests, these people would see that there were various types of schools. No one who desires the good of the country would wish to have our schools made of one uniform character, and it seems that if there were a large body, authority being exercised over a great district, there would be much more chance for a diversity of schools than there would be if there were two authorities. As was said before, if there were an authority for secondary education only, that power would deal with it more for class education than for the education of the whole of the people in the country. The best area for a district is the administrative county [rural districts]. The commission of 1868 suggested more than one county, but the population has grown very largely since then. But even the districts for electing members of Parliament might be taken, as the people are accustomed to vote together; this would give about 50,000 souls to the district, but county boroughs (large cities) should not be dislocated.

The present school boards in towns should be elected by the rate payers, and should be enlarged by the admission of persons elected by teachers. To such a board of education should be committed all the primary and secondary education of the town. The schools should be free.

The secondary schools at present do not supply the wants of the vast majority of the people. They are too few in many places, and are unsuitable in character; that is to say, they are mainly classical schools. We have only, at the outside, 3,000 persons going to the universities; there are about 1,000 freshmen at Oxford and 1,000 at Cambridge every year. The majority of the people want their children not so much to go to the universities as to get that education which will enable them to take their places in the industrial occupations of the country, and it is evident that the so-called higher-grade schools are serving that purpose admirably. The great improvement in those schools to be effected is the lessening of the excessive science instruction.

*Testimony of the Right Reverend the Lord Bishop of London (a member of the Schools Inquiry Commission, 1864-1868.)*

The Schools Inquiry Commission looked upon secondary education in its report entirely as education to be paid for by the parents, and it is therefore necessary to look carefully around as to the proper manner of adjusting a system of free secondary education founded on that report with one for which the parents are to pay. It should be considered that parents will send their children to the better secondary schools in spite of the fact that such attendance costs money, and also that the social status feeling operates to the same end. It is impossible to have a regular continuation between the different classes of schools from the elementary to the lower grade of the secondary and from that to the higher grade of the secondary; but though each school must stand apart, it is nevertheless possible to form a ladder with picked boys. You can carry boys from a lower grade school to a higher if they have been carefully picked, whereas you could not carry average boys at all. With the average boy the lower grade must distinctly prepare for the higher and be practically a preparatory school for the higher, or else when the boy gets into the higher he is altogether thrown out. But with the picked boy, if you do not exceed a reasonable number, it requires really very little special adaptation to bring the boys into proper relations with the whole school system and course of instruction in the higher position. The mistake which is frequently made is that people suppose there is a very large number of boys who may be rightly picked out from the lower schools and put into the higher, whereas the number of boys who could be so picked out is really very small. It is doubtful whether it is wise to provide for the average boy a means of progressing

from the elementary school to schools of a higher kind. The thing to be feared is that the elementary school will step into the place of schools which prepare boys for commercial pursuits, clerkships in offices, and so on, which is a place they can not readily fill. It is better that those boys should be in really secondary schools, and secondary education should not be free, for though the plea of poverty comes in at all turns, it is difficult to see why the parent is to expect that his child should be educated beyond his own means of providing education any more than that his child should be fed or clothed beyond his own means of providing food or clothing. It is not a social feeling, but really a preference for a certain characteristic of the education given, that induces a preference of parents for a certain school. There can be no doubt that a school in which you have a large preponderance of boys of a very low social grade is not in that sense a very good place of education for boys of a much higher grade. On the other hand, if you have the preponderance the other way, the boys of the lower social grade are really the better for being in constant companionship with boys of a higher social grade. It is necessary to keep in view the cultivation of manners as a part of the education of the children, and not only the manners, but of what belongs to the moral principle of cultivated people. The average boy will hardly pass through the elementary schools until he is 14. The child must not be pushed, for it is important to note that a whole nation must go on very slowly in that matter, and you will find after your elementary education has been going on for a certain length of time you can teach higher subjects to boys of the same age than you could have done at the beginning, because their homes are already beginning to be affected. Those who have been in the schools have become the parents, so now a good deal of the teaching of what are called class subjects is very much better than it was. In the past the pressure to have such subjects taught was mischievous, and in the future it will be better than it is now.

It might be taken for granted that, secondary education being self-supporting, the impecunious classes would have to be content with elementary education, unless for the purpose of culling out the cleverer boys for the service of the State that portion of the impecunious community should be given scholarships which would enable them to enter upon secondary education. It is not in point to say that such conditions will incorporate, so to speak, class distinctions; the thing can not be helped. You have an enormous number that are excluded from the university. The State is not prepared to take upon itself all grades of education up to the top. As to the assistance of clever boys, the scholarships should be of small value and open to rich and poor, but in the case of the successful poor competitor the authorities should have the power of augmenting them to the extent demanded by the pecuniary income of the parent, but it is not probable that anything you could devise will enable children from the elementary school to compete for scholarships at Eton, for example.

Secondary education should not be managed on the same centralized system as primary education; there should be between him and the immediate governing body another.

*Testimony of Rev. T. W. Sharpe, senior chief inspector of schools.*

Secondary as well as elementary education should be free. The imputation that universally free secondary education will unduly increase the number of persons who are indisposed to manual labor is unjustified as the matter corrects itself. At one time in the elementary schools of England there were a great number of children who were endeavoring to become clerks, but there has been a distinct reaction in favor of the artisan class of late, since the wages of artisans have risen. The same thing would probably happen in a higher class of education. School boards are not a proper authority to govern secondary education, which should be committed to a county or provincial council. It is desirable from a theoretical standpoint that elementary and secondary education should be under the same authority,

but persons experienced in education, teachers of all classes, should be placed upon the county or provincial council. In regard to the attendance of children residing in the rural districts their traveling expenses should be paid to and from the secondary school they were compelled to attend.

In his evidence regarding free education the witness had had before him the pecuniary difficulties of clerks, poor clergymen, and poor doctors.

*Testimony of Sir John F. D. Donnelly, secretary of the science and art department.*

The science and art department in general deals with industrial classes; that is to say, with those whose parents receive for labor or as income in any form fewer than \$2,000 (£400). Secondary education is rather undefinable. Elementary education is intended for those who leave to engage in business at 12 or 13, secondary for those who leave at 16 or 17, and higher for the university student. Now, the elementary education of a boy who is going to leave school at 12 or 13 should not allow him to take up subjects which he can not carry to some definite conclusion by remaining until 16 or 17, nor those contemplating leaving at 16 or 17 should not have elements introduced that require a university career to carry out.

The work of the science and art department is an interpolation into the ordinary system of a literary school or a standing invitation to the foundation of a new school whereby in chemistry, for instance, £2 is given for every pass in the higher grade of elementary schools, £1 for every pass in the lower grade in secondary schools, and £1 for every pass in the higher grade of secondary schools [the sum annually so distributed amounts to £750,000]. Formerly the lower grade of science instruction in elementary schools was given £1 for every pass, but the county educational authorities have relieved the science and art department of encouraging such elementary instruction by giving a capitation on attendance. The schools that have taken up the organized science school curriculum are not, as a rule, the ordinary secondary or endowed schools, as they can not well give the time to that curriculum, and therefore are compelled to take one or two subjects only. It therefore follows that the organized science schools are elementary schools, and, in general, the department fosters secondary education in a narrow sense of the term, as distinguished from the general sense, for the organized science school is for the student who is going to work principally, if not entirely, in a scientific direction. The grants to organized science schools should be larger and with such grants should be conjoined the requirement that literary instruction should be given to a larger extent than at present in those organized science schools.

*Testimony of Sir Bernhard Samuelson, Bart., M. P., chairman of the late technical education commission and of the technical committee of the Oxfordshire County council.*

Witness would not aid technical secondary education unless some general education were present, as technical education can not be effectively given unless it is combined with general education; not only that, indeed, but for higher technical education good general education is absolutely necessary, for, as the technical education committee reported, "The best preparation for technical study is a good modern secondary school." Under the term "technical education" he would include everything which prepares a man or woman for the walk in life which he or she intends to pursue. Such instruction should be given in technical departments or classes attached to secondary schools, that is, as far as young people are concerned. There is very little reliance to be placed on technical education in the primary [elementary?] school unless it be merely some object lessons and drawing. If there were capacity for it, the technical education should commence at a very early age in secondary schools, or rather in preparatory departments of secondary schools.

It would be inadvisable to take the control of technical education from the provincial or county body having control of secondary education, and also undesirable

to have any central educational authority other than the minister of education, all the proposed functions of such a body being mainly retained by the county council and the rest of the responsibility fixed upon a single man, the minister of education, to whom should be intrusted the registration of private schools.

*Testimony of Mr. John Montgomery, assistant master in Parmiter's School, Victoria Park, and honorary secretary of Association of Assistant Masters, which body he represents.*

The associations of 460 members from all classes of secondary schools, endowed or unendowed, public or private. As to the qualifications considered necessary for a head mastership his association held that a degree is necessary in every public secondary school, as at present required by about one-third of the schemes of the charity commission, while in a majority of other cases it is required that he shall have either the degree or such other qualification as the governors may approve of. Of 596 schools for boys of which they had information, 503 have head masters who are graduates, to wit: From Oxford 156, Cambridge 196, Dublin 44, London 109, other universities in United Kingdom 12, foreign universities 1; total, 518; counting none twice, 503. Of the 596 head masters 283 are in holy orders. The association also held that the candidates for head masterships should be required to have five years' experience as assistant masters in a public secondary school.

The assistant masters demand that there should be a right of appeal in every case to the governing body of the school.

His association would also suggest that the charity commission require that the governing body of every school should once a year send in a financial return, which is not always done. By the courtesy of the charity commissioners the association has been noting down and investigating the various items in the financial returns, and in some cases, in order to get the financial return of a school, they have had to go back to the year 1886, though they have not gone back any further. The blank form issued by the charity commission is not, in their opinion, the best form, but in that form it is required that there shall be shown the yearly rate of payment to each teacher, but in nearly half the cases this is not done. In some returns the salaries of the assistant masters appear under the head of "assistant masters, apparatus," etc. Then the number of boys is not given in about half the cases, although required, and on the whole the returns are not well made. But from such information as they have been able to obtain they find that in well endowed public secondary schools that the average pay of the assistant master is about £150. They consider that assistant masters in public secondary schools are poorly paid, and that in founding secondary schools some provisions should be made for the salary of such masters. The schemes state as a rule that the governors shall fix a sum for assistant masters and apparatus, but in no scheme is there any provision as to what proportion of the endowment or how much per head should be assigned as the salary of assistant masters. Many cases occur where the staff of five or six or even more assistant masters receive no more than the head master. Such provision should be based on the minimum cost of efficient education per head and the assignment of a certain proportion of that minimum to salaries for assistant masters, taking into account the amount of available income and the number of boys.

All vacancies should invariably be advertised in the newspapers and be announced by no other means.

The following is an analysis of the approved schemes of the charity commission for the administration of secondary schools for boys:

|  |     |
|--|-----|
| Number of schemes .....                        | 409 |
| Appointment of head master:                    |     |
| Degree essential .....                         | 183 |
| Membership in Church of England essential..... | 31  |
| Appointment of assistant masters:              |     |
| In the hands of governors.....                 | 50  |

## Appointment of assistant masters—Continued.

|  |     |
|--|-----|
| In the hands of head master, subject to the approval of governors.....                             | 4   |
| In the hands of the head master.....   | 355 |
| Dismissal of assistant masters:  |     |
| By the governors .....   | 50  |
| By the head masters, with appeal to governors.....   | 42  |
| By the head masters, with appeal if expense has been incurred in setting up a boarding house ..... | 4   |
| By the head master, subject to approval of governors.....  | 4   |
| By head master .....   | 309 |
| Fixing of compensation of assistant masters:   |     |
| By the governors.....  | 51  |
| Assignment of a sum by head master, subject to approval of governors.....                          | 339 |
| Assignment of a sum by head master .....   | 14  |

[In the course of the examination of the witness his associate, Mr. Martin, interjected the following: "I should like to bring this fact before the commission that, under the present conditions, when a head master resigns his post or is dismissed he has to give notice to every assistant master on the staff, for the reason that the assistant masters are his servants and not the servants of the governors; so that when you dismiss the head master you dismiss every man in the school. I think that is a point on which assistant masters feel rather keenly." Of course this is in many cases a mere form, but it is practically applied in the case of a new head master having a system rather different from that of the retiring master.]

## NOTE A.

[Handed in by the Rev. E. F. M. MacCarthy, M. A. (See Q. 6395).]

*Analysis of occupation of parents of Past Bridge Street boys, year ending November, 1893.*

## CHAPTER XIV.

### PAPERS ACCOMPANYING THE REPORT OF THE ROYAL COMMISSION ON SECONDARY EDUCATION.

#### REPORT ON CERTAIN FEATURES OF SECONDARY EDUCATION IN THE UNITED STATES OF AMERICA AND IN CANADA.

MY LORDS, LADIES, AND GENTLEMEN: I received instructions on the 27th of August last to proceed to the United States and make inquiries upon topics embraced within the province of the royal commission on secondary education.

In the first instance I received a paper entitled "Heads of information which it is desired to obtain from the United States of America," with a similar paper relating to Canada, and I was instructed to obtain a more complete answer to these inquiries than had already been obtained by correspondence. I came up to the office of the commission in London and examined the answers to this paper of questions which have already been received from some twelve prominent teachers and professors in the United States and from Principal Grant, of Kingston, in Canada.

I was also fortunate enough to secure an interview with the chairman of the commission, who gave me verbal instructions which enlarged the scope of my task. While giving due attention to the points raised in the "Heads of information," I am to keep in view the whole ground of inquiry which is undertaken by the commission, and, in order to enable me to judge of the questions at issue, I was supplied with various printed papers, by the perusal of which I may follow the lines of inquiry which the commission is pursuing. The chairman also pointed out that it would be necessary for me to conduct my work very rapidly, and to present my report early in the winter, and, since it may be difficult to complete a satisfactory statement within such a short time, the chairman suggested that I should forward letters or portions of report on any topic which seemed to me to be of importance; and, as I have spent a considerable time in the study of education in Germany, it was pointed out that I might profitably incorporate any experience I had thereby gained in questions where the comparison of German methods might be helpful.

Further, I was instructed to examine two reports which have, in previous years, been published under Government authority; the voluminous account of the common school system of the United States and Canada, presented by the Rev. James Fraser (afterwards bishop of Manchester) to the royal commission (1867),<sup>1</sup> and a brief account of American schools by Mr. Fitch, Her Majesty's senior inspector of schools, printed by the education department in 1889.

Under the present circumstances, it has seemed to me that it would be of little service if I were to attempt to prepare a sketch of the organization of secondary education in America or to describe any institution and methods in detail; indeed, the short time at my disposal makes such a task impossible. I have followed an

<sup>1</sup>Question 8, in the "Heads of information," is, I understand, intended to suggest a comparison between the conclusions reached in this report and the course of events in education during the interval. I found, however, that the written replies sent from America in answer to this question were not very helpful.

entirely different plan. Taking in order the topics embraced by the royal commission as sketched in the "Memorandum by the chairman, an outline of the order in which topics may usefully be dealt with in the report," I have gathered together the evidence which American experience seems able to supply, keeping in view the situation of affairs as we find them at this moment in England. I have given a number of references to documents which have been offered to me on every hand in my journey, and which a longer time would have enabled me to make more use of. The greater part of my time has been spent in interviews with teachers, to whom I was introduced by letters from members of the commission before leaving England, and by their aid I was enabled to meet with others whose experience and judgment are appreciated in their own neighborhood. I may add that my inquiries have not been confined to teachers and professors; I have found it very profitable to meet State officials, superintendents and secretaries of boards of education, as well as lay members of such boards, and my impressions have been assisted by conversation with men and women who have no direct concern with the management of education, with merchants, with ministers of religion, and with parents of children attending schools. Here and there I have also had the advantage of meeting English scholars now settled in American colleges or universities, and I have found not a few American teachers who have familiarized themselves with our English methods and who are able to offer valuable points of comparison between the plan of organization pursued in the various countries of Europe.

I ought to add that I have everywhere met with a most cordial welcome, and the greatest pains have been taken to put me in possession of every kind of information that I sought, and I have therefore been able to prosecute my inquiries more rapidly than would otherwise have been possible in the few weeks at my disposal.<sup>1</sup> On my arrival in the country on September 23, I first visited Washington and Baltimore, and spent several days with Commissioner W. T. Harris and his assistants in the Bureau of Education (see p. 636); since then I have visited, in order, Philadelphia, New York, Boston, and Toronto, spending a week or more in these cities or in their neighborhood.

It is, perhaps, necessary to emphasize the point of view from which the pages that follow are written. If they give the impression of a disparagement of our English education at the expense of what I have seen in America, this impression will be due to the aim which has been set before me. I have not attempted a critical estimate of American education; I have sought to *exhibit some of its merits* so far as these have a bearing upon the admitted deficiencies of secondary education in my own country.

2. I propose, firstly, to indicate from the experience of America the kinds of secondary schools which appear to be needed in a complete public plan of education; secondly, to discuss the nature of the authorities, local and central, who should administer these schools, and therewith the distribution of their functions in relation to endowed and private schools as well as public schools; on which will follow the discussion of one or two special questions which seem to need more detailed treatment, such as the financial maintenance of schools, the entrance, and the leaving certificate. A separate section has been devoted to the training of secondary teachers. Within this scheme I shall be able to refer to the nine questions in the "Heads of information," and to include the ground covered by the "Memorandum," so far as the experience of Canada and the United States seems to be of service.

<sup>1</sup>It would be ungracious of me not to mention the following, to whom I have been very specially indebted: The Hon. W. T. Harris, United States Commissioner of Education; Prof. Edmund J. James and Dr. Devine, of the American Society for University Extension, Philadelphia; Prof. Frank Morley, of Haverford College; Prof. N. M. Butler, president of the Teachers' Training College, New York City; Principal Ray Greene Huling, of Cambridge, Mass.; Professor Buell, of the Boston University; Dr. Melvil Dewey, secretary to the regents of the University of the State of New York, Albany; the Hon. G. W. Ross, minister of education, Ontario, Canada; and President Harper and Prof. Richard G. Moulton, of the University of Chicago.

## SECTION I.

3. Before entering upon these subjects, I desire to offer some general observations with reference to the principles which are at stake in the establishment of a system of secondary education. The contrast between ourselves in England as a people and the English race in America across the ocean lies mainly here, that in the most progressive States of America *the people believe in education*, and are willing to make sacrifices for the sake of their creed. I do not think that anyone who has gone about among American schools and seen the mode in which they are supported and continually extended could doubt that this faith in education is genuine and is distinctly characteristic of the most progressive parts of the country.

If it were not outside the purpose of this report it would be easy to trace the origin and the growth of this idea from New England, where it had its birth, to the West, which has been created largely by emigrants from New England, and, since the war, to the Middle and Southern States, where the same faith is being slowly acquired. Now this belief in education has had two effects. Firstly, in the refusal to limit public schooling to the rudiments of instruction; the high school equality with the primary school has been recognized as a part of the public plan of education. I have taken considerable pains to inquire whether the press or the people show any signs of objecting to the heavy school taxes which are required to support high schools; and, except in a few instances, I have always received the same answer—the common people believe in free high school education; every parent hopes that his own child may be clever enough to be advanced to the high school, and perhaps afterwards to college, and the idea that secondary education is only for the well-to-do gains no foothold. Everywhere in the United States where I have traveled the school tax is the most popular of all the local taxes, and in the Northwest its range is extended even beyond the high school to the support of State universities.<sup>1</sup>

Secondly, outside of the scheme of public education, we have presented in the United States an almost prodigal liberality in the establishment and support of private educational enterprises. On every hand colleges and universities and technical institutes are bountifully supplied with the gifts of rich men, and it is evident that this stream of wealth is the result of a national sentiment in favor of education. We have no parallel to this generosity either in England or in any other country.<sup>2</sup>

In a later paragraph I shall recur to the question of private endowment.

I desire to emphasize the importance of this abstract idea of faith in education, for it appears to me to indicate the only right basis for a public system of higher education. Our present system in England has been hitherto based upon another principle. We have seen that a minimum of elementary instruction, for children who can not obtain it otherwise, is necessary to national safety and progress, and must be imposed by authority and paid for by the public, as we pay for police and sanitation. Such a system needs to be either wholly administered or, at any rate, strongly controlled by a central authority, and such a system may properly be limited to the few branches of instruction which will achieve the aim desired. But it is wholly different with a nation that has learned, or is beginning to learn, its own need; the people of such a nation are competent, each in their own locality, to discover and supply their necessities, and they will refuse to limit their needs by any elementary code; they will vote for and will maintain many forms of secondary education for

<sup>1</sup>In the West, however, the tax is comparatively light, because a large sum is appropriated to education from the proceeds of public lands.

<sup>2</sup>At Harvard £70,000 per annum is regularly expected as a fresh endowment, and all the successful colleges of the Eastern States look to similar bequests in order to keep pace with the continually growing demands of educational development.

the public benefit, and they will adapt these institutions to their local needs far better than any central authority can do it for them.

Now, it is quite another question whether this belief in education is justified by its results, whether, that is to say, the money and time devoted to the higher instruction of a large number of young men and women is really well spent, and the problem presented is the one proposed in question 6 of the heads of information. "It has been said that the secondary schools of the United States turn out a large number of scholars whose circumstances would lead them to earn their living by manual labor, and particularly by agricultural labor, but who are unwilling or unfitted to do so, and have little prospect of finding congenial employment. How far, if at all, is this statement true?"

Now, the idea that young people can be overeducated seems to be wholly alien to the American way of thinking, and unquestionably the evils which are supposed to result from overeducation in Europe are not found in this country, for the social and economic conditions of American life are wholly different from those of Europe; and again, since education in America is a product of "the people," it has been rapidly adapted to the people's needs.

By economic conditions, I mean that immigrants do a large portion of the manual labor, and that the labor which is *not* performed by hired help is not regarded as beneath the dignity of a man or woman who has received a higher education.<sup>1</sup> With us in Europe, to be highly educated means to be brought into a higher social atmosphere, into a class which is dependent for manual aids upon lower classes. In America, the tendency in this direction is of course observable, but not to anything like the extent as among ourselves, and thus the highly educated man or woman is not necessarily drawn into another social sphere, but is regarded as being better fitted for those pursuits in life to which he feels naturally attracted. If the American boy does not take kindly to day labor in the fields, it is because there are plenty of other people brought into the country to do that work, and he prefers to gain an education which will give him "directive power"<sup>2</sup> in a more intelligent walk of life. If, after his education, he returns to agriculture, he will not work on his farm as a day laborer, but he will direct machinery or direct the work of others.

The above is an argument which applies to a new country more than to an old country, but the second argument will apply equally to any country. The American tells us that we can not give our children too much education, but we can give them useless education; and America illustrates more than any European country the need for continually *adapting our curriculum*<sup>3</sup> to the necessities of the times. No country, for example, has developed more rapidly or more successfully the method of manual training,<sup>4</sup> first by means of the kindergarten in the primary school and then by manual training departments in the secondary school, and by every kind of scientific and technical department in the university. This movement is now in course of development, and has proceeded with the greatest rapidity during the last five years. Professor Hinsdale, of Michigan, in replying to the commission on this question, looks to the cure of the evil, not by closing the high school doors to the laborer's child, but by preaching everywhere the real nature of education, and by convincing parents

<sup>1</sup> Numbers of students in American universities pay the whole or part of their expenses by labor, such as typewriting, printing, taking care of lawns, etc. See Catalogue of the University of Minnesota, p. 55. This is the case not only in the West, but at Harvard and Yale.

<sup>2</sup> This is a phrase given me by the Commissioner of Education, Dr. W. T. Harris, who looks to the development of this "directive power" as one of the main purposes of higher education.

<sup>3</sup> In European countries it is still held by most teachers that there is, or ought to be, a fixed formal plan of studies which should achieve the ideal of secondary instruction for every child, regardless of his future calling in life, or even of his tastes. In America this mode of thinking is not often found. (Vide Report of the Committee of Ten, p. 53, Bureau of Education, Washington, 1893.)

<sup>4</sup> For the latest information on manual training we have a voluminous report by a commission appointed by the Massachusetts State board of education. I have given their recommendations in an appendix.

and the public of the benefits which good practical education will bring with it, not only for success in business, but for the higher pursuits of life.<sup>1</sup>

There is another country exhibiting the same firm belief in education which we find in some of the States. I refer to Germany; and in Germany I venture to believe that the charge of overeducation is justified. I think there can be no question that there are too many men in Germany who have received an education which opens the doors to a few select pursuits and which closes the doors to many other pursuits. There are far more teachers and doctors and lawyers in Germany than the country can find work for.<sup>2</sup> I venture to think that this condition of things can only be prevented by placing the control of higher education more and more in the hands of local authorities and by relying upon the people themselves; unless this is done educational ideals will be set before the schools which have no correspondence to the necessities of life. The American secondary education no doubt fails to create as many scholars as we find in Germany, but it does start an interest in culture; it trains boys and girls to self-support and activity, it brings them into contact with social and civic life, and it leaves them with a freedom of motion which enables them to find a sphere and occupation in life where the young man or woman trained in the German school is comparatively helpless.

Hence the conclusion is reached that, while elementary education may properly be imposed upon a nation, public education of the higher type ought only to be organized in response to the people's demand, and hence it ought to be mainly under popular local control.

4. The whole problem of education is one which is only to-day beginning to be the subject of scientific treatment, and hence we can not hope for finality in schemes for the readjustment of national education. While we find in other professions a fair consensus of opinion on means and methods, in education no such agreement can be found. Every conceivable variety of practice is employed in different parts of the world, and even in different parts of the same country. Now, the present century has witnessed in every part of Europe the establishment of school systems, more or less complete, creating permanent means of operation by which the child is to be prepared for life. These schemes vary very much in the extent to which they control the individual school or teacher, but they all tend in the same direction, *to fix the forms of a school by the machinery of law or code*. Such a mode of procedure was inevitable at the outset both in countries governed by a strong central authority and in countries like England, where the desire for local independence was strong, but where the national sentiment in favor of education was weak. But in America we have a striking contrast; in place of the codes and systems of Europe every locality is master of its own educational machinery, and hence it is possible for new methods and ideas to have some chance of being tested by experiment. Up to the present time it is probable that the results of American education, conducted on the popular plan and with little oversight from higher authorities, are poor compared with the results obtained under a good European system; but it is a different question whether

<sup>1</sup> As an evidence that America was not educating too many high school boys, Dr. Harris showed me the results of an inquiry made by him when superintendent of St. Louis, to discover the positions in life held by the "graduates" from these schools. To these boys education had simply meant so much increased capital to invest at high profit in a business or professional career. The problem is one which is capable of scientific statistical treatment; an attempt at such treatment has been made by the director of physical training in Boston (Report to school committee; school document No. 8, 1894), based upon Dr. Farrar's Vital Statistics (London, 1885).

<sup>2</sup> In Ontario I found that the same complaint was being made. The rural high schools are said to have given to farmers' children an education "above their station," and they have deserted the country to come and live in the towns. So long as a stream of immigration supplied their places with new agricultural laborers the harm did not appear; but there is little immigration now and trade is bad. The remedy for this is surely not to close the rural high schools, but along with the general education to teach practical arts and branches of instruction connected with farm life having a close relation to the future calling of country boys and girls.

the *ultimate* result may not be better. It is, at any rate, very clear that if our present imperfect knowledge of education be once admitted the United States has a better opportunity of discovering and developing new pedagogic knowledge owing to the very want of system which characterizes its education.<sup>1</sup> The problem seems to be to organize a scheme which shall hinder inefficiency and waste without hindering the development of educational ideas.

In the first half of this century Germany was the great field for the production of educational ideas—Pestalozzi, Froebel, Herbart, and a host of others were free not only to meditate upon theory, but to test their ideas by the practice of the school. Since the strict establishment of the German school systems, these men have had few successors; and the best fruit of their labor is being inherited, not by Germany, but by England and by America. The kindergarten, for example, was banished from Prussia because the Prussian authorities did not approve of it, and it is only in these last two or three years that it has found recognition with the English education department; but in America it was easy for a single progressive town or city to make experiments with the method, and still easier for the success of such an experiment to lead to its adoption elsewhere.<sup>2</sup> I am convinced that there is in the minds of American teachers a desire to learn about education, a humility with reference to their present knowledge of the subject, which contrasts favorably with the attitude of the successful teacher in European countries. No doubt this humility goes along with a considerable amount of boastfulness about the results already achieved, and a conceit which is often not justified by the results; but this tendency to self-laudation does not hinder the eager desire to learn from every quarter.

5. These two observations lead to a third, to which I have already referred: That education in all branches, elementary and higher, ought, so far as is consistent with its aims, to be directed by local authority, to rely upon local support, and to appeal to a central higher authority only within very guarded limits. Fortunately, in England we have experience which justifies us in enunciating this principle. I take it that one reason why local authorities were given such large powers in the administration of the technical instruction act was because it had been found that our school boards had administered efficiently the more limited powers given them by the act of 1870; and in America I have found no one who desired to see "the people" deprived of the great authority which they possess over the administration of education, although the weakness of the United States system, which lies in the lack of a State central authority, is usually admitted at the same time. I propose in later paragraphs to deal with the problem here presented in detail. Here I wish merely to emphasize the principle to which, as I know, most English teachers are opposed, that secondary education needs popular control and popular support, if it is to achieve its aim.

Those who distrust local boards of education for fear of their ignorance of the subject, forget the rapidity with which knowledge on public questions is now communicated from place to place, and the ease with which those who desire can inform

<sup>1</sup>"Our system has a tremendous and overflowing vitality, which promises more for the future than the well-fitted machinery of England. Did you ever live in a country town during the week of a teachers' institute? It is a greater attraction than the new railroad or the circus. The air is saturated with educational questions. The teachers, often of the same social grade as the best of the residents, are received into the homes and made the central features of the excitement. Better still, have you ever been to a State or national education convention? The discussions do not strike one as being in the least shallow or vaguely general. \* \* \* Thus our country is permeated with educational life. England does not know much of it. Her teachers do not read professional literature, as ours do. They do not communicate popular enthusiasm for education as ours do, although they are often more highly trained."—President Sharpless, of Haverford College, on the Relation of the State to Education in England and America (No. 87, in publications of the American Academy of Political and Social Science).

<sup>2</sup>See "Annual Report of Bureau of Education, 1891-92," for records of the increase of public kindergartens in American cities. It should be noted that, as a rule, the kindergarten teachers are trained especially for kindergarten work; it is not thought sufficient simply to give primary teachers a superficial acquaintance with Froebelian methods.

themselves as to the best available methods. The United States exhibits, even better than our technical instruction committees, the possibilities in the way of training local authorities to understand educational problems.

6. No forms of education can be permanently established on a self-supporting basis. This principle, which is admitted in the case of elementary and of university education, has been denied in England in relation to secondary education, and it is true that in some cases in England successful proprietary schools have been established which pay their way, and which even return a dividend to those who have subscribed the funds, but I believe it could be proved, by careful inquiry into the history of English proprietary schools, that the proprietary system is one which can not be regarded as a permanent type, even if it were desirable that it should be so. In America, as in Germany, no one dreams of establishing a plan of secondary instruction on a scale of fees which will cover the expenditure; either the public purse must meet the financial need, or men of wealth supply the place of State aid. There are, of course, both in America and Germany a number of private<sup>1</sup> schools which are self-supporting, and such schools have a most important function in a scheme of national education; neither in Germany nor in America do we find prudent educators who despise the work of the private school, or wish to see this form of education disappear. But their existence does not supersede the public duty toward secondary instruction and the necessity for the establishment, in every part of the State, of public institutions which will supply the national need. These institutions, however wealthy many of the parents may be whose children attend them, can not be maintained by school fees alone. They have not been so maintained in earlier days when the cost of education was confined to the provision of buildings, teachers, and text-books; still less can they be so maintained in these days when the constantly expanding demands of education call for costly apparatus, of which earlier generations had no conception.

7. Finally, America is perhaps the only country in which the following principle is clearly illustrated—the principle of the *unity of all forms of education*. By this phrase I mean the doctrine that all institutions for educational work, from the kindergarten to the university, are part of the same system and need to be treated on the same general principles. Those who are engaged in this work are regarded in America as one body of teachers, whether men or women, whether professors in the university or teachers in the village school. The distinctions that have been made between the various types of education—represented by the term elementary, grammar, high school, and the like—are distinctions which only have a right foundation so far as they discriminate the various stages in the one educational process from childhood to manhood; so far as they have separated teachers into classes, they are the result of earlier imperfect conceptions of education which have an historical basis, but no basis in sound thinking. There is little in the nature of things to justify the barriers erected by school laws and by custom between one section of teachers and another, and I saw much in close intercourse with German teachers to make me regret that German governments maintain these barriers so firmly. I call particular attention to this doctrine because it has been reinforced by the movements which are now taking place in American education. Only the other day the most distinguished representative of the American educational world, President Charles Eliot, of the Harvard University, has taken occasion to enunciate this principle,<sup>2</sup> in order, as he says, to enable his university to do its work more efficiently, from the conviction that all sections of education need to be coordinated. The method by which he and others in America are seeking to secure this mutual

<sup>1</sup> I wish to use the term "private" in the English sense, to indicate what, in America, are known as private adventure schools, that is to say, schools which are the private property of the principal. In America, however, the term "private" is used to indicate every kind of school which is not administered under the laws of the State.

<sup>2</sup> The Educational Review, New York, September, 1894.

understanding and cooperation is, not by setting on foot a detailed scheme of administration for the whole State controlled by a government department, but by seizing hold of those points of contact where primary, secondary, and higher education meet one another, and by inducing teachers in each of these sections to join hands to the achievement of their common objects. The same spirit is shown in the National Educational Association, which is probably the most influential society of teachers in the world, comprising all ranks of teachers, from the university downward. Its most recent task has been to set the various committees to work which have dealt with high-school curricula, resulting in the now famous Report of the Committee of Ten. On similar lines the Ontario Educational Association has been organized, with departments for kindergarten, primary, high-school teachers, inspectors, and trustees. They hold some sessions of their convention together and some in departments. (See Report of Minister of Education for 1892-93, pp. 110-115.) When this spirit of cooperation has once been established, it may be possible to develop a State system of administration which will provide a suitable basis for every type of school without hampering the needful independence of the teacher and of the local authority.

At present the United States seems to be the only country in which the lines of demarcation between elementary, secondary, and higher education are kept in due subordination. In Germany the separation between elementary and secondary instruction is absolute, and in all countries which have received their educational impulses from Germany we find a similar distinction. I venture to believe that the United States have not lost by following the other principle. In England our secondary instruction, owing to its lack of organization, is in danger of losing its own standing ground. On the one hand, the elementary school system has encroached upon its borders by means of higher grade schools; on the other hand, the older universities control it at every point by means of written examinations. Our secondary schools need to work out their own destiny, untrammelled on both sides, while cooperating closely with primary teachers and with university teachers.

#### SECTION II.—*The kinds of schools required and the work done by each.*

8. In my inquiries in America to determine the limits of secondary education, I found that there was no universal agreement on the subject; for the public system places under local control three types of schools—the primary, the grammar, and the high school, and the commencement of secondary instruction lies somewhere in the grammar school. The primary school gives a five years' course of instruction up to the age of 9 or 10; the grammar a four years' course up to 13 or 14, which is succeeded by a high-school course up to 17 or 18; and in some cases the same local authority will add a college course or a normal school course, carrying on the education up to 20 years of age; and at no period is any strict boundary line drawn prescribing that secondary instruction shall begin at such an age or end at another. Since, for various causes, instruction in American schools has proceeded at a slower pace than in European schools, a child who has completed the grammar school course at 14 has usually not advanced further than the European child who has completed the elementary course at 12; but, in order to reform this state of things, it is proposed not to commence the high school at an earlier age, but to introduce what are called secondary school subjects into the grammar school course.<sup>1</sup> Nor, as we have seen, is the distinction between elementary and secondary instruction maintained by a separate classification of teachers such as prevails in European countries. A large number of teachers in American high schools are women who have had a normal school training, and who have afterwards taught in primary or grammar schools, before taking a class in the high school. A school board, managing a number of

<sup>1</sup> Can School Programmes be Shortened and Enriched? by Eliot, Macalister, W. T. Harris, and others (pp. 101-115, in Report of Proceedings of the Department of Superintendence of the National Educational Association, Washington, Government Printing Office, 1888).

city schools, may appoint either primary teachers or teachers who have been educated at college; a most important work in secondary schools is done by "college men," but there is no law which creates a distinction between one class of teacher and another. Hence the term "secondary" has only a vague signification in America; it is used in the Bureau of Education<sup>1</sup> to cover all schools above the grammar school, and Dr. Harris has made a distinction between primary and secondary education for the purpose of his reports, similar to the distinction which prevails in European countries. He holds that primary instruction should be regarded as ending with a knowledge of the language, history, and geography of the home country, of arithmetic, and the first beginnings of natural science, and he terminates this period of study with the American grammar school; but, as we have seen, it is one of the objects of reformers at the present moment to "enrich the grammar school course" by introducing higher subjects, such as foreign languages, algebra, physics, and the like before the child enters the high school.

I have inserted the accompanying plan in order to illustrate the differences between several countries in determining the limits of secondary instruction. The United States and Ontario make the three grades of education consecutive. In Germany and in France elementary and secondary teaching overlap for some five or six years; in England the two courses run on different lines from the beginning.<sup>2</sup> I attach importance to the question of the inferior limit of secondary education, because it involves a determination of the financial support which should be given to secondary schools. If we presume that many secondary schools now existing may be supported in the future, or new schools may be aided, on a method similar to that of the technical instruction act, by grants of public money, the question will be raised, whether, in apportioning such grants, allowance should be made for children under the limit of age at which it is decided to distinguish secondary education from primary education. On the American plan our legislation would classify the kindergarten and the preparatory departments of our present grammar and high schools as a section of primary instruction, and would presume such children to be in primary schools up to the age of 14. On the other hand, the German and French system, while permitting the child intended for a secondary school to commence in the primary school, takes him away from the latter after two or three years, in order to prepare him separately for a special course in after years, and in England the secondary school does its work entirely apart from the primary school.

The American plan is democratic, for it delays as long as possible the division between the child intended for the university and the child intended for the workshop; the German plan tends to narrow and specialize its education at too early an age. My own opinion is that it would be better for all our English children to be educated together in the primary school until the age of 11 or 12, no secondary instruction being recognized by law before that age. The English practice of absolute separation has surely been injurious both to primary and secondary instruction; the education of young boys and girls in our endowed and private schools is the least satisfactory portion in the whole field of secondary education. In this, as in many other problems of politico-social investigation, we are able to learn from our Greater Britain the trend of popular impulse among ourselves, and to forecast the conditions which are likely to environ us in time to come. If there is no valid reason in the nature of secondary education for separating the child of the professional man from the child of the workingman in the first years of school life, we may be sure that "the people" (to use the American phrase), as they gain a stronger voice in the control of national education, will not encourage this separation.

There is only one valid reason why a family of culture should object to permit its

<sup>1</sup> Paragraph 13, p. 636.

<sup>2</sup> It is true that a considerable number of primary school children are now going forward at about the age of 12 into the grammar schools of large towns and into higher grade board schools, but this is only a recent innovation, and is confined at present within small limits. (See plan opposite.)

children to sit side by side with the children of a lower class—the fear of moral contamination. This reason prevails in those parts of the United States where such contamination is to be feared—for example, in the large cities into which low-class immigrants are constantly pouring, and in many parts of the South. Under such conditions educators can only combat the mischief by training teachers who will understand how to watch over the habits and character of the little ones. Apart from such fear of contamination, it would surely be of benefit to the nation at large if our little children, of the rich and of the poor, in villages and towns alike, could be gathered in infant classes and set out upon their life's journey in company.

At the other end of the scale there is very little difference of practice between England and elsewhere. The superior limit of secondary instruction is determined at about the age of 18 or 19. In America it is often lower, but this is because the arrangements of the college and university are of a special kind which is not found elsewhere, and to which I need not further allude.

9. In comparing types of secondary schools provided in England and in America, we find that in England we have nothing corresponding to the American high school, and I believe that a large gap in our educational system would be supplied by providing schools of somewhat this type in England. The characteristic features of them may be described as follows:

(a) They are governed by the same school board that governs the primary schools and are supported from the same funds.

(b) They admit children by entrance examination after completing the primary and grammar school course, and carry on their education so long as the parents wish, sometimes until they are ready to enter college, but more often up to about the age of 16—that is to say (to use our English phraseology), many of them are first-grade secondary schools, but most of them are second-grade schools.

(c) They are found almost everywhere, in the country as well as in the large towns, as an integral part of the public school system.

Perhaps the most encouraging feature to be observed in the development of American secondary education in the last 20 years is the growth of small high schools in country districts and the desire of the people to have these schools and their willingness to pay for them. In New England such schools have been established for many years, but in the Middle States the movement is of more recent growth. Such rural high schools no doubt lack many of the advantages of a large city school, but their work is by no means to be despised.<sup>1</sup> The boys and girls that attend them very often come from a distance of 3 or 4 miles. In Massachusetts the law now compels a township which has no such school to pay for the conveyance of its high-school children to a school in the nearest township, and to contribute toward their education there.

The curriculum of the rural high school usually includes Latin and a modern language, but scarcely ever Greek. The principal is very often also appointed the superintendent of the elementary schools in his township, and thus the work of the three grades of schools—primary, grammar, and high—is coordinated. Such supervision is, of course, not sufficient by itself; as we shall see below, the lack of proper inspection is one of the main deficiencies in the American school system.

The city high schools are usually large buildings, often containing hundreds of children. The schools of the city of Boston may be taken as a type of the rest. There is, first, the Latin school, which is distinguished from the rest by teaching Greek and offering special preparation for the university; there are the English high schools, which include Latin in their course, but pay most attention to mathematics and natural science, and there is the manual training school, which devotes half of its time to drawing, metal work, or woodwork, and the other half to mathematics, literature, and science. This last type of school is novel and has still many enemies,

<sup>1</sup>See, for example, reports from principals in annual report, 1892-93, of the New Jersey board of education.

but I have found that most writers on education in America have given it their approval.<sup>1</sup>

In the United States these high schools are always free; in Canada a small fee is usually charged, but the fee is never so heavy as to prevent a poor boy from attending, and I am told that it is possible to get a remission of the fee in cases of special necessity.

The discussion on overeducation in a previous paragraph will have served to answer, from the American standpoint, the objection of free schooling. When I have asked an American why the son of wealthy parents should get his schooling for nothing, it has been pointed out to me that the parent pays a much larger proportion of the school tax than poor parents have to pay, and he adds that the high schools are really maintained by the wealth of the country for the benefit of all, rich and poor, who need them.

It certainly appears that the question of school fees, as a consideration in the provision of public education, has but small weight in a democratic country. In Germany fees are, as a rule, demanded even in the primary school; but in every stage of education parents who privately give evidence that they can not afford to pay the fee have it remitted to them. When once it is granted that secondary education can not be self-supporting, and when it is further granted that children of promise ought to be encouraged to mount the educational ladder, there seems little reason for embarrassing the school organization by a complicated system of fees.<sup>2</sup> Our English system of remitting school fees by means of competitive scholarships presents many undesirable elements which our foreign critics are more prone to deplore than English teachers are to admit. It is sometimes overlooked in England that the parents of poor children are not likely to keep the children at school longer than is necessary, even if the secondary schools charge no fees at all, for the burden of maintaining the child at home in place of sending him into trade is a serious deterrent unless both the parents and the child are willing to make sacrifices. What I have seen and learned of the American popular high-school system convinces me that our English people ought to *have liberty to tax themselves* for such an object, and ought to be encouraged by State aid to establish high schools for themselves *wherever a popular demand for them arises*. It is characteristic of the American system that these schools are placed within everyone's reach; it is considered worth while to establish a high school in a township, although only 40 or 50 children are likely to attend it.

There are no statistics in America to enable us to determine what proportion of secondary school children are in boarding schools; but I imagine it does not rise to more than 5 per cent, while in England we have at least 50 per cent in boarding schools. It is held by many English teachers that it is an advantage to the child to be educated away from home, but looking only at the matter of cost, it is clear that the English parent pays many times more for the boarding school-education of his children than the American pays in the school tax which provides for the high-school education of his children. I do not feel at liberty in these pages to discuss the controversy of the boarding and the day school, but I think it will be generally conceded that there is a demand among English parents for good day schools, and there are some eminent teachers who hold the opinion that the peculiar educative features of our good boarding schools can be in a measure grafted upon the day-school system.<sup>3</sup>

10. Outside of this public high-school system, we find in America all the types of English secondary schools except the proprietary school. I have inquired again and

<sup>1</sup>It may be compared with the École Diderot in Paris. See Fitch, Memorandum, p. 29. In the list of reports I have included accounts of some manual training schools and papers relating to them.

<sup>2</sup>If it is possible to speak of "tradition" in America, it would be fair to say that there can be traced a tradition of free high-school education in America from the time when the first grammar schools were established in Boston and elsewhere. This was a tradition brought from England in days when free education was not so distrusted as it appears to be in the present century.

<sup>3</sup>I refer to the proposal, carried into effect at Clifton, Bedford, and elsewhere, of giving "town" boys the benefit of the house-tutor system.—See Journal of Education (London), September, 1884; also Sir J. Crichton Browne, in The Book of Health (Cassell & Co., 1885).

again in the Eastern States to discover whether there are any schools or colleges which are established on the joint stock plan and which pay dividends. I have found that occasionally schools have been established by means of shares, but in none of the cases of which I heard did the articles of agreement permit the payment of a dividend.<sup>1</sup> There are, for example, in Pennsylvania some dozen State normal schools established to give a boarding-school education to elementary teachers and to others. These were built by means of the subscriptions of people interested in the prosperity of their own neighborhood, and the State board of education gives them a helping hand. Half of the trustees are elected by the stockholders, half are appointed by the State board, but no dividend is paid. The whole of the profits are spent upon the improvements of the education. Endowed schools are of many kinds, but they bear a small proportion to the high schools. They are absolutely independent of the State board, and if there are abuses in their management, no public authority is capable of correcting it; nor does such interference seem at present to be necessary, because their prosperity depends upon their being able to offer an education equal to that of the high school. The best of them, of course, being amply endowed with funds and charging high fees to parents, are able to give a better education than that of the high school, and these schools are known as "fitting schools" for Harvard, Yale, or Princeton universities.

I have already pointed out that these schools, including the private-adventure schools, are all called "private schools" in America; and the question is sometimes asked whether the feeling in America is not growing in favor of private schools as opposed to the public-school system.<sup>2</sup> I discussed this question very fully with Commissioner Harris, who, through his statistical bureau, is able to judge accurately of such a movement. He made it clear to me that the slight increase that had been observed in private schools some three years ago, although considerable in itself, was very slight by comparison with the immensely larger number of public schools. The disproportion between the two is entirely different from anything which we have in this country. The reasons for an increase in private schools in America, when it occurs, are special.<sup>3</sup> (a) Parochial, Roman Catholic, or Lutheran schools will, in one State or another, be sometimes provided in opposition to the public elementary schools; and, indeed, the only opposition to the public school system of America comes from the Roman Catholic Church.<sup>4</sup> (b) In the cities an increase of wealth causes an increase of private secondary schools, for people of means often prefer to indulge their personal tastes in the education of their children; on the contrary, a period of bad trade sends the children back to the public schools. (c) When the public school system is notoriously inefficient or is deficient, then the private school supplies the need.

"The private school provides for certain needs that the public schools can not or do not provide for in some localities. There is a margin, therefore, for this kind of education, and it is likely to increase slightly with the increasing wealth of the country. Probably its maximum limit is somewhere in the region of 16 per cent, or 1 in 6, a limit already reached in some States of the North Atlantic Division.

"The feature of the private school that causes its increase with the increasing wealth of the country is not so much that it provides for the separation of one caste from another, nor in that it provides for religious instruction within the limits of a particular denomination, but that it provides for exceptional cases. Wealthy people are able to gratify their peculiar notions as to the course of study and the

<sup>1</sup>In Canada there are several proprietary schools on the English plan. I had no opportunity of making inquiry as to their success, financially or otherwise.

<sup>2</sup>Question 9 in the "Heads of information" runs as follows: "Has there recently been any considerable increase in the principle of private schools in your State? If so, to what do you attribute this increase?"

<sup>3</sup>Question 9 in "Heads of information": "Has there recently been any considerable increase in the number of private schools in your State? If so, to what cause do you attribute this increase?"

<sup>4</sup>See paragraph 27.

kind of discipline that they desire for their children. The private school depends upon personal or corporate enterprise. This enterprise is on the lookout for new subjects of study, new methods of teaching, and new preferences in any direction. It caters for special needs and tastes, offering new devices while they are in the doubtful stage of experiment.

"When the private schools have demonstrated the utility or general popularity of any new departure, the public school boards and superintendents gradually introduce the improvements into the schools supported by taxation, and the private schools lose the pupils that had been attracted to them by their specialties. This is the wholesome feature in the private schools; it saves the bulk of the school system from wasteful experiments. One need only think of the process now going on with reference to the kindergartens, manual training, physical exercise, cooking schools, natural science instruction, and such new movements which are slowly or rapidly gaining a foothold in the public schools.

"Again, the private school is a safety valve in many ways. When the school boards or school committees become niggard in providing good teachers and commodious school buildings by a sufficient outlay of money in salaries and building funds, the best teachers are drawn off into the private schools. The majority of the people see this result with uneasiness, and a change is soon effected in the membership of the school committee by popular election.

"On the other hand, capricious parents who furnish an element of perpetual friction so long as their children are in the public schools, find what they are seeking in the private schools, and can get the requisite variety by changing from one school to another as often as they like."—(W. T. Harris, Commissioner of Education, in article Education in the United States, Shaler's *The United States of America*.)

I found that Dr. Harris's views were, in the main, those of other teachers, including private-school masters, whom I once or twice had the pleasure of meeting. I have found no signs of antagonism between the private-school master and the public-school master, such as sometimes shows itself in England; the place and function of both are recognized, and in the Northwest, where scarcely any private schools are to be found, the opinion is expressed that the educational system suffers by their absence. But, on the other hand, no one suggests that the private school system should be incorporated by means of State aid with the public school system; the distinctive virtues of the private school appear in its absolute independence of State control and State support.

There has never been in the States a condition of things similar to what we find in England, where one-half of the secondary education is being undertaken by private school teachers, and it would obviously be a great hardship and injustice to establish within a brief period a large number of public institutions, which would deprive these teachers of their bread. It would surely be possible to permit local school boards to establish high schools at low fees—subject, however, to the consent of some central educational authority, which would be charged by the legislature with the duty of seeing that such injury to honorable private enterprise was avoided, or that the private teachers received adequate compensation; and, perhaps, as has happened in some parts of New England, struggling grammar schools and private schools might here and there be taken over into the public school system.

It ought to be observed that the public high schools of America do not supply the whole demand for secondary education. In some quarters the people would not pay more than they are now paying in taxation; in other quarters well-endowed private schools already exist; but in the most progressive States the aim is always made to admit every child whose parents wish it to enter the high school, and the plan which prevails, e. g., in Philadelphia, by which grammar-school children can only enter the high school through a competitive examination, is condemned elsewhere.

The distinction which we attempt to make in England between first-grade, second-

grade, and third-grade schools, is not regarded in America as so important, partly because every school desires to make the most of itself and dislikes to be classified as of lower grade than its neighbor. There is, however, a considerable movement in favor of defining more strictly the scope of each kind of high school.

I venture, then, to urge that our principal need in England is for a number of people's high schools, mainly of the second grade, and of such low fees that the poorest children can attend if they will. Such schools will probably also be attended by the children from cultured families, for the degrading influences which may come from contact with gutter children in the primary schools will not affect the high schools, since such children will never rise beyond the primary grades. These high schools would offer curricula adapted to modern needs, not only for pupils intended for the university, but still more for those looking forward to commerce and manufacture. And not the least important of the functions of the American and Canadian high school is to give a secondary education to those intending to teach in the primary schools.<sup>1</sup>

Side by side with these schools the endowed schools would continue to flourish, and ought to look for support not only to State aid but to the generosity of the wealthy; indeed, I greatly doubt whether in England or America secondary education will be adequately supplied out of public taxation. Even the public high schools are now beginning to look to private wealth, through gifts of school buildings and libraries,<sup>2</sup> in order to supplement the public exchequer, and there is no reason why such gifts should not be devoted to public education as readily as they are given for a park or for a people's palace.

11. Here is the proper place to deal with the question of the coeducation<sup>3</sup> of boys and girls. There can be no doubt that the general public opinion in the United States and in Canada is in favor of coeducation. The immense majority of American boys and girls have been educated together at all stages of school life, and it is only here and there that exceptions are found to this rule. The Bureau of Education is now publishing a report on the question, containing the opinions of a large number of teachers and of well-known men and women outside the school, and it is clear that those who distrust coeducation are few in number. I am convinced, however, that this minority, although small, includes a number of very thoughtful and anxious teachers who have watched, perhaps with greater solicitude than others, the development of character in the young. I met a few such teachers. One, the principal of a New England high school attended by some 500 boys and girls, admitted that his position involved grave responsibilities, yet, on the whole, he thought that the advantages of coeducation outweighed the disadvantages, if the school were in the hands of conscientious and vigilant teachers; and, although feeling these anxieties for pupils during the high-school period—that is to say, between the ages of 15 and 18—he saw no serious danger in coeducation at college. On the other hand, I found that an ex-president of an important woman's university realized the serious dangers in coeducation during the college period, but desired to see boys and girls educated together until they came to college. Hence I should conclude that a certain amount of uneasiness among thoughtful persons is felt on the subject, especially in large cities, where children are less under the eye of parents than in the country; but that everyone, without exception, approves of boys and girls being educated together until their high-school age. The only possible objection to this plan might be found in very low and crowded neighborhoods, where children might come from vicious homes.

<sup>1</sup>"More high-school pupils look forward to teaching than to any other immediate occupation. The rural districts draw more teachers from high schools than from any other source."—Report of Inspector of State High Schools, 1894 (Minneapolis, Minn.).

<sup>2</sup>As one example out of several see, in report of the Cambridge school committee, an account of the manual training high school, presented to the school committee by its founder, Mr. Rudge.

<sup>3</sup>Question 1 in the "Heads of information" reads: "What is your experience in the education of boys and girls in the same day schools, or in the same day classes? (2) What is your opinion of the working of the system, and as to the conditions most favorable to it as regards age of scholars, and size of school?"

In view, then, of the possible establishment of high schools in England, I think American experience would at least justify us in establishing high schools for boys and girls together where a scanty population permit only of one school. In Canada, Ontario follows the American plan, Montreal the English plan, and I found that in Ontario the advisability of the American plan is scarcely disputed.<sup>1</sup>

Allied to this is the question of the employment of women or men teachers in high schools, and I venture to urge that it is almost as important as the question of coeducation. England is perhaps the only country in which it is the custom to exclude men teachers from a share in the education of girls, and America differs from Europe in giving women teachers a share in the education of boys. I found opinion in America to be somewhat as follows: It is advantageous for boys to be brought, to some extent, under the influence of women teachers during the whole period of school life, and for girls to be taught, to some extent, by men teachers. No doubt, however, women teachers are employed too extensively in the teaching of boys,<sup>2</sup> and simply because they can be paid lower salaries; but the entire exclusion of women from boys' schools would not be regarded with favor in any section of school work.

The women teachers, it is said, usually excel in patience and steadiness of application to the *details* of school work, whereas men teachers are needed for organizing and directive power. My own conclusions, from what I saw in America, certainly confirm this estimate. I believe that if women teachers in America evinced more power in organization they would more frequently be placed at the head of large schools.

12. It should be noted here that the primary and grammar schools and the various forms of the high school do not cover the whole range of city or county school boards. The attempt is made in most large cities to do something for the needs of special classes: (a) For pupils who have special deficiencies—for example, the deaf and dumb, and the blind—and for disorderly children who are unfitted for the ordinary school. (b) For students desiring to be trained as teachers. Most large cities have their own normal schools, although it does not follow that all the teachers of the city are required to have passed through them. (c) For the needs of technical education.<sup>3</sup> The problem of technical education has received considerable attention in America, not indeed to the same extent as in England or Germany, but valuable experience has been gained during the last ten years. The problem presents itself in two aspects. Firstly, how shall the future needs of the child during its period of general education be allowed to modify the curriculum of the secondary school? Secondly, what provision can be made for technical education *after* the school age, and how shall the child be conducted from the one to the other?

(1) In the American high school, as in the English grammar school, the demand for technical education has resulted in the substitution of technical subjects in place of Latin and Greek, or in the establishment of new classes, or new schools, in which technical subjects shall have the chief place. Formerly the future needs of the child in the secondary school were only studied in the secondary school with a view to prepare him for the university; but, as I have already pointed out, the multiplication of high schools in America, supported and controlled by the people, has led to the development of varieties of courses of study, which will suit the child intended for business or for manufacture. At the same time, this movement is only now in progress; and it is probable that the majority of American high schools still

<sup>1</sup>It should be noted that coeducation can be much more safely adopted in an educational system where children are educated together from the first years of school life, and where society, as in America, has become habituated to a less restrained and watchful attitude toward the association of young people of opposite sex. It would probably be unwise for a high school to educate together boys and girls who had not become accustomed to education in the primary school.

<sup>2</sup>In the States a mixed city high school will usually have about one-quarter of the staff men and the rest women; in Ontario the proportion is the other way.

<sup>3</sup>"Heads of information," Question 4: "What has been found to be the best way of bringing technical into proper relation with general education in your secondary schools?"

offer a general education with no specific bearing upon the child's future employment. The movement in favor of differentiation is a new movement, and it is obviously beset with difficulties, especially the difficulty of finding funds to equip the new departments and efficient teachers to conduct them; but the principle involved is now generally conceded, namely, that the secondary school can not adopt any general course of study to be universally prescribed as the best form of secondary education for every child, and that the educational ideal is not lowered or compromised by regard for the demands of the child's probable career.

As an outcome of these ideas, we have the manual training high school and the alternative courses of study drawn up by the committee of ten. These are the two most striking features in the development of American high schools during the last ten years.

(2) The provision of technical education after the school age does not call for any special comment. Sometimes technical institutes, such as the Industrial Art School in Boston, are maintained by school boards, but, as a rule, this work is left to be done by private endowment. It is felt that technical education is a part of higher education, and higher education, except in the Northwest, is usually left to be provided for by private endowment. There is, however, one great exception to this rule—the nation has endowed scientific agriculture by special grants from the Federal Government.<sup>1</sup>

### SECTION III. *The authorities to be created and coordinated, with the functions and powers which may be given to each.*

13. The problem of school administration is complicated by the variety of authorities and functions which have to be provided for even in the simplest system. We may tabulate as follows the various functions that are undertaken in America by one authority or another:

(a) *The erection and maintenance of buildings.*—(1) Of schools; (2) of training colleges, technical institutions, or universities.

(b) *Teachers.*—Appointment; payment; issue of certificates, either temporary or permanent, local or general; and herewith regulations for the training of teachers and control of training institutions.

(c) *School funds.*—For salaries, for buildings, for libraries and apparatus, for teachers' pensions, for text-books, for scholarships, for inspection and superintendence.

(d) *Inspectors' and examiners' functions,* whether visitatorial or educational, in relation to teachers, to pupils; their appointment and payment.

(e) *Pupils.*—Terms of admission to the secondary from the primary school, and to the higher colleges and universities from the secondary school; by certificate, by competitive examination, by scholarships. Regulations to check truancy, and for taking an annual census of all children of "school age" in each district.

(f) *Codes and courses of study* may be limited to a general plan, such as indicates merely the type and title of the school; or may prescribe an actual curriculum, or may impose a detailed syllabus with text-books.

(g) *School fees and text-books.*—These may be supplied by parents or by public authority, and the text-books may be chosen by the school board or by the superintendent instead of by the teacher.

(h) *Regulation of the length of school studies,* the school day, and the school year, and of vacations and single holidays.

(i) *Advisory functions.*—Publication of reports, statistics, and accounts of educational progress.

I propose to discriminate between the various areas of school administration and to observe how these functions are distributed among them.

*Scope of the Federal Bureau of Education.*—Dr. W. T. Harris, at Washington, kindly

<sup>1</sup> See Annual Report of the Bureau of Education, as well as the report of the State boards which receive and spend the annual appropriation.

supplied me with a number of copies of a pamphlet describing his work, which I have already sent to the commission, and it will be observed how carefully Dr. Harris distinguishes the work of his department in contrast to that of an executive authority. Without itself undertaking any educational act,<sup>1</sup> the Department assists others all over the States, both individuals and corporations, in the discharge of their tasks by supplying them with information. Its duties are, in fact, similar to those of the department of labor or those of the National Association for the Promotion of Technical and Secondary Education in England. One important part of the work of the Bureau is statistical, and every student of education in the United States finds his indebtedness to the material supplied by the annual report. This statistical work must, of course, be undertaken by the central authority of any nation which organizes education. Unfortunately the independence of the different States seems to make it impossible for the Bureau to *compel* the production of accurate reports, and, in consequence, some of the conclusions reached in the statistical department are in the nature of estimates rather than absolutely reliable conclusions.

In addition to this statistical work, specialists are employed to inquire into foreign systems of education, and, in fact, the department may be regarded as a laboratory for scientific research in the field of comparative education.<sup>2</sup>

And again, the Bureau is expected to watch the important educational questions of the day, and assist in their solution by means of its central position and distributing power. Thus in the last few years it has dealt with libraries, which are usually regarded as a part of the educational plan, and has published useful catalogues which may be employed by any local authority desirous of encouraging good taste in literature. Recently it has made inquiries on the question of coeducation, and, as I have already observed, is publishing a monograph on the subject. Last year, when the National Association took up the question of courses of study in secondary schools, the Bureau appropriately offered its services in assisting to collect material and in printing and publishing the report.

This large field of labor is somewhat costly. The office receives an appropriation at present of £14,000 per annum. It is regarded as a subdepartment of the Department of the Interior.

There are, it seems, two reasons which justify the expenditure of this large sum. Firstly, education in these modern days makes demands similar to those of commerce and agriculture and scientific research. Every worker in one corner of the field needs to be supplied with material collected from the experience of the country or of the whole world, in order to enable him to work efficiently. Naturally this principle is admitted in the New World more readily than in the Old, for the newer countries have few traditions and are more ready to learn.

Secondly, the principle indicated in paragraph 4 supplies a special reason for the study of comparative education. When once it is admitted that the whole range of education may be subject to criticism and reform, we are compelled to examine into every variety of educational enterprise in order to discover what records of successful achievement may be found which will help to guide our efforts.

The following paragraph from the report of the Province of Ontario,<sup>3</sup> which was

<sup>1</sup> It does a little administrative work in Alaska, and also in relation to agricultural education; but this work lies beyond the main purpose of the Bureau.

<sup>2</sup> It may, of course, be questioned whether such investigation is properly to be included within the functions of government. On certain sides of it the work might be equally well done by the pedagogic department of a research university; indeed, Prof. G. Stanley Hall, at Clark University, devotes considerable attention to comparative education. But a government office has advantages which no other organization can secure.

<sup>3</sup> The Hon. G. W. Ross, minister of education in Ontario, permits me to say that his department has been frequently indebted to the work of the Washington Bureau of Education, and he has no question that an efficient department of the kind established in London, *on an imperial basis*, for the benefit of education throughout the British Empire, would be regarded as a boon, and would receive support from the colonies.

presented to the Columbian Exhibition, shows how our colonies have recognized the need for the study of comparative education:

"The system of education in Ontario may be said to combine the best features of the systems of several countries. To the Old World it is indebted for a large measure of its stability, uniformity, and centralization; to the older settled parts of the New World for its popular nature, its flexibility, and its democratic principles, which have given, wherever desirable, local control and individual responsibility. From the State of New York we have borrowed the machinery of our schools; from Massachusetts, the principle of local taxation; from Ireland, our first series of text-books; from Scotland, the cooperation of parents with the teacher in upholding his authority; from Germany, the system of normal schools and the kindergarten, and from the United States generally the non-denominational character of elementary, secondary, and university education."

This duty of collecting statistics and reporting upon educational progress is not confined in America to the Bureau of Education; it is regarded as an important function of every State board and of all important city boards. Thus the superintendent of schools in Boston reports to his school committee:<sup>1</sup>

"In bringing this report to a close, it may be well to advert in a few words to its main purpose, which is not so much to express a critical estimate of the matters touched upon as to communicate a mass of information concerning the history and present condition of our school work. This information is offered as raw material for the manufacture of views and opinions, or as a useful contribution to current educational discussion. Educational discussion is going on all the time, both in school circles and in the community outside; but there is no greater need than that discussion should proceed upon full and accurate information. Inasmuch as such discussion turns largely upon those features of the school system which are susceptible of improvement, the information thus drawn out is apt to wear the aspect of unfavorable criticism; but it is unfavorable criticism in appearance only, the great underlying fact being that the system itself is strong and active and fruitful of good results. It is a sign of vitality and health in the system that it should be constantly mending its imperfections, mending them even under public observation."

I venture to urge that the education, and especially the secondary education, of England would be materially assisted by the establishment of some similar institution. Obviously some central authority must collect statistics, if any progress in organization is to be made at all, and if the best use is to be made of these statistics, they should be taken in hand by educational experts, and it would surely be an advantage if the scope of such an office were imperial and not simply national.

The following note from New Brunswick shows that our colonies would appreciate a service of this kind:

"In the course of the proceedings at the annual meeting of the New Brunswick Teachers' Institute, the chief superintendent declared that it would conduce to the advantage of the colony if there were established at Ottawa an educational bureau under the direction of a man of the ability and enthusiasm possessed by the United States Commissioner at Washington. There was an ample field and abundance of work for such a man and such an office without encroaching in the slightest degree upon the educational autonomy of any individual province. The generous maintenance of such a department by the Federal Government would tend to solve many knotty problems, and could scarcely fail to promote the educational work of every part of the Dominion. The proposal is to be commended, if only as likely to further that inter-provincial reciprocity in the acceptance of teachers' certificates which the members of the institute desire."<sup>2</sup>

It may, perhaps, be doubted whether some of the material published by the

<sup>1</sup> Annual Report, 1892, pp. 63, 64.

<sup>2</sup> Report of Annual Meeting, Teachers' Institute, New Brunswick, July, 1893.

Bureau, or by State boards of education, is worth the time and money spent upon it. No doubt there is some waste, more perhaps in the publications of State and municipal boards than in those of the Bureau; but I found that there were no two opinions among those I consulted in the United States as to the value of the work done at Washington, and of its direct benefit to all teachers, both in public schools and in private schools.

14. *State boards of education.*—Coming now to the functions of the State boards, it is to be observed how jealously each State preserves its own autonomy; and, since most of the States cover an immense area, and are continually increasing in population, there is no reason why its independence should be sacrificed, although, no doubt, the more backward States suffer from the lack of a vigorous educational system, and the independence of each State from its neighbor secures one great advantage which we in England have begun to reap since the technical instruction act for the first time gave power of independent initiative to county authorities. Each State learns by the experience, by the success or failure of its neighbor. An experiment tried in one State is certain to be copied in others if it succeeds. The same benefit has been found in Germany, especially in the little States, where experiments can be more easily made than in a great kingdom like Prussia; particularly cities like Frankfort, or dukedoms like Sachs-Weimar, make experiments in educational reform, and the process is watched with interest all over the country.

On the contrary, in a bureaucratic system such as prevails in Ontario, or in France, the individual teachers have little encouragement or opportunity to work out new experiments for themselves, and progress can only be made when the central authority is convinced of the utility of a reform which has been wrought out beyond its borders.

It has, I believe, been suggested that England, for purposes of education, should be divided into some half-dozen provinces,<sup>1</sup> each including within its limits one or two of our universities or university colleges, and each of them competent to serve by itself as the largest area for the public educational authority. The experience of Germany and of America seem to show that a province or a State which is large enough to support one or two universities on the apex of the educational system is large enough for autonomy.

15. It is generally admitted by thoughtful teachers in America that the State board of education is the weakest part of the educational system. The jealousy with which the township and the city protects its independence has hitherto prevented those functions which need to be administered centrally from developing proper activity; and, indeed, no clear conception seems yet to have been formed as to the precise duties which need to be administered from the center of the State, nor are serious proposals yet made to constitute an authority adequate to their performance.

The State board of education is composed of politicians—sometimes nominated by the governor, sometimes elected by the legislature—and they have no claim to speak with authority on matters of education. They employ an educational expert—the State superintendent<sup>2</sup>—but he is often appointed for political reasons, and is very seldom regarded as a power in the educational world.<sup>3</sup>

The functions which, apparently, need to be administered from the central authority are, first of all, those which local boards are not competent to undertake, such as the training of teachers, the provision of higher education, and the inspection of

<sup>1</sup> Compare a similar suggestion in Fraser's report, p. 320: "A central board, exercising more or less of actual visitatorial power over the middle and upper schools within a given area—say a 'county,' or one of those districts into which England is already divided by the registrar-general for statistical purposes."

<sup>2</sup> On the office of superintendent, see p. 645.

<sup>3</sup> I am of course speaking generally. There are some notable exceptions; and, as I shall point out later, there are two or three States which have a well-organized plan for controlling secondary education by a central authority.

schools;<sup>1</sup> secondly, those in which the cooperation of all local authorities is essential; for instance, the arrangements for leaving certificates from the secondary school to the university.

The functions of the State board in most of the States might be greatly extended if the board was so constituted as to carry weight with the local educational authorities; that is to say, if it was composed largely of men of experience in school work, some of them elected by the teachers of various grades, others nominated by local school boards on account of their qualifications. In one or two cases the State school board has recently secured the services of eminent schoolmen; and I have observed, particularly in the State of New Jersey, the advantage which has been secured to the State as a result, for the work that has to be done by the school board is mainly professional in its nature, and needs to be administered, not by laymen, but by men who have had experience in teaching.

Many of the States possess a large State school fund, which is distributed among the schools, and it is given away without any adequate guaranty that it is going to be well spent. The inspection of the schools is left in the hands of local superintendents, who are agents of the local school boards. The money is usually allotted on the basis of school attendance, the only additional requirement being that the schools receiving the aid shall be open for so many school days per annum. Sometimes the grant is made conditional upon an equal amount being raised by local taxation, but even this provision does not prevail everywhere, and there are still school districts which spend no more upon their schools than they receive from the State. In one or two States special grants in aid are made to rural districts which are thinly populated and can not fairly be expected to support their own schools.<sup>2</sup>

There are two States which present a striking contrast to the rest in this matter of State control. In New York State there has existed during the whole of the century a unique institution called the University of the State of New York, which is not, in the ordinary sense of the word, a university at all, but is a body charged with the control of secondary and higher education. The officers of this university, called regents, are elected by the legislature; but, owing to the important sphere intrusted to them, they are usually men of academic position. Under this authority a system has been organized which exercises a most powerful influence upon every high school in the State. It possesses a school fund, which it distributes by a strict method of payment by results, the results being determined by a system of uniform written examinations on papers issued from the central office of the university in Albany.

A somewhat similar system prevails in Minnesota, and in Ontario, Canada, where an examination for leaving certificates has been instituted for all high schools. On the result of this examination students are admitted to enter for university or professional education.

In these cases we observe the manifest advantage gained by compelling the universities and the schools to unite in the provision of leaving certificates, and, although I believe that the uniform written examination contains elements of mischief to education, it is obvious that the regulation of leaving certificates is one of the most important duties of the central educational council.

If, in Ontario and in New York State, the central authority consisted of professional men of similar rank to those constituting the chartered medical societies in England, it is likely that the leaving certificate would be arranged more in accordance with sound educational principles; but the advantage of securing by law an authority to regulate this matter for the whole State can scarcely be exaggerated.

A similar observation applies to the work of school inspection of schools. Ontario, New York State, and Minnesota are once more distinguished from

<sup>1</sup> Circular of Information, issued by the Bureau, 1880. Also, Plan of Educational Organization, by Professor Smart, of Indiana, published by the Bureau at the same time.

<sup>2</sup> Report of Board of Education in Massachusetts, 1892-93, p. 105.

their neighbors by possessing a high-school inspectorate, independent of local control.<sup>1</sup>

The lack of central control is also recognized in relation to the registration and training of teachers. It is true that the State boards of education everywhere authorize their superintendent to grant State certificates, but teachers are not compelled to obtain these certificates in order to teach in any school. The county or the city certificate is sufficient, and the result is that in many States the qualification of the teacher is appallingly low. This charge must be directed, however, against primary rather than against secondary education.

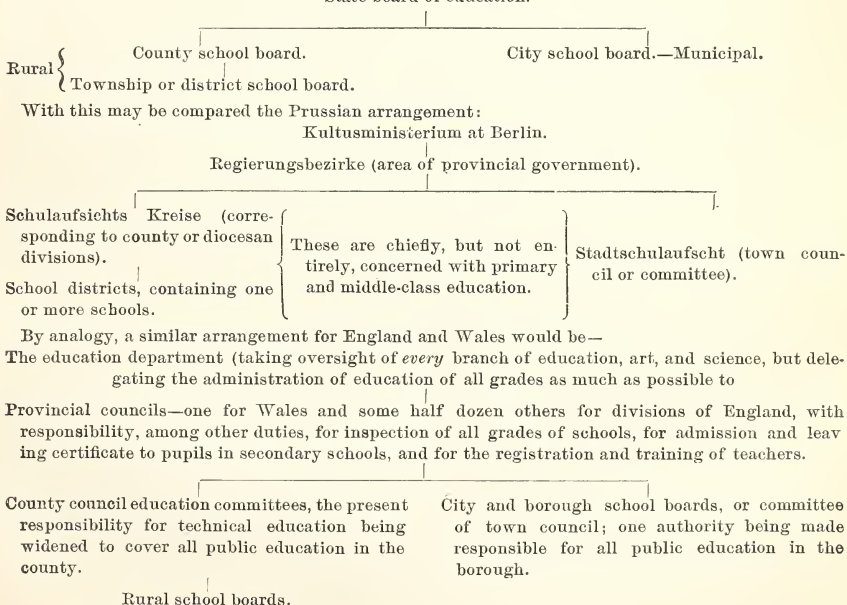

Speaking generally, then, the functions of the State board partly resemble those of the National Bureau of Education, partly are directed to aid, or to control in imperfect fashion, the work which is really done by each locality for itself.

Nevertheless, most of the States have permitted the boards to undertake certain departments of higher education which special circumstances seem to have made advisable. Thus, most State boards of education have charge of a few normal schools; nearly all have established agricultural colleges, and in the Northwest we find State universities. In recent years also the boards have begun to control professional examinations by establishing diplomas for physicians and lawyers under the direction of State boards, and in time we may expect to see the State control extended so as to cover the whole ground of professional studies and of school inspection. So long as this control and this cooperation can be exercised without endangering the freedom of the teacher, it can not but be helpful to progress.

16. For education, as for all the duties of local government, the State is divided into counties, and the county into townships.<sup>2</sup> In Massachusetts, and elsewhere, the townships had been formally divided into districts, each district being autonomous and having trustees to administer its own little school; but experience has condemned the selection for the unit of an area so small as to include one or two

<sup>1</sup> See Appendix I, where I have inserted copies of the forms sent out to principals of high schools and also those used by the inspectors.

<sup>2</sup> State board of education.

schools only. The mischief gradually caused was pointed out in Fraser's report, and is being thereby remedied by the legislatures of the States concerned.

It seems to be generally agreed that the best area in rural districts for a school authority is one which contains enough primary schools to feed at least one small high school with pupils—that is to say, every unit of school government ought to contain at least one high school. Very often the high school in a sparsely populated district will only be attended by 40 or 50 pupils, but the existence of this school is sufficient to give a focus to the education of the district, and to provide in the principal of the school a supervisor of experience, qualified to direct the educational work of the whole area.

The board which governs such a school district or township is elected by the people, and possesses by far the largest share of authority, since the authority of the county board and of the State board above it is so weak. It erects the school buildings, appoints and pays the teachers, and in some cases is permitted to issue a temporary certificate to a teacher who has not obtained any certificate whatever from the State or the county. It receives, as we have seen, a grant of money from the State, and must raise by local taxation whatever is needed to supplement this. It appoints its own superintendent for its schools, and, under his advice, it prescribes a curriculum and text-books. It also fixes the length of the school day and of the vacations and holidays; and it usually employs a truant officer, who is charged with the duty of collecting a census of all children of school age (5 to 15). Sometimes the census is taken by a county officer; in Toronto, by the assessors of taxes. In districts where a proper census is taken, it becomes a most valuable adjunct to the statistical material required in order to estimate the needs of public education. It not only enables the truant officers to find out children whose education is neglected, but it exhibits the share in education performed by private institutions. The annual school census seems to be a recognized aid to a thorough educational system.

Between the township school board or committee and the State board comes the county board, which, as a rule, exercises an influence slighter even than that of the State board. Its functions are chiefly exercised by its superintendent, who examines candidates desirous of teaching and issues certificates which enable them to teach in schools *within the county limits* for a limited period of years. This influence over the teachers is extended by visits to the schools, by lectures at teachers' gatherings, and especially by conducting the teachers' institutes (see p. 52), at which all the teachers within the county are assembled.

The county board reports to the State board upon the progress of education, and in some States has a voice in the distribution of the State school fund. Only one county normal school is known to me; it happens to have for its principal one of the most distinguished of American teachers. Usually the county board and its superintendent are elected by popular vote; in New Jersey an effort has been made to enlarge the powers of the county superintendent, and he is appointed by the State board, and his tenure of office is more permanent.

Speaking generally, then, the chief authority in the control of rural schools, including rural high schools, is the smallest local authority, the district or township board. The authority of the county board and of the State board is extremely limited.

17. From the scheme given on page 641, it will be seen that the city board of education is treated by the State as independent of the county, and it is, in fact, independent of the State board also; its subordination to the State board of education is merely nominal. It receives from the State school fund a certain appropriation per head for the education of its children; but in most of the States it pays back into the State exchequer a greater sum than it receives, because the property tax from which the school fund is obtained produces far more in the city than in the country. In some States and cities,<sup>1</sup> however, property does not require to be seriously

<sup>1</sup> Chicago is an example; the particular sections of land set apart for school support happen to lie in the best part of the city, and their sale has created a most valuable school fund.

taxed on behalf of the schools, because the public lands, which at an early date were set apart for the benefit of education, produce a large sum of money.<sup>1</sup>

Some of the cities in the United States, where the people have displayed an earnest desire for good education, present most interesting fields of study. The school boards have taken pains to secure superintendents of high reputation, and under such guidance the instruction in the schools is transformed in very few years. Cleveland and Indianapolis<sup>2</sup> at this moment, and St. Louis and Philadelphia some years ago, were examples of this mode of reform. A country with a bureaucratic system of control would never witness such reforms; nor, on the other hand, would cities indifferent to education be permitted to neglect their duty so shamefully as is often done in other cities in the United States.

18. The State board of education is sometimes nominated by the governor of a State, sometimes elected by the senate or the assembly; and the superintendent of instruction is sometimes appointed by the governor or by the school board, or is even elected by popular vote. The variety of methods is due to a conflict of aims. The majority of the people desire to see education kept "out of politics," and to secure members for these boards who are something more than professional politicians. The degradation of American politics makes it impossible for large powers in education to be intrusted to the nominees of the governor or the senate, although many times over I have been assured of the anxiety which is felt by the people themselves as well as by men of culture to see education conducted without reference to politics. I have inquired whether it would not be possible to constitute some kind of educational council, containing representatives of the teachers and of the universities, on lines similar to the organization in England of the medical or the legal profession, but apparently the time is not ripe for the professional organization of the teaching body.

In New York State, where, as I have already said, secondary education is formally controlled by the regents, some slight power by way of advice is placed in the hands of a committee of presidents of colleges and of principals of schools, but this power is nothing more than advisory, and, as a result, I have the impression that the methods employed by the regents are not so wisely directed to the benefit of education as they might be. The regents, being specially intrusted with the care of secondary and higher education, are always highly educated men, but they are the nominees of the governor, and they would be more likely to represent the educational wisdom in the State if some of them were chosen by their fellow-teachers.

The functions of the county board are so slight that the mode of its appointment need not be described. The school trustees of the rural township are elected by the people, and their efficiency as an executive body varies greatly in different parts of the country. In New England, where traditions of good schooling are more than three hundred years old, the work will be efficiently performed, but in other districts the main object of the trustees is to keep school open with the smallest local outlay; in such districts, of course high schools are out of the question.

The mode of appointment of the city board varies also; sometimes the mayor, sometimes the judges, sometimes the city council, sometimes the people themselves choose the members. Everywhere the same desire is expressed to elect a board which will keep education out of politics, and the strenuous efforts made to achieve this end show how difficult a task this is. While city councillors are paid a salary, members of school boards are never paid; and yet there can be no doubt that in a hundred ways the machinery of the school board is manipulated to serve the baser ends of party politics in places where the sense of public duty is low. It is, of course, much easier to point to the disease than to prescribe a remedy.

---

<sup>1</sup>Chicago is an example; the particular sections of land set apart for school support happen to lie in the best part of the city, and their sale has created a most valuable school fund.

<sup>2</sup>The articles contributed by Dr. Rice to *The Forum* in 1892-93 afford a powerful, though it appears somewhat one-sided, criticism of city school systems in the United States.

I have inquired whether the plan of nominating a number of members of the council by cooptation from educated men in the community, not associated with a party, would be acceptable, but such a proposal, I am told, has never been made. In the few cities where a vigorous attempt has been made to check the evils of corruption, it has taken the form of placing greater power in the hands of the superintendent of instruction.

19. Turning back now to the functions mentioned in paragraph 13, which are undertaken by one or the other of these boards, we find as follows:

- (a) The State board or department of education generally establishes its own normal colleges, schools for special classes, such as the deaf and dumb, very often technical institutions, and sometimes universities, but beyond this range its authority in the erection and maintenance of school buildings is very slight. Local authorities for rural or municipal areas have power to build and maintain both elementary and secondary schools at will, and no superior State authority controls either the building plan or the ventilation or other matters, which in England and Germany are supervised from the central office.
- (b) The local authority has absolute control over the appointment and payment of teachers. The city boards issue their own certificates, while the rural boards are only allowed to employ teachers who are certificated by the county board; but this important task is very inefficiently performed by the county board, and the whole method of certifying and employing teachers is admitted to be unsatisfactory. The State board can issue certificates, but the immense majority of teachers never trouble to apply for them.
- (c) Finance:

20. (i) *Provision of funds for schools.*—The township board can raise a local rate and also receives financial aid from the State board, or the county board, or both, and its aid is usually calculated merely upon the numbers in general attendance. In one or two States a system of payment by results has been instituted, and in some cases superintendents or inspectors are appointed at the State cost, but it is only here and there that we find the power that the State ought to exercise by means of its financial aid employed with real effect to encourage good education and to repress incompetency. The system sanctioned by our technical instruction act of giving grants of money to schools outside of the public school system is very rarely found in America.

It has been noted above that secondary education is never regarded as self-supporting in America, and in theory every State regards itself as responsible for the provision of adequate secondary instruction; but it is only here and there that we find this obligation properly fulfilled. In many places if the public authority were called upon to provide school places for all children who are receiving secondary instruction the task would be utterly beyond their powers, for private endowment has always been generous in aiding secondary schools where such schools have gained a footing; and where, as in the West, the whole field of higher education is being undertaken on the socialistic basis by the State, it is being found, as I am told, that the State is unable to cope with the task, and it becomes a problem how to induce private donors to aid in this object with their wealth when the State has once assumed the entire responsibility of educating its children. The question is already causing anxiety in the State universities of the Northwest, and in England we shall have the problem before us in another form. At present, for reasons special to our time, very little endowment in proportion to the wealth of the country is forthcoming, either for secondary or higher education, but we may perhaps look forward to a revival of interest in the subject such as we are witnessing now in America. Now, if such a revival takes place it would be natural to expect a stream of gifts to educational institutions; but if the legislature undertakes education from the socialistic standpoint and endeavors to provide for all its needs out of the

public exchequer it may be questioned whether the flow of wealth from individuals will not cease.<sup>1</sup> The danger of arresting the stream of endowment is a serious one, and it suggests that public aid to secondary education should, so far as possible, take the course adopted in recent years for the support of higher education in England from the exchequer; that is to say, by grants on a scale proportioned to the spirit of generosity displayed by the locality, leaving the control of the institutions mainly in the hands of the locality. The unfortunate result of attempting to supply the whole educational need of a country through an educational department, relying only on public taxes, is exhibited in the Province of Ontario, in Canada, where the ministry, although inspired by an enlightened zeal on behalf of education, is unable to find funds to provide for the necessities of its higher institutions,<sup>2</sup> for its wealthy men have not formed the habit of contributing their aid, as is shown in other parts of Canada and in the United States.

(ii) *Expenditure; scholarships.*—The promotion of education by means of scholarships, which continually receives new developments in England, is not favored either in the States or in Canada. Scholarships are found here and there, but the general sentiment is against their employment as a means of promoting education on a large scale. It is held that money spent in this way would be better spent in reducing the fees or in employing better teachers and better inspection. Indeed, the whole principle of stimulating either the teacher or the pupil by competition is distrusted.

*Pensions.*—I have not found that schemes for teachers' pensions are receiving much attention in America, the reason being that so many teachers are engaged in the profession for only a few years. Teaching is still to many men, as well as to most women, a temporary means of livelihood, which will later on be dropped.

(d) *Inspection:*

21. One of the features of the United States system is the employment by every school board of an expert, usually called the superintendent. He is the chief executive officer of the State board, county board, city board, or township board. Sometimes, as in Massachusetts, he is also secretary of his board, and very often in small cities or townships containing only one high school he is also principal of the high school. His position and duties may be best illustrated by contrasting them with those of Her Majesty's inspectors of schools in England.

(1) His appointment is not of a permanent nature; it has to be renewed every two, three, or four years; and districts are still found where the change of political parties will involve the dismissal of the school superintendent and his staff. Instead of being, as in England, the servant of the central authority, he is the servant of the local authority.

(2) While the English inspector is only concerned with primary education, the superintendent's control, like that of his board, covers the whole range of schools. Hence the creation in the States of a class of university men who become experienced teachers, familiar with all the problems that present themselves from the youngest school age up to the university period.

(3) As the professional adviser of the board, the superintendent has a very large influence in the appointment of teachers. It is true that the principals of the schools are always consulted in these appointments, and the successful principal of a high school is permitted a large amount of independence,<sup>3</sup> but it is the board that makes

<sup>1</sup> See paragraph 10, and note.

<sup>2</sup> I am not quoting the expressed opinions of the department, but it is obvious from a comparison of the equipment of the university and other institutions in Toronto with those in the United States that the lack of means is seriously felt; the education department can not find funds to meet all requirements. Everyone in Canada notices the contrast between the generous support accorded, solely by private individuals, to McGill College, at Montreal, with the struggling needs of the university at Toronto, which has been taught to rely solely upon the State.

<sup>3</sup> City boards usually appoint a small committee to manage the details of each high school, and the principal will usually be invited to its meetings—indeed, it would be difficult to transact business in his absence. If teachers in the United States were professionally organized, the principals of high schools would probably make a claim to attend such committees as a right. In Ontario I heard a complaint that high school trustees were acting without consulting the principal; in England the same difficulty has been felt, and I understand that the Head Masters' Association has given attention to the subject.

the actual appointment, and if a difference arose between the superintendent and the school principal the board would probably support the superintendent.

I have talked with a number of high school principals as to the possibility of friction between themselves and their board or its superintendent, and I find that here, as in Germany, the position of a principal is very different to that of an English head master; our head masters would certainly protest most vigorously against the limitations of authority which are imposed upon the principals of German or American secondary schools. But I am bound to confess that I see no reason why as good an educational result may not be produced on a system in which the principal's authority is much more limited than it is among ourselves; the idea of undivided responsibility which attaches to the office of the head master is rarely found outside of England. The superintendent, however, does not "interfere" very much with the authority of his high school principals, because they stand very much on a level with him both in reputation and in salary.

The course of studies for the high schools is issued on the authority of the board of education, but the principals have the main voice in putting it together. It is well understood that the influence of the superintendent upon instruction shall be mainly directed to the primary and grammar schools, which are in the hands of less experienced teachers, chiefly young women, who need more direction and supervision.

(4) While the English inspector is limited by the instructions of the department, the superintendent, if he is a man of original educational ideas and is able to influence his board, has the opportunity of making very great progress in the educational system of his district; and those cities and counties in which during the last few years there has been pronounced improvement are indebted to the vigorous initiative of the superintendent who, in some cases, has been specially summoned to come to the rescue of a city where the lack of good education was painfully felt.<sup>1</sup>

On the other hand, a worthless superintendent will soon ruin the schools under his control, for there is no efficient check from a central authority.

(5) In the larger cities the efficiency of the superintendent is hindered by the mass of statistical and office work which the immense number of schools and teachers under his charge brings with it. He is supposed to visit each school and to be able to advise teachers in every part of the city; but the task is too great, and I have met one superintendent, who is ambitious to improve school methods, who deliberately left a city of 50,000 inhabitants to take the superintendency of one containing only 10,000 inhabitants, because he felt that he could only exercise effective personal influence in the smaller area.

Some of the larger cities, such as Boston, appoint a number of assistant superintendents or supervisors, who take charge of separate districts, and thus the evil is remedied.

If the claim of local authorities to a large power of initiative in education be once granted, it appears that some expert officer like the superintendent is necessary, and the employment by our county councils of an expert secretary to technical instruction committees seems an evidence in favor of this view. Without the superintendency American education could not be carried on at all, and the defects of the system need to be remedied, not by abolishing the office, but by introducing more inspection and more superintendence from the central authority; this, one hopes, may be done without imposing, as in Ontario and New York State, a uniform system of simultaneous paper examinations.

The inspectorate of New York State and of Ontario demands a little further notice. In New York State the regents have recently appointed 3 or 4 inspectors, with the conviction that the certificate paper examinations do not, by themselves, afford a sufficient test of the progress of the high schools, and in Ontario 2 high school inspectors have been appointed who spend their time in visiting the high schools under the department.<sup>2</sup> In both instances I found that the visits of these inspectors

<sup>1</sup> See paragraph 17 above.

<sup>2</sup> See Appendix I.

were welcomed by the principals of the schools, and the only objection to the further development of the inspectorate is its cost.

In New York State one of the inspectors is specially qualified to advise on the provision of apparatus for science teaching, and his services are placed at the disposal of schools which invite his assistance.

It will be seen from the schedules which I have added as an appendix to this report, that the scope of the inquiry made by these inspectors is very wide, and enables the central authority to form an accurate opinion as to the condition of higher education in the State.

I venture to urge that the provision of a public system of secondary education in England must carry with it a system of inspectorate from the central authority, and there seems to be little reason in the nature of things for establishing a secondary school inspectorate apart from the inspectorate of primary schools. An objection to such inspection is often raised on the ground that no one man, however talented, is sufficiently familiar with all the branches of study in a secondary school to be able to examine into the work of the highest forms. A detailed or formal examination, however, is not necessary to inspection; our head masters are able to control the work done in every branch of instruction; why should not inspectors be able to do the same?

In addition to the central inspectorate, the experience of America seems to point to the necessity of local supervision on the part of an experienced superintendent or inspector serving under the local authority, who would give an impulse to that local activity which is likely to be suppressed if the whole direction of education is left to the central authority.

22. (e) *Terms of admission from the primary school to the secondary school, and from the secondary school to college.*—No educational questions have been more keenly debated in the United States during recent years than those concerned with the passing of pupils from one stage of education to the next above it, and with reason, for upon a wise solution of these questions the efficiency of secondary instruction largely depends.<sup>1</sup>

*Admission to the secondary school.*—There are two opposite methods which are employed by superintendents in promotion:

Firstly, by simultaneous printed papers making up a primary school leaving examination, imposed on all the pupils of a city or a district.

Secondly, by the certificate of the principal of the primary school, declaring that the pupil has properly completed the primary course of study.

The first method is similar to the university local machinery employed so extensively in England. The second bears more points of similarity to the leaving certificates which are issued by every type of public school in Germany. I hesitate to offer argument upon the controversy raised by these two contrasting methods, partly because my own experience as an English teacher has led me to conceive what is, perhaps, a prejudice against the simultaneous written examination employed by our universities and secondary schools in England, and also because I have had no opportunity in America of testing the work done under one system or the other. There has, indeed, been too much vague attack and destructive criticism upon the written-examination system, without any attempt to construct an efficient substitute. This was the error made by Mr. Auberon Herbert and those who joined him in his famous onslaught in 1888.<sup>2</sup> The practical problem is, how shall a trustworthy plan be devised to enable admission and leaving certificates to be issued on a large scale, and at a moderate cost, which will be acceptable to universities and the like, without

<sup>1</sup> Compare Fitch, Memorandum, on the Certificat d'Etudes in France. I agree with him that this is a matter of the first importance, to be regulated by State control; but I think that we must look to Germany rather than to France for a wise method of conducting the examinations, if we are to avoid grave injury to the teacher's work.

<sup>2</sup> Nineteenth Century, November, 1888.

resorting to simultaneous papers, or incurring the grave injury to instruction which these involve? I believe that such a plan can be devised, and that Germany and the United States are showing us how to arrive at it.

My opportunities of comparing English school work with German school work have been sufficient to enable me to state that German instruction, conducted and completed apart from simultaneous printed examination papers, is as efficient as English instruction, which is made so dependent upon this form of stimulus and control. My observation in America has enabled me to note that strong efforts are being made, even by those who employ simultaneous printed papers,<sup>1</sup> to find a satisfactory substitute for them, and a recent investigation into the methods of promotion<sup>2</sup> seems to show that the simultaneous paper is employed to a much less extent than formerly. Indeed, the history in America of this mode of examination is similar to its history in England.<sup>3</sup> It came into being as a cheap and convenient device, which could be readily employed to compel every teacher to raise his work up to a respectable standard. As a matter of history, the system was introduced to cure idleness and inefficiency; but it can not do more than this, it can not point the way to better teaching, for the best results of instruction fail to be tested by the printed question paper, while it tends to encourage aims and methods of teaching which are unworthy.

Apart, however, from the investigation of the right mode of examining, it is obvious that the question of admission to the secondary school is one that needs careful attention from the authorities that organize education, and it is one in which primary school teachers, as well as secondary teachers, ought to have some voice; and herein the United States claims an advantage, because the primary and the secondary schools are under the same local authority.

In Ontario the whole system of certificates is administered by the Education Department, and the minister seeks advice when he needs it from all classes of teachers as to the character of the examination which he imposes. In New York State the regents impose their own entrance examinations for admission to high schools, and here, also, their power is unchecked; they are not compelled to follow the advice either of primary or secondary teachers. The advantages in these two States of a uniform system of certificates are undoubted, but it would surely be to the advantage of the schools if these certificates were issued under the authority of a professional council on which both primary and secondary teachers were represented. In England the only attempts, so far as I know, that have been made to create a uniform standard of admission to secondary schools are those concerned with competitive scholarships,<sup>4</sup> and here the experience of America is in direct opposition to English practice; no scholarships to high schools from grammar schools exist, because the high schools offer free tuition, and the endowed and private schools have never commenced such a practice. Sometimes a competitive entrance examination is imposed for admission to high schools, as in Philadelphia, and perhaps in other places where sufficient accommodation has not been provided by the board, but I found even in Philadelphia that this competition was not regarded with favor; indeed, I have not met with a single teacher in America who attached educational value to the principle of stimulus by competition for scholarships, prizes, or certificates, and this is true of Ontario as well as of the States.

<sup>1</sup> Particularly in Ontario, where I found considerable effort being made to minimize the evils of the system; everyone regarded it as an imperfect plan, but they adhere to it until something better can be found. (See Memorandum for Principals of Schools, Circular 21, Ed. Dept., Toronto, January, 1894.)

<sup>2</sup> Promotions and Examinations in Graded Schools, by Dr. E. E. White (Washington, Government Printing Office, 1891, Circular No. 7 from the Bureau). Dr. E. E. White has long been a recognized authority on education. (See Fraser's Report, p. 10.)

<sup>3</sup> It may be noted in passing that, while the examination system in England originated in the universities and has by them been extended over the schools, the American universities give little place to examination apart from teaching. They maintain the German principle—that the teacher may be inspected as much as you please, but his pupils must be examined by himself in the matter and the form in which he has taught them.

<sup>4</sup> I refer particularly to the examination now conducted in London, under the auspices, of the Head Masters' Association, for scholarships from elementary to secondary schools.

23. *Admission to college from the secondary school.*—There does not appear to be any absolute necessity for a precisely uniform standard of admission from the primary to the secondary school in all parts of a State. One might conceive of local conditions where it would be better for the standard of admission to a high school to be lower or higher than in other neighborhoods; with regard, however, to the leaving certificate admitting to college, uniformity of standard is surely essential, and one of the most crying evils in our want of system in England is due to the multiplicity of examinations imposed by the different universities and the professional schools of law and medicine.

I may note, in passing, that very few students enter American universities without having been pupils in some secondary school,<sup>1</sup> i. e., very few prepare for the university by the aid of private tutors. Anything like the "correspondence" method of obtaining a London degree is unknown in America. Dr. Harris happened to have made recent inquiries which covered this question, and I have given his figures in Appendix C.

I have met with four methods employed for college admission: First, each university or professional school holds its own entrance examination, independent of every other authority. This is the English plan. Secondly, the Government department holds a simultaneous written examination, which it requires universities and professional schools to accept as an entrance certificate. This is the plan employed in Ontario and New York State. Thirdly, the Government employs inspectors who are associated with the teachers of the school in a final examination, and they, in conjunction with the principal of the school, issue the leaving certificate which universities and technical schools are required to accept. This is the German plan. Fourthly, the university makes a general inspection of respectable high schools who wish to send pupils to it, and thereupon accepts the certificate signed by the principals of such schools, without any examination conducted from itself. This is the plan followed in the majority of American universities, and is known as the American certificate plan.<sup>2</sup>

The last two alone give the teacher what, as a professional man, he has a right to demand, i. e., freedom to work out his curriculum according to his own method and views upon teaching.

If the inspector in Germany, instead of being a civil servant, was, to some extent, under the authority of a professional council, it seems to me that the German plan would be almost perfect.

The American certificate plan presents the obvious danger that pupils may be sent up from some schools without having reached the proper standard of attainment.<sup>3</sup>

(f) Control of courses of study.

24. English secondary teachers, who dread the introduction of State control, are inspired by the fear that it may impose upon our schools fixed courses of instruction similar to that of the primary school code. It is true that such courses, more stringent than any Government code, are already prescribed by the local examination regulations and papers of questions issued from the universities; but this control is not recognized as similar in its effects to that of departmental control, and our English head masters still have left to them a large field of initiative which these examinations do not cover.

The fear, however, that a State authority might centralize, in mechanical fashion, our secondary education is by no means groundless, for there is good reason to believe that those States which have adopted a uniform system of secondary instruction have been in danger of depriving their teachers of freedom and of the progressive spirit; for it is the tendency of a central power to be seeking to stretch its

<sup>1</sup> Question 6 in "Heads of information:" "What proportion of students enter your universities without having previously passed through a secondary school?"

<sup>2</sup> See Catalogue of Michigan University, 1893-94, pp. 44-48.

<sup>3</sup> The universities do something to prevent this result, but the present system is admittedly unsatisfactory; some of the older universities (Harvard among others) have refused to adopt the certificate at all.

authority and to determine fixed modes and forms of instruction, instead of recognizing that the educational aim can be realized in a hundred different ways.

These departments of central control, in New York State, in Ontario, in France, and to some extent even, in Germany, have been led to impose a stringent machinery from the conviction that it was impossible by any other means to check the abuses liable to arise in the schools.

It may be admitted that our secondary schools need the hand of the State to give general direction to their work, but it would be a great disaster if it laid its hand too heavily upon them. It would surely be sufficient if the central authority were to determine in general terms the standard of attainment for pupils when leaving the various types of secondary school. It ought not to be necessary to prescribe any code or detailed curriculum; it may well be left for the local authority, guided by the expert advice of the head master or superintendent, to prescribe a detailed curriculum or syllabus. Only in Ontario has the department gone so far as to prescribe text-books specially prepared under the authority of the department for the use of the schools; and I have gathered that this unfortunate provision is due to the desire for economy rather than from any real belief that the text-books provided by the department are better than other publications.

(g), (h), (i) The distribution of these functions has already been referred to in discussing other matters.

I have now dealt with the various departments of administration as they are regulated by the various controlling authorities recognized in the United States. I have left one question for separate consideration, viz, the professional training of secondary teachers.

#### SECTION IV.—*The professional training of teachers.*

25. In the United States the law forbids any school board to engage a teacher who has not obtained a county or a State certificate; but this certificate does not imply that the teacher has had a professional training, and university graduates intending to teach in high schools obtain the necessary certificates without further question.<sup>1</sup>

It does not, however, follow that because professional training is a voluntary study it is therefore neglected in the United States. On the contrary, the American secondary teacher nowadays is expected to be conversant, superficially at least, with problems of education, and a fair number of teachers have really devoted themselves to the study with interest and zeal.

There are three ways in which a teacher may obtain some instruction in pedagogy:

(1) Many high-school teachers, especially women teachers in charge of the lower forms, have received their general education in city or State normal schools, and along with this have spent some time upon the theory and practice of education. These normal schools have usually a practicing school attached to them, and in the best of them attention is being paid to the development of educational science beyond what is found in our training colleges in England. They, however, suffer from the same hindrance that besets our English primary training colleges—the fact that so many of their students, previously to entering upon the normal course, have received an inadequate general education. Hence, only a small part of the instruction can be devoted to the training in the strict sense of the term, i. e., to theoretical and practical pedagogy. All the normal lecturers whom I met made the same complaint—that it was impossible to give adequate treatment to pedagogy, because the students needed so much help in branches of literature and science which they ought to have completed in a high school.

<sup>1</sup> Outside the States we find in the Province of Ontario regulations which go beyond anything found elsewhere in America. Here there has been established during the last two years a Government department called the school of pedagogy, which must be attended for twelve months by every teacher, whether a graduate or not, who desires an appointment in an Ontario secondary school. (Departmental Regulations, Circular No. 9, 1894, Education Department, Toronto.)

There are just a few normal colleges of high reputation which give great attention to pedagogy. These institutions, like the *Lehrerseminar* in Germany, usually divide their work into two periods, completing the literary and scientific studies in the first years and devoting the attention of their students entirely to pedagogy in the last year or two. This enables them to get a better grasp of educational problems than is possible under the present Government scheme in Great Britain. In later years many of these teachers will have saved enough money to go to a university, where they will continue their academic studies and perhaps receive further professional training in a university department of pedagogy (see next paragraph). Quite a number of high-school teachers, or university men who commenced teaching in a humble way in elementary schools, have only reached the university after the university age. It is much more common in America than in Europe to find undergraduates over 25 years of age.

On the plan of these normal colleges it was proposed recently in Massachusetts<sup>1</sup> to establish a higher normal college especially adapted to the needs of graduates of universities intending to teach in high schools; but the scheme fell through, for it is recognized that it is better to associate all higher studies with the universities than to separate them into isolated institutions.

(2) The study of pedagogy in American universities has received a great impetus during the last ten years, and the majority of men who intend to teach in high schools or to become superintendents are attending pedagogic courses in one or other of the 22 universities which have a professor of pedagogy in the faculty. The latest figures give at least 4,000 students as taking courses in pedagogy. It should be noted that only a small proportion of these 4,000 students are likely to become assistant masters in secondary schools for any length of time. Many will be made inspectors and superintendents, many others lecturers in normal schools. The so-called higher or secondary training will be needed quite as much for Government inspectors, for principals of primary schools, and for lecturers in training colleges as for the rank and file of schoolmasters.

Thus the general principle that the study of education is desirable for a university man who intends to teach is now everywhere admitted. There are still, no doubt, professors in the older universities who have no faith in this novel study, but the university opinion has gone against them.

The chair of pedagogy at Harvard was established some four years ago, and at first, as I have been told, the faculty by no means heartily welcomed the new professor; but this feeling has passed away, and it is seen that the chair can be made of considerable value to the general aims of university work, particularly in matters in which the university comes into relation with the secondary schools.<sup>2</sup>

While, however, the science of education has won recognition as a university study, we find as yet no general agreement as to the best methods by which the study is to be pursued. In the early days, lectures were given on education by a professor in some other branch of study, usually philosophy or theology, but two influences have operated to give a wholly different character to the study in recent years. The excellent pedagogical work produced by the best normal schools, and in recent years the influence of German pedagogics, and particularly the study of the Froebelian and Herbartian systems.

The main difficulty in the pursuit of pedagogy is created by the need for model or practicing schools. In some universities this need is not so much felt, because so many of the students, as I have observed above, have been teachers in earlier years; and in one or two universities the professor's classes are composed of men actually engaged in the high schools of the neighborhood. Thus, in the University of Pennsylvania, at Philadelphia, I found the large classes attending Professor Brombaugh's lectures composed entirely of superintendents, of high-school principals and assistants from the city or the neighborhood.

<sup>1</sup> See Atkinson's *Professional Preparation*, etc. (Appendix F.)

<sup>2</sup> See, e. g., *The School Review*, May, 1894; *University Inspection of Secondary Schools*, and the *Schools Examination Board of Harvard University*, by Prof. P. H. Hanus.

Hence, lecture courses on the theory, the history, and the organization of education comprise the bulk of the work done under the name of pedagogy, and students attending these courses are allowed to count them as one of the subjects for a university degree. It is felt, however, that something more needs to be done, and although as yet no practicing schools have been established similar to the Übung's Schule in the University of Jena,<sup>1</sup> beginnings are made in that direction. At the Leland Stanford Junior University the professor has a model kindergarten under his charge; at Harvard the students are taken to visit schools at Cambridge and Boston, and in the State University of Illinois arrangements were made last year for the equipment of a proper university practicing school. Still more important is the work in research done in the Clark University, in the school of pedagogy, which is a department of the University of the City of New York, and in the Teachers' College attached to Columbia University. This last possesses a well-endowed practicing school, called the Horace Mann School, with kindergarten, primary, and high-school classes. It can not be said, however, that there is as yet any consensus of opinion as to the best mode by which students of education should receive their training in the universities.

In Germany the problem of higher training has been discussed and experimentally treated for the last seventy years, and for the present it has been settled in Prussia by the establishment of the Gymnasial Seminar.<sup>2</sup> In the United States there has been no attempt to accomplish higher training in connection with high schools or academies. Some such method was tried a few years ago in Toronto, Ontario, but has been abandoned in favor of the school of pedagogy now in operation; this last, however, is still in the experimental stage. I can not but think that higher training must be left to evolve itself by experience in a variety of plans, and that the terms of teachers' registration should be regarded as a matter for the control of provincial councils of education.

(3) Perhaps the most important part of the high-school teacher's training is that acquired after he has commenced active work, by means of teachers' meetings and teachers' institutes. The teachers' institute has been for long a recognized and peculiar feature of the American school system. In form the gathering is a voluntary assembly of the teachers of a district; but since the State provides funds to pay the expenses of the gathering, and since the county superintendent makes the arrangements and presides over the gathering, it must be regarded as a part of the public plan of education. I have not been able to attend any of these meetings, but I have heard and read a good deal about them. I should suppose that one half of the work may be described as professional and pedagogic, and the other half as popular and literary in character. These gatherings are attended by teachers of all grades, and, while some of the discussions are on topics common to all, for other subjects the institute breaks up into sections, one section for high-school matters, another for primary school matters. The institutes last usually for one or two days; sometimes a whole week will be taken for the purpose out of a vacation.

Of a similar character to these teachers' institutes are the gatherings of superintendents and lay members of school committees, which are held in Massachusetts, and probably in other States also. There must, indeed, be some enthusiasm for the work of education, when lay members of school boards can be found willing to join with teachers and inspectors in the formal discussion of the duties of their office.<sup>3</sup>

<sup>1</sup>I have referred in detail to the Gymnasial Seminar and to Professor Rein's work at Jena in the account I have written for the commission on the training of teachers in Germany.

<sup>2</sup>See note 3 on previous page.

<sup>3</sup>Report of Board of Education, Massachusetts, pp. 82-86. In Ontario there is also an annual gathering of trustees in connection with the Ontario Educational Association—a trustees' department constitutes one of the sections of this association. More than 100 trustees representing school boards throughout the Province meet at the Easter convention.—(See Report of Minister of Education for 1892, p. 111.)

Apart from the teachers' institutes which are organized by public authority, are the numerous summer schools, which have no connection with the State or the county. Originally the summer schools were gatherings, like the Chautauqua Assembly, for general study and literature and science; but as the interest in pedagogy has increased, it has found a place in the time-table of nearly all the important summer schools. It is in these schools that the high-school graduates who have had no previous training gain most of their acquaintance with pedagogy, an acquaintance, no doubt, superficial, but in this, as in other branches of study, the student is shown the first steps in a course which he may afterwards follow out in private reading and inquiry. If I may venture, after so short a visit, to report a general impression, I should say that pedagogy is likely to suffer from the same evil that besets all higher studies in America, the lack of a thorough, steady devotion by students for a long period of time. The nervous unrest which seems to characterize American life as a whole tells with fatal effect upon studies which, in their nature, require prolonged application and investigation in order to produce effective results.

#### SECTION V.—*Instruction in religion and in citizenship.*

26. Since an inquiry into the nature of the secondary-school curriculum is excluded from this report, I have paid no attention to such matters beyond what has been required in order to discuss the different types of high schools. It is necessary, however, to refer briefly to two branches in the curriculum, to instruction in religion and in citizenship, because of their relation to the forces that control the course of public education.

The theory of education recognizes three sources of authority over the child, which have claimed and do still claim to control its education: the family, the church, and the state; and in the curriculum the influence of the church is recognized in the demand for religious instruction, that of the state for instruction in citizenship. Now, if we look back to the beginnings of American education, we see how in the early days the child's education was associated with the authority and guidance of the church, but as in course of time the church changed in character from a single authority, supported by the state and compelling obedience, to a variety of voluntary associations, the school became separated from the church, and the state exercised its influence without the ecclesiastical association. We find this change represented in the curriculum by the substitution of religious instruction by instruction in citizenship. In Germany, where the state and the church are still associated in their authority over the school, both religious instruction and citizenship take a prominent place.

The question that first arises in contemplating this situation will be: "Are the American schools to be described as godless or irreligious because definite religious instruction has been for so long abandoned?" I venture to think that such an epithet would be unjustified. In the old days the schools were not unpatriotic because they lacked instruction in citizenship, and to-day the American school is not, as a rule, irreligious, although lessons in religion are excluded.

The error arises from the mistaken supposition that the school either can or should provide for all the spiritual and mental needs of the child, and that the child's life will suffer unless every human interest is distinctly incorporated in a course of study. On this supposition lessons on teetotalism and alcohol have been introduced into the American curriculum, from the desire to train up a community in abhorrence of strong drink.<sup>1</sup> The end is laudable, and the prohibition party in politics is satisfied with this addition to the course of study; those, however, who attempt to promote temperance by such means disregard the nature of the child's mind and means by which the character of the young is trained. The aims of temperance can indeed be promoted by teachers who are themselves temperate, and who have studied the conditions under which the growing child learns to control appetite and passion.

<sup>1</sup> See, e. g., Report of Education Department in Ontario, pp. xvi, xvii.

Such teachers will train up the young to avoid excess in drink, although the topic may never be mentioned within the school walls. If, as is the case at present in parts of America, a vehement popular movement leads the people to insist upon positive instruction in such a subject, the result may be beneficial if the teachers themselves are in earnest about the matter; but such instruction is by no means essential to the aim which the people have in view, and in the hands of inefficient or insincere teachers not only waste of time but positive moral harm will result.

Now, without for a moment suggesting that the problem of religious instruction stands on a level with the problem of training in temperance, it would appear that the same pedagogic principles are involved. If we compare the American secondary school with the German secondary school, we find that in the latter formal biblical instruction is given the greatest prominence, while in the former it is absent, and yet no one will urge that the American people, either in youth or age, are less religious or devout than the Germans.

The Americans have chosen to consider that religious instruction can be undertaken apart from the school, but by so doing they have not made either teacher or school godless and irreligious.<sup>1</sup> It is true that the American child fails to learn as much as it should of the Bible story, and this is a matter to be regretted, not only on religious grounds, but for the sake of general culture. The Sunday school is never able to supply the place of steady school instruction in biblical knowledge. This American teachers themselves regret, but they would protest still more if the introduction of religious instruction into the schools was to lead to a revival of the bitter sectarian strifes which are found in England and elsewhere. The American teacher further points out that, while this regular instruction in biblical knowledge is wanting, his schools do much to help the child toward religion; for the teachers themselves are, as a rule, serious, religious persons. They conduct the opening exercises of the school with reverence, and the children learn in this daily assembly the habits of reverence and prayer. If these habits are, as they should be, fostered also in the home and in the church by parents and by pastor, the child is as safe as he is likely to be in a school which is founded to serve the ends of a religious denomination.

There are, in fact, four different educational aims included under the general phrase "religious instruction," and any fruitful discussion of the subject should keep them apart. Such instruction may (1) train the child in habits of reverential worship; (2) impart positive knowledge in the facts of the Bible story; (3) impart dogmatic instruction in the creed of church to which the child belongs; (4) direct the child's intelligence to an appreciation of the fundamental ideas of Christian morality as exemplified in the character of the great heroes of Bible story and of the national religious history.

All this can be done by the school so as to satisfy the demands of the most exacting churchman, and yet the root of the matter may not be attained, and no school<sup>2</sup> can pretend to reach the personal hidden life of the child—if, indeed, it has a right to venture there.

Now the American school excludes (2) and (3), but it need not exclude (1). The "opening exercises" may be of such a character as to train the corporate society of the school, assembled morning by morning, in the habit of reverence and prayer. If the family and the church do their share, this will count for much in the child's life.

In excluding positive Bible knowledge (2), the American school undoubtedly suffers, and its teachers admit this. Regarded merely as a part of general culture, the children lose by being left in ignorance of the contents of the Bible. In exclud-

<sup>1</sup>For an excellent exposition of the American standpoint, see Bureau of Education Report, 1888-89, Decision of judges in State of Wisconsin.

<sup>2</sup>The case of the boarding school is somewhat different. The teacher in a boarding school undertakes entire responsibility in loco parentis for the child's life. But no national system of education can undertake so great a responsibility,

ing dogmatic instruction (3), the American school is doing precisely what is done in the great majority of secondary schools in England.

Fortunately, no school law can either compel or hinder a faithful teacher from imbuing his whole school life and influence with Christian ethics that shall make for righteousness, if he himself is indeed a teacher realizing, to use Arnold's phrase, that "moral thoughtfulness" is the one final aim of the school. So far as the American school system, by excluding religion, has tended to diminish the moral responsibility of the teacher, it has been at fault. It is not for an outsider to judge hastily whether this has been the result or not, but there is no reason in the nature of things why this should be the case.

The above has been the general tone which I have found prevalent among both teachers and Christian ministers whom I have met in the United States, and on consulting Bishop Fraser's report I find that he gained a similar impression in the close observation that he made of American schools twenty years ago:

"I confess to the conviction growing more and more in my own mind, strengthened by what I have heard and seen in America, that what we need more of in England is *intelligent* education, a real quickening of the minds of the people, and I say this quite as much in the interests of religion as in the prospect of political changes. The results of this inquiry would make me much less hostile to a proposition for merely secular education if such were inevitable (which I am far from thinking it is) than I should have been ten years ago, when it would have simply shocked me. I should not shrink from still taking what I conceive to be my proper place as a clergyman in relation to the school, even under a system of secular education. I should neither despair of Christianity nor morality." (Fraser's Report, pp. 323-4.)

27. But since the publication of this report we have had in England<sup>1</sup> an experience which is more valuable than anything which the United States has to offer us, the successful endeavor to provide an "unsectarian religious instruction." This phrase has been used mainly in connection with our English primary schools, but it might also be fairly used to describe the weekly lesson in biblical knowledge, combined with the hymn and prayer at the opening of the school day, which are an essential part of school life in the majority of English secondary schools. Again and again, in talking on this subject with American teachers, they have expressed to me their admiration of this plan, and of their regret that the conditions of the American school system forbid them to adopt a similar plan in the United States.

"England seems to be wedded to religious instruction, requires it in her public elementary schools by the wishes of the great majority of her people, and perhaps an equal majority desires or is willing that this should be on a Christian basis.

"In Pennsylvania, in seven-eighths of the public schools, the Bible is read by the teacher without comment, and this usually constitutes the sum of the religious instruction given. In many States this is omitted, and the tendencies are more and more to bring our schools to the condition of the French, where every form of religious instruction is jealously excluded. The logic of our position, which implies the absolute separation of church and state, is rapidly driving us to this place. We must apply the same principles to Catholics, Jews, and unbelievers we do to Protestant sects if in any locality they demand it. We can not, consistently with our general theory, levy taxes to force teaching down children's throats against which their consciences protest, and while I believe it is a good thing to give even the weak ideas of religion usually gained by an unexplained reading of the New Testament, and would hold on to it as long as I could, I should give it up in the face of any serious and respectable protest if we are to maintain our present theory of public schools.

"And yet this is to my mind not a satisfactory result to come to. The American nation needs more rather than less religious instruction. The formal reading of the

<sup>1</sup> The Protestant school system of Canada has also successfully employed unsectarian religious instruction for many years.

Bible is often a lifeless form. The children do not know the subject read about. One word of explanation is often worth the whole chapter read. The home, the church, and the Sunday school combined do not give nearly sufficient to many children, none at all to many others, and if we are to rule it out of the schools absolutely we will also rule it largely out of the life of the nation. Also, while natural ethics may be taught and be effective, it is not so pointedly taught as when reinforced by the religious sanction. Hence I do not believe that the absolute secularization of the schools can be permanently satisfactory except in so far as the nation lowers its standards, and I would be glad to find some compromise, if you will call it so, by which the great majority of the people of any school district could have definite, positive teaching of such a general sort as they might approve, not sectarian, with such an arrangement of hours as not to force the attendance of the minority of conscientious opposers. Even unbelievers are often glad, or at least willing, to have definite religious and moral ideas taught their children, and it hardly seems to me worth while for the great mass of the people, especially those of Anglo-Saxon descent, inheriting the religious tendencies of the race, to witness their own growth in religious indifference for the sake of a theory, if an equally satisfactory result for the rest of the nation can be secured by another arrangement.

"If in a district of 100 families, 95 desire and would be greatly profited by the infusion of general religious truth, and can not get it except through the schools, why not excuse the 5 from attendance and give it." (President Sharpless in *The Relation*, etc.)

At present, in America, the fundamental laws of the States forbid the introduction of even "unsectarian religious instruction" into the public schools; they do not forbid it in England, and I am convinced that the immense majority of parents who send children to English secondary schools will be prepared to trust our secondary teachers with this important part of their duty, as they would in America if the way were open.

The whole question depends upon this issue, whether the people themselves accept and desire an unsectarian religious instruction, or whether they are so devoted to church forms as to be alienated from an education in which their own church is not represented. Now, this attitude has only been taken up in America by the people of one great church. The Roman Catholic tradition in education dates back to a time when the church and the schools were one, and the Roman Catholic Church will never recede from such a position.<sup>1</sup> Hence it is admitted that in the United States a certain amount of injustice is done to that section of the Roman Catholic population whose conscience keeps them from sending their children to the public schools;<sup>2</sup> but the total number of such parents is relatively very small, and any attempt to remedy the injustice would raise such strife that no serious attempt is likely to be made to heal the trouble.<sup>3</sup>

And this "injustice" is after all not so monstrous as it is sometimes represented.

<sup>1</sup> And it must be observed that the Roman Catholics only plead for "separate schools" for young children. They have no objection to sending their boys and girls to be taught with heretics in the high schools. They definitely declare that they do not desire to keep their children away from the high schools; so long as they can influence the young mind up to 12 years of age they are satisfied.

<sup>2</sup> It is only a certain section, even of the Roman Catholic population, who feel this injustice, and who desire to keep their children separate from the rest of the population. In Ontario, at the last census, out of 90,000 Roman Catholic children, only 30,000 were in separate schools, although the Dominion law gives them the right, which is desired by some in England, of claiming both local rates and State aid for separate schools. I have no figures—probably none are to be had—for the United States, but I am told that the more liberal minded among the Roman Catholics support the public school system.

<sup>3</sup> Besides the Roman Catholics there are, in one or two districts of the West, colonies of Lutheran Germans alien to the American Commonwealth alike in language and religion. Here also the injustice is felt, but the injustice would be still greater to the State, as a whole, if these colonies were allowed to establish themselves as an alien population, apart from the rest of their State in blood and in speech.

The principle on which the State acts in supplying education at public cost is precisely the same as that on which it supplies free libraries or parks—it is a provision for the general good of the community, which any individual may use or decline to use as he pleases; he is taxed in support of this provision not, in the first instance, because he is a parent, but because he is a citizen. He may, from various motives (religious or other), prefer to patronize private schools or private libraries—and he can not on that account complain of having to pay twice over for these matters; when once the community has determined that its welfare depends upon adopting public provision for education and culture, it is idle for malcontents to complain of injustice; their only resource is to attack the socialistic basis on which the community is acting. Now, in America, this attack can not possibly succeed, because the belief in public education as a part of civic duty is so firmly implanted; the Roman Catholics in certain parts of America have, therefore, hoped, like a certain section of “the Church” party in England, to secure a share of the public taxes. But their hope is vain; for the public taxes are raised for public purposes, not for the encouragement of private enterprises, even though these enterprises have high religious aims.

The injustice, however, is felt and can not be denied in the case of Roman Catholic parents who are poor and who can not establish private schools suited to their religious opinions; the remedy, such as it is, can only be found in the zeal of the Roman Catholic community, whose wealthier members enable the clergy and the sisterhoods to maintain parochial schools. The upholders of the public schools usually admit and regret this injustice to the poorer section of the Roman Catholics, but they see no means of remedy which would not be worse than the disease; for they can not permit public money raised solely for the purposes of education to be expended by clergy who are devoted, not to education, but to religious propagandism.

In Canada, by the original Statutes of the Confederation, the Catholics have obtained the right to establish State-aided separate schools, and, in consequence, the politics of Canada have never been free from bitter sectarian strife.

Since the example of Canada is being quoted just now in England, it should be understood that the separate-school system is permitted only in consequence of terms laid down to appease the Roman Catholics, when the Dominion was first created. The Episcopalians in Canada very seldom approve of the plan. (See Appendix D.)

It may, perhaps, be right in special cases, such as parts of Canada and the United States present, to permit a Roman Catholic population to establish an independent system of schools; but it would be most unfortunate and illogical to adduce the example of America as a guide to us in England, where the conditions are wholly different.

Hence, I conclude, in view of the possibility of secondary schools being established in England under public control, that the experience of America would urge us to give no support to institutions which are founded in the first instance to serve a denominational purpose. And it would also point to the wisdom of permitting the parents in each locality to decide whether they will prefer their children to receive unsectarian religious instruction, and, what is of more importance, the silent training in habits of reverence and worship obtained by the assembly of the school for simple worship at the beginning of the school day. If, however, such an arrangement leads to strife, it would be wiser to end the controversy by excluding religious instruction entirely from the school, leaving it, as in America, to the family and the church.

28. The responsibility of the school with regard to training in citizenship is now for the first time being discussed in England, and I refer to it here because it seems clear that the assumption by the State to complete authority over the school leads directly to the demand by the State that the teacher shall train his children in patriotism.

In the hands of a wise teacher, who sincerely cares for the welfare of his country,

such instruction may be invaluable, and I believe that in Germany it has proved a distinct aid in the development of true citizenship. But here again it is important to distinguish aims and methods. The school can attempt—

(1) To give positive knowledge in national history, which shall serve as a basis for interest in the national welfare in later years.

(2) To give formal lessons in civics, i. e., in the facts relating to local and imperial government.

(3) To assist children to realize their relation to their country by seizing hold of the opportunity presented by great national events and days, celebrating them appropriately and explaining their significance.

(4) By so organizing the corporate life of a school society (mainly outside of the class room) as to develop in a child the habits and ideas of esprit de corps, of public spirit and devotion to the common interests of the society; thus the children are prepared in the microcosm of the school to play a greater part hereafter in the civic community.

Now, of these four methods, the last has been employed most successfully in English "public schools" (I use the term in our English sense). Perhaps the most distinctive contribution to pedagogy which England can offer is the methods of discipline and training exhibited in good English boarding schools. The second is almost unknown in England or Germany, but forms a distinct part of the curriculum in French and in many American schools. I very much question its value for the purpose in view, for it is a question whether the body of facts relating to local government are suitable for children to understand; at any rate, they would need very careful handling in order to prove of real educational value. We have here the same danger of error that is seen in those who advocate formal instruction in temperance and hygiene, or in dogmatic Christianity; the intention is worthy, but the means are not likely to achieve the end in view; the lessons on these subjects will not be long remembered unless they are really suitable to the child's understanding and adapted to his present mental needs and interests.

The third method is employed in Germany with excellent success, as I have often witnessed, by teachers who are themselves patriotic, and understand how to touch the imagination and the hearts of children. I am told that in America such celebrations are also valued in the schools; but if a tree is known by its fruit, one can not take a high estimate of the civic instruction imparted by American teachers. The same rule must apply here as in every branch of instruction—the teaching depends upon the teacher—he who teaches patriotism out of a book, according to the order of a school board, without himself feeling the right motive and interest, will do harm to his children. \* \* \*

I believe that all four methods, if employed with judgment and by teachers of experience, will help children to realize their duty and their privileges toward their mother country. It is evidently the State's concern to labor for the production of such a result; and it will be achieved, not by the publication of text-books—though these may help the cause—but by training an army of teachers who will understand their responsibility in this and in all matters which concern the character and the conduct of English children while under instruction.

I have, etc.,

J. J. FINDLAY,  
*Assistant Commissioner.*

TORONTO, November 5, 1894.

## APPENDIX A.

## SET OF DOCUMENTS EMPLOYED BY THE REGENTS OF THE UNIVERSITY OF THE STATE OF NEW YORK IN INSPECTING AND AWARDING GRANTS TO SECONDARY SCHOOLS.

## I.

## ANNUAL REPORT FOR 189 -9 OF ———.

*To the Regents of the University of the State of New York.*

[Laws of 1892, ch. 378, section 25.]

§ 25. The regents or their committees or officers shall visit, examine into, and inspect the condition and operations of every institution and department in the university, and require of each an annual report verified by the oath of its presiding officer, and giving information concerning trustees, faculty, students, instruction, equipment, methods, and operations, with such other information and in such form as may be prescribed by the regents, who shall annually report to the legislature the condition of the university and of each of its institutions and departments, with any further information or recommendations which they shall deem it desirable to submit to the legislature; and such parts of their report as they shall deem necessary for use in advance of the annual volume may be printed by the State printer as bulletins. For refusal or continued neglect on the part of any institution in the university to make the report required by this section, or for violation of any law, the regents may suspend the charter or any of the rights and privileges of such institution.

## REGENTS' ORDINANCES AS TO ANNUAL REPORT.

Every institution of the university shall transmit its annual report to the regents before September 1 each year. On September 1 of each year the secretary shall report to the executive committee any institution of the university whose annual report for the academic year ending July 31 is not filed in the regents' office.

[Read these instructions carefully before filling this blank.]

1. Use perfectly legible figures, not words, for all dates, amounts, numbers, etc.  
2. When the report makes two items of something which your records combine, e.g., room rent and board, estimate as nearly as possible the division between the two; for if you merely bracket the items and give the total, it distorts both columns in the summary for the whole State.

3. When questions do not apply or can not be answered definitely, do not leave a blank, but make clear by the following marks that answers are intentionally, not accidentally, omitted:

— drawn through heading means "does not exist in this institution."

O in place of answer means "none this year." ? in place of answer means "fact unknown."

? preceding an answer means "probably" or "approximately"; e.g., ? 324 means "to the best of our knowledge and belief, about 324."

4. Change any term used so that the report shall read exactly according to facts; e.g., write "chairman" instead of "president," "first-year" class instead of "freshman," etc.

5. If there is insufficient space for any part of the report, complete it on the sheets of uniform size sent herewith and insert in proper place. This size must be used for binding.

6. For the comparative tables all reports should cover exactly the same academic year; but if it is not practicable to give the facts for July 31, institutions may give them for their own date, clearly indicating the change whenever July 31 is printed in this blank.

7. "Trustees," as used in this report, means the governing body, by whatever name known.

8. Reference to any item must be made by the number of the head under which that item is given.

#### UNIVERSITY OF THE STATE OF NEW YORK.

The trustees of ——— make the following report to the regents of the university for the year ending July 31, 189—:

Days actually in session during past year ———.

#### 1. TRUSTEES.

*Officers, August 1, 189—.*

President, ———.  
Treasurer, ———.  
Secretary, ———.

*Changes in trustees.*

*Vacancies occurring between August 1, 189—, and August 1, 189—.*

| Name. | Cause.<br>[Write "Term expired," "Died," "Resigned," or "Seat declared vacant," as case may be.] | Date. |
|-------|--|-------|
|       |  |       |

*Appointments made between August 1, 189—, and August 1, 189—.*

| Name, with academic degrees, and where obtained. | Residence. | Date. |
|--|------------|-------|
|  |            |       |

Number in full board of trustees ———. Number of present vacancies ———.

#### 2. FACULTY.

*Officers, August 1, 189—.*

Cancel any title not used, and add any not given that are used.

Principal, ———.  
Vice-principal, ———.  
Preceptress, ———.  
Secretary, ———.

There are — men and — women on the academic faculty. — men and — women are teaching as a permanent profession, and — men and — women are teaching temporarily.

Changes in faculty include each instructor, even if he has no vote in faculty meeting.

*Vacancies occurring between August 1, 189—, and August 1, 189—.*

| Name. | Cause.<br>[Write "Term expired," "Died," "Resigned," or "Seat declared vacant," as case may be.] | Date. |
|-------|--|-------|
|       |  |       |

*Appointments made between August 1, 189—, and August 1, 189—.*

| Name, with academic degrees and where obtained. (a) | Subjects taught. | Years spent in teaching. | Date of election to present position. |
|---|------------------|--------------------------|---------------------------------------|
|   |                  |                          |                                       |

*a* Give for those who do not hold any academic degree the institution where their education was completed.

## 3. STUDENTS.

*Number and classification of students taking academic studies during past year.*

|            | Total for year.   |  |  | By term.                                    |              |             |              |          | By residence.                             |        |        |          |
|------------|---|--|--|---|--------------|-------------|--------------|----------|---|--------|--------|----------|
|            | Pupils not holding preliminary or 30-count certificates, but taking higher studies other than physiology and drawing. | Academic holding regents'—                     |  | Students attending one week or more during— |              |             |              |          | Different individuals during entire year. |        |        |          |
|            |   | Preliminary of 30 count certificates. <i>a</i> | 50-count or higher diplomas or certificates. | First term.                                 | Second term. | Third term. | Fourth term. | Average. | Boarders. ( <i>b</i> )                    |        |        |          |
|            |   |  |  |   |              |             |              |          | Day scholars.                             | Local. | State. | Foreign. |
| Boys.....  |   |  |  |   |              |             |              |          |   |        |        |          |
| Girls..... |   |  |  |   |              |             |              |          |   |        |        |          |
| Total.     |   |  |  |   |              |             |              |          |   |        |        |          |

*a* Put in this column only those who hold a preliminary or 30-count certificate, but have not yet gained a 50-count regent's diploma or certificate.

*b* "Boarders" means those who leave their homes and board in or near the school. Count as "local" all who live near enough to go home over Sunday. All others from this State count as "State," and from all other States or countries count as "foreign."

Not to be filled by academic } This academy has also instructed in subacademic studies — boys  
departments of union schools. } and — girls, none of whom are included in the above statistics.

*College entrance.*

Entered college past year:

Boys *a* .....

Girls .....

Expecting to enter coming year:

Boys .....

Girls .....

## 9. RECEIPTS DURING PAST YEAR.

|  |    |  |
|--|----|--|
| Tuition fees .....   | \$ |  |
| Fees for teachers <i>b</i> .....   |    |  |
| Room rent .....  |    |  |
| Board .....  |    |  |
| Other receipts from students .....   |    |  |
| Income of investments .....  |    |  |
| Gifts and bequests .....   |    |  |
| Regents' grant for credentials and attendance .....                                    |    |  |
| Regents' grant for books and apparatus .....   |    |  |
| Raised by trustees for books and apparatus .....                                       |    |  |
| Department of public instruction grant for instruction of common school teachers ..... |    |  |
| All other sources .....  |    |  |
| Total .....  |    |  |

*a* Include not only members of last class, but also any former pupil who actually entered college during past year.

*b* See footnote (*a*) on p. 662.

10. EXPENDITURES DURING PAST YEAR.

|  |    |  |
|--|----|--|
| Additions, improvements, and repairs as follows: |    |  |
| 1. Grounds .....                                 | \$ |  |
| 2. Buildings .....                               |    |  |
| 3. Furniture .....                               |    |  |
| 4. Apparatus .....                               |    |  |
| 5. Library .....                                 |    |  |
| 6. Museum .....                                  |    |  |
| Salaries for instruction .....                   |    |  |
| Fees to teachers <i>a</i> .....                  |    |  |
| Salaries paid other officers and employees ..... |    |  |
| Prizes, scholarships, etc .....                  |    |  |
| Given or lent to ——— students .....              |    |  |
| Interest on debt .....                           |    |  |
| Insurance .....                                  |    |  |
| Fuel and lights .....                            |    |  |
| Printing, postage, and stationery .....          |    |  |
| All other purposes .....                         |    |  |
| Total .....                                      |    |  |

*a* Fees from students to teachers for regular instruction are to be counted as a receipt and expenditure, even if they do not pass through the school treasury. This table should show the total amount paid by students to the school or its faculty for instruction.

10a. CERTIFICATE OF AUDITING COMMITTEE.

We hereby certify that we were duly appointed by the trustees as auditing committee and that we have examined in detail the preceding statement of receipts and expenditures. We find proper vouchers for all the items and believe each payment to have been for a proper purpose and of a reasonable amount.

\_\_\_\_\_,  
\_\_\_\_\_,  
*Auditing Committee.*

The committee must fill the above blank and each member must sign both original report and duplicate.

11. ADDITIONAL INFORMATION.

Here insert statements regarding changes in organization, brief descriptions of new buildings, increased facilities for instruction, and any benefactions announced but not received, with names of givers and amount, object and conditions of each gift, together with any other information to be included in the summary of the progress of each school as printed in the regents' report to the legislature.

12. AFFIDAVIT OF PRESIDING OFFICER.

By the laws of 1892, ch. 373, sec. 25, the annual report of every institution must be "verified by the oath of its presiding officer," which term may mean either the president of the institution or the chairman of its trustees. It is very desirable that the report be read and approved by the trustees, but if this can not be done in time to send the report to the regents before September 1, it should be sent as soon as authenticated by the presiding officer, and read to the trustees afterwards.

STATE OF NEW YORK, county of \_\_\_\_\_ ss:

\_\_\_\_\_, in said county, being duly sworn, deposes and says that he is the presiding officer of \_\_\_\_\_; that the foregoing report has been prepared in accordance with the instructions of the regents of the University, and that the statements therein he verily believes to be in all respects true, and that an exact copy of this report has been filed with the permanent records of the institution.

\_\_\_\_\_,  
*President of \_\_\_\_\_.*

Subscribed and sworn before me \_\_\_\_\_, 189—.

## II.

## UNIVERSITY OF THE STATE OF NEW YORK.

*Principal's schedule to accompany the trustees' report of ——— for the year ending July 31, 1893.*

AFFIDAVIT. *a*

STATE OF NEW YORK, *county of ——— ss:*

———, of ———, in said county, being duly sworn, deposes and says that he was principal of ——— during the academic year ending July 31, 1893, and that all entries made in the following schedule as to names, ages, times, and places of completing regent's preliminary examinations, periods of attendance, subjects taught with the total number of exercises in each, text-books used and parts studied, are true to the best of his knowledge and belief.

Subscribed and sworn before me ———, 1893.

———, *Principal.*

———  
*Notary Public.*  
*Justice of the Peace.*

(Cancel one title.)

## DIRECTIONS.

1. No scholar can be included in this schedule who has not, during the year ending July 31, 1893, attended the regular school exercises one day or more after having passed all the preliminary examinations, or after having gained a 30-count certificate.

2. Make a strictly alphabetic list of all boys, followed by a similar list of all girls, entitled to be included in this schedule. Number all the names as a single list. Additional sheets will be sent if needed.

3. To fill the "summary of instruction:"

(a) Give for the grammar of each language the facts for the edition most used in your school for the entire course, and not for first year only.

(b) Give for "total exercises" the product obtained by multiplying the number of exercises actually given per week on each subject by the number of weeks during which that subject was taught. Indicate by O every case where no instruction was given.

(c) Under head "text-books used" give author, or, in case of texts, editor, not publisher.

(d) Under "other subjects" put all, not in the printed list, in which instruction was given during past year.

(e) If more than one class has pursued the same subject, enter each additional class under "additional classes."

*Principal's schedule of the ——— for 1892-93.*

| No.     | Names of academic students.<br>[Give Christian name in full.] | Age at nearest birthday. | Month and year when preliminary examinations were completed, with name of school if completed elsewhere. | Total days' attendance as an academic student in this school during past year. |
|---------|---|--------------------------|--|--|
| 1       |   |                          |  |  |
| 2       |   |                          |  |  |
| 3, etc. |   |                          |  |  |

*a* In any extraordinary necessity, e. g., the death of the principal, this schedule may be prepared and the affidavit executed by a teacher or trustee. In such case, state the cause in special affidavit, and also the sources from which a knowledge of the facts herein is derived. If there have been two or more principals during the year, each should make affidavit relative to his own part of the schedule.

*Summary of instruction actually given in past school year.*

| Subjects.  | Total exercises. | Text-books used.  |                | Pages of text-books studied. |              |             |              |
|--|------------------|-------------------|----------------|------------------------------|--------------|-------------|--------------|
|  |                  | Author or editor. | Title of book. | First term.                  | Second term. | Third term. | Fourth term. |
| Group 1.   |                  |                   |                |                              |              |             |              |
| 1. Reading .....                                   |                  |                   |                |                              |              |             |              |
| 2. Writing .....                                   |                  |                   |                |                              |              |             |              |
| 3. Spelling .....                                  |                  |                   |                |                              |              |             |              |
| 4. English, elementary .....                       |                  |                   |                |                              |              |             |              |
| 4a. English, advanced .....                        |                  |                   |                |                              |              |             |              |

| Other subjects a .....                             |                  |                   |                |                              |              |             |              |
| Additional classes in subjects printed above ..... |                  |                   |                |                              |              |             |              |

a Including any of the special courses in literature mentioned in Supplement 2 of the Academic Syllabus.

## III.

## UNIVERSITY OF THE STATE OF NEW YORK.

*Report on ——— by ——— ———, Inspector.*

## PURPOSES OF INSPECTION.

To ascertain whether the institution is provided with suitable grounds, buildings, equipment, and teaching force.

To ascertain if the work done is creditable in quality and scope.

To aid in correcting observed defects by friendly criticism and suggestion.

To enable each school to profit by the experience of others whose methods have been found most successful.

To secure from the teachers suggestions which may be of service to the university in its aim to keep in sympathetic touch with all its institutions.

Date and duration of visit ———.

Exercises attended ———.

## 1. Grounds:

- a. Location.
- b. Extent.
- c. Condition as to—  
Drainage.  
Shade.  
Shrubs and plants.
- d. Cared for by whom.
- e. Flag staff pole.

## 2. Buildings:

- a. Number and size—  
Wood.  
Stone.  
Brick.
- b. Special features—  
Dormitory.  
Auditorium or chapel.  
Gymnasium.  
Laboratory.
- c. Closets.
- d. Academic rooms (for floor plans and dimensions see page —).  
Study hall.  
Class rooms.  
Number of sittings.  
Cubic feet per pupil.  
Floor space per pupil.  
Light.  
System of heating.  
System of ventilation.  
Furniture.  
Decorations—  
Plants.  
Busts.  
Maps.  
Pictures.  
Statuary.  
Charts.

## 3. Library:

- a. Where kept.
- b. Condition.
- c. Number volumes.
- d. Periodicals now taken.
- e. Total value.
- f. Class of books—  
General.  
Philosophy.  
Religion.  
Sociology—  
Economics.  
Education.  
Government documents.

## 3. Library—Continued.

- f. Class of books—Cont'd.  
Philology.  
Science.  
Useful arts.  
Fine arts.  
Literature—  
Poetry.  
Fiction.  
Prose.  
History.  
Geography and travels.  
Biography.  
Text-books.
- g. Provisions for additions.
- h. System of classifying and cataloguing.
- i. When open.
- j. Number of books drawn.
- k. Character of books drawn.
- l. Courses of reading planned for pupils.
- m. Public library; to what extent patronized by pupils.
- n. Effort made to encourage pupils to form private libraries.
- o. Bulletins from regents' office—  
Where kept.  
Missing numbers.

## 4. Apparatus:

- a. Where kept.
- b. Condition.
- c. Value.
- d. Character.
- e. Maps, charts, globes.
- f. Facilities for individual work by pupils.
- g. Services of inspector of apparatus not needed.

## 5. Teachers:

- a. Principal—  
Where educated.  
Taught how long.  
Salary.
- b. Teachers doing academic work—  
Men.  
Women.
- c. Required qualifications.

## 5. Teachers—Continued.

- d. Faculty meetings—  
Held how often.  
Character.

## 6. Pupils:

- a. Population of district.
- b. Children of school age.  
1. Total attendance in all grades.  
2. In academic department.
- 3. Holding preliminary certificate.
- c. Requirements for entrance to academic department.
- d. Requirement for graduating.  
1. Academic or classical diploma.  
2. Count certificate.
- 3. Standard adopted by board of education without reference to regents' credentials.

e. Number that enter college.

f. Number that enter professional life.

g. Success of graduates in after schools.

## 7. Courses of study:

- a. Time given to English.
- b. Status of Greek.
- c. Status of Latin.
- d.
- e. Number recitations per week.
- f. Provisions for physical training.

## 8. Student organizations:

- a. Literary.
- b. Social.
- c. Athletics.

## 9. Opinions of teachers:

- a. Examinations.
- b. Syllabus.
- c. Suggestions.

## 10. General remarks:

- a. Discipline.
- b. Character of work done.

## APPENDIX E.

SET OF DOCUMENTS FROM THE OFFICE OF THE EDUCATION DEPARTMENT,  
TORONTO, RELATING TO THE INSPECTION OF HIGH SCHOOLS AND COLLEGI-  
ATE INSTITUTES.

## I.

TORONTO, ———, 189—.

DEAR SIR: In order to facilitate the inspection of your school, be so kind as to fill in at your earliest convenience the inclosed forms and to have ready for inspection the drawing books and bookkeeping sets presented at the last primary examination and the catalogue of the library, apparatus, maps, and gymnasium equipment. Please, also, have ready for my use a copy of the time-table of each teacher and a special copy of your general time-table, showing the work of each form.

I propose to pay my annual visit of inspection during the current half year; and as I am directed to report on the ordinary condition of your school, I shall feel obliged by your notifying me immediately to the above address should anything be likely to interfere, before inspection, with your usual routine.

Yours, truly,

—————,  
*High-school Inspector.*

PRINCIPAL HIGH SCHOOL (or Collegiate Institute).

## II.

[To be filled in by the principal on receipt and retained by him until the inspector's visit.]

*High-school inspector's annual report, 189—.*

HIGH SCHOOL OR COLLEGIATE INSTITUTE AT ———.

## I. Staff.

| Names of teachers. | Qualifications. (a) | High and public school experience. (b) | Date of appointment. | Salary. | Subjects taught. [To be fully detailed.] |
|--------------------|---------------------|--|----------------------|---------|--|
|                    | { (1) .....         |  |                      |         |  |
|                    | { (2) .....         |  |                      |         |  |
|                    | { (1) .....         |  |                      |         |  |
|                    | { (2) .....         |  |                      |         |  |

a Give (1) nonprofessional standing [in the case of university men, name the university]; and (2) date of professional certificate, indicating whether ordinary or specialists.

b State separately.

II. University standing, in honors, (a) of teachers appointed since last inspection.

## III. Attendance.

[Statement to be based upon the attendance for the current half year.]

|  | Form I. | Form II. (b) | Form III. | Form IV. |
|--|---------|--------------|-----------|----------|
| 1. English department.....               |         |              |           |          |
| 2. Mathematical.....                     |         |              |           |          |
| 3. Chemistry .....                       |         |              |           |          |
| 4. Science option .....                  |         |              |           |          |
| 5. Latin .....                           |         |              |           |          |
| 6. Greek.....                            |         |              |           |          |
| 7. French.....                           |         |              |           |          |
| 8. German.....                           |         |              |           |          |
| 9. Commercial.....                       |         |              |           |          |
| 10. Vocal music .....                    |         |              |           |          |
| 11. Drawing.....                         |         |              |           |          |
| 12. Drill, calisthenics, gymnastics..... |         |              |           |          |
| 13. Total regularly admitted boys.....   |         |              |           |          |
| 14. Total regularly admitted girls.....  |         |              |           |          |
| 15. Total provisionally admitted .....   |         |              |           |          |
| 16. Total from high-school district..... |         |              |           |          |
| 17. Total county.....                    |         |              |           |          |
| 18. Total other counties.....            |         |              |           |          |

a Give the grade of honors obtained in each department in each year of the university course.

b Insert here the number in the form preparing for the next preliminary examination.

IV. Names of pupils provisionally admitted, with reasons for admission.

V. Fees per year: Residents of district, \$——; county pupils, \$——; nonresidents, \$——.

VI. Names of text-books not in the authorized list used by pupils of Form IV.

VII. Changes in accommodation since last visit of inspection.

VIII. Analysis of time-table.

[Please fill in the number of times a week each subject is taken up in each subdivision of the departmental forms, noting where subjects are taken together, and where there is a difference in the length of the lesson spaces.]

Length of lesson spaces ——.

| Name of subdivision of form.                 | Form I. |  |  |  |  | Form II. | Form III. | Form IV. |
|--|---------|--|--|--|--|----------|-----------|----------|
| English:                                     |         |  |  |  |  |          |           |          |
| Grammar .....                                |         |  |  |  |  |          |           |          |
| Rhetoric and composition .....               |         |  |  |  |  |          |           |          |
| Essays .....                                 |         |  |  |  |  |          |           |          |
| Literature .....                             |         |  |  |  |  |          |           |          |
| Supplementary reading .....                  |         |  |  |  |  |          |           |          |

#### IX.

NOTE.—The grading of each department is based upon the inspector's estimate of, first and chiefly the ability of the teacher or teachers; and, secondly, the organization. In the case of science the equipment and accommodations are also taken into account. For Grade I the following are indispensable: in English, supplementary reading in English literature; in mathematics, provision for mental arithmetic; in science, practical work by the pupils in each subdepartment; in classics, attention to pronunciation and practice in sight translation; in French and German, attention to pronunciation and conversation and practice in sight translation; and in the commercial department, stenography.

Provision in each form for—

- (1) Sight work in classics and French and German.
- (2) Conversation in French and German.
- (3) Mental arithmetic.
- (4) Supplementary reading in English literature.

Certified correct.

APPENDIX D.

*RELIGION AND THE STATE SCHOOL SYSTEM IN UPPER CANADA.*

[From The Educational System of the Province of Ontario, prepared for the Columbian Exhibition by John Millar, B. A., deputy minister of education, printed for the education department, Toronto, 1892-93.]

ITS RELATIONS TO CHURCHES.

There is no established church in Ontario or connection between church and state. The constitution gives the Province control of its educational affairs, and the great majority of the people believe that schools and colleges should be nondenominational. No religious body has any voice in the management of the high and public schools or the university. These institutions are, however, far from being "godless" or irreligious. Though not religious, they are institutions of a Christian people. The doctrines of no church are taught, but the principles of Christianity form an essential feature of the daily exercises. The teachers are, with very rare exceptions, men and women of high moral character. The cooperation of the clergy of all denominations in educational gatherings is quite common, and recognition of religion is fully shown in the following regulations which have been prescribed by the education department:

(1) Every public and high school shall be opened with the Lord's Prayer and closed with the reading of the Scriptures and the Lord's Prayer, or the prayer authorized by the department of education.

(2) The Scriptures shall be read daily and systematically without comment or explanation, and the portions used may be taken from the book of selections adopted by the department for that purpose, or from the Bible, as the trustees, by resolution, may direct.

(3) Trustees may also order the reading of the Bible or the authorized Scripture selections by both pupils and teachers at the opening and closing of the school, and the repeating of the ten commandments at least once a week.

(4) No pupil shall be required to take part in any religious exercise objected to by his parents or guardians, and in order to the observance of this regulation, the teacher, before commencing a religious exercise, is to allow a short interval to elapse during which the children of Roman Catholics and of others who have signified their objection may retire.

(5) If, in virtue of the right to be absent from the religious exercises, any pupil does not enter the schoolroom till fifteen minutes after the proper time for opening

the school in the forenoon, such absence shall not be treated as an offense against the rules of the school.

(6) When a teacher claims to have conscientious scruples in regard to opening or closing the school as herein prescribed, he shall notify the trustees to that effect in writing; and it shall be the duty of the trustees to make such provision in the premises as they may deem expedient.

(7) The clergy of any denomination, or their authorized representatives, shall have the right to give religious instruction to the pupils of their own church in each schoolhouse, at least once a week, after the hour of closing the school in the afternoon; and if the clergy of more than one denomination apply to give religious instruction in the same schoolhouse, the board of trustees shall decide on what day of the week the schoolhouse shall be at the disposal of the clergymen of each denomination at the time above stated. But it shall be lawful for the board of trustees and clergyman of any denomination to agree upon any hour of the day at which a clergyman, or his authorized representative, may give religious instruction to the pupils of his own church, provided it be not during the regular hours of school. Emblems of a denominational character shall not be exhibited in a public school during regular school hours.

The Imperial statute, called the British North America act, which united the provinces forming the Dominion of Canada, guaranteed certain educational privileges to the Roman Catholic citizens of Ontario. The separate schools act, as it is termed, enables Protestants, as well as Roman Catholics, to establish, under certain conditions, schools for themselves. In these schools, in addition to the ordinary course of study for public schools, religious exercises are taken up under direction of the trustees. The education department has not the same authority under the statute over Roman Catholic separate schools as it has over the public schools; yet in the main features, such as the qualification of teachers, excepting those in religious orders, the selection of text-books, except those required for religious exercises, the authority of the department may be said to be the same. There is no provision in the constitution allowing the establishment of separate high schools, and any private or denominational institutions of this kind which have been established receive no legislative aid, nor are their supporters exempted from taxation for the national schools. The Roman Catholics have shown as little disposition as the Protestants to establish denominational schools for secondary education, and the verdict of all classes appears to be that religious convictions are not interfered with, and that Christian principles are strengthened by attendance at the high schools and collegiate institutes. A few church schools have been opened for boys and several ladies' colleges have been established by different denominations. The course of study in these institutions is, in many respects, similar to that in the high schools, and the students frequently write at the same university and departmental examinations.

---

#### APPENDIX E.

[Extract from Manual Training and Industrial Education, a report presented to the senate and house of representatives of Massachusetts by a commission appointed by His Excellency Governor W. E. Russell in 1891. (Boston, Wright & Potter, State printers, 13 Post-office Square, 1893.)]

#### RECOMMENDATIONS.

We respectfully submit the following recommendations:

1. That the principles and practice of the kindergarten be taught in the normal schools.
2. That the principles and practice of manual training, so far as applicable in the primary and grammar schools, be taught in the normal schools.
3. That the principles and practice of domestic science be taught in the normal schools.

4. That high schools in which a course in the mechanic arts, approved by the board of education, shall be taught to the boys be established and maintained in all cities having a population of 20,000 or more.

5. That high schools in which a course in domestic science, including sewing and cooking, approved by the board of education, shall be taught to girls be established and maintained in all cities having a population of 20,000 or more.

6. Any city or town which, though not required to do so by law, shall nevertheless establish one or more schools for manual training or industrial education open to boys or girls of 14 or more years of age and with courses of study and exercises approved by the board of education, shall receive from the State treasury an amount of money equal to the amount specifically appropriated by such city or town for the support of such school or schools in each and every year, provided the amount paid out from the State treasury to any one city or town in any one year shall not exceed \$5,000.

7. That the State make provision for the training of teachers of the mechanic arts, by establishing at the Massachusetts Institute of Technology or at the Worcester Polytechnic Institute, or at both these institutions, State scholarships open to such young men as, being otherwise well qualified, shall promise to become, after their course of training, teachers in the public schools of this State.

8. That the duty of advising with and aiding school committees of towns and cities in relation to the introduction of kindergarten instruction into the public schools be made the special duty of an agent of the board of education.

9. That the board of education be by law required to appoint an agent whose special duty shall be to advise and aid in the introduction of manual training and industrial education into the public schools, and to visit and report upon all schools in which such training and education are carried on.

LOUISA PARSONS HOPKINS.

EDWIN P. SEAVER.

GEO. E. McNEILL.

## RÉSUMÉ OF ANSWERS SENT BY TEACHERS IN ONTARIO TO A CIRCULAR OF THE ROYAL (BRITISH) COMMISSION ON SECONDARY EDUCATION.

*Question 6 of circular:* How far is secondary education given free of charge in your colony, and how has the system worked?

[From Mr. John Seath, high-school inspector for Ontario.]

(1) In this Province, as elsewhere, there are a number of scholars "whose circumstances would lead them to earn their living by manual labor, and particularly by agricultural labor, but who are unwilling or unfitted to do so." Owing, however, to the continued opening up of unsettled parts of the Dominion, and especially to the proximity of the United States, we have so far experienced no serious difficulty from this source. Large numbers of Canadian clerks and lawyers and doctors readily find remunerative employment in the Northern and Western States of the Union, thus relieving to a large extent the overproduction of those who are unwilling or unfitted to earn their living by manual labor. In this Province, I may add, there is no lack of mechanics or of farm hands (except, occasionally, of the latter during the harvest). Many of these also emigrate—farmers to the northwestern territories, and now and then to the United States, and mechanics to the United States chiefly. Ontario is now pretty thickly populated, and in this respect its condition resembles that of the mother country. We are suffering from the overcrowding of the legal and medical professions and the "genteeler" employments, but owing to the exceptional position of the Province we do not suffer nearly so much as is understood to be the case in the older countries of Europe.

(2) It would be wrong, I think, to attribute the existence of a class that are disinclined to or unfit for manual labor primarily to overeducation or to education out of their sphere. To do so would be to mistake for the real cause one of the immediate effects. The condition of matters under consideration is due, I believe, to one of the strongest sentiments of modern civilization. There are few nowadays who do not desire to improve their own social status or to enable their children to do so, and the higher the civilization the greater the desire. Theoretically, manual labor is esteemed; practically, it is a bar to social advancement. This feeling exists here, though not nearly to the same extent as in the mother country. Besides, many men are by nature disinclined to physical exertion; they prefer mental to physical toil. This is especially true of those who do not realize the fact that mental toil is more laborious and exhausting than physical. The higher education is consequently eagerly sought after as a means of gratifying these feelings. Civilization also engenders or at least stimulates the desire to live in centers of population, where life is pleasanter and the facilities for enjoyment are greater than in the country. If secondary schools exist in these centers it is clear that they will be utilized at all hazards, and that so long as human nature is constituted as it is we can not materially reduce the objectionable pressure by barring the doors of the secondary schools to all except the wealthy. It is, as I have said, wrong to attribute this overpressure to overeducation; the prime motive has its roots in human nature. During the last ten years the attendance at the secondary schools in this Province has been almost doubled, and consequently the output from the secondary schools has been largely increased. This has been due to the general advancement of the Province, the improvement of our public schools, and to the number, efficiency, and cheapness of our secondary schools. The urban population of this country has also increased more rapidly than the rural population, owing to the protective financial system of the Dominion, which has fostered the establishment of factories, situated, of course, in centers of population where there are railways and other facilities. In these, also, are situated the high schools and collegiate institutes, so that this cause has also increased the number of those averse to manual labor.

(3) As to the remedies. If I am right that this objectionable condition of affairs is due to the constitution of human nature, it is to human nature that we should look for the remedy. In the struggle for existence if a man fails to secure a livelihood in one way he will try to secure it in another, even if he has to work with his hands. He will take care, also, that his children do not make their father's mistake. Experience will teach the lesson that a good education makes the farmer and the mechanic better workmen, besides adding to their means of enjoyment. Experience will also teach that manual labor is quite as honorable and at least as healthy as mental labor. So far as I can see, the only school in which man can learn these lessons is that of experience. Learned there, they will be effective. A good deal may, however, be done by those in authority to set matters right.

(a) Access to the professions should be barred to all except those of good attainments and mental ability. In this Province or elsewhere it has been too easy to become a lawyer or a doctor or a teacher, and in particular the university matriculation examination has been too easy. These defects we are gradually removing in this Province. The new curricula will exact a higher standard.

(b) Much may be done to better the condition of the farmer in particular and increase the dignity of his lot. In this Province various effective means have been taken to secure this result. One of the ministers of the local cabinet has charge of agriculture, and is himself a farmer. The agricultural college has also done much to raise the status of the farmers. Agriculture is thus always "in evidence" with us. A third political party, consisting of farmers, has recently arisen here, which, it is said, will hold the balance of power in the Ontario legislature.

[From Mr. J. E. Bryant, M. A.]

Does it unduly draw children away from the farm and lead to their crowding into cities?

It certainly does conduce to the drawing away of children from the farm and the crowding of them into the cities, but whether "unduly" or not is a matter, perhaps, for difference of opinion. There is no inherent virtue in country life that it should be specially concerned, no inherent viciousness in city life that it should be specially deprecated. The fault of our secondary education system lies not in the fact that it is inimical to country life, but that it is inimical to industrial pursuits of every sort. In this it shares responsibility with almost every other national system. Youth is the period not only of learning but of adaptation. The ideals of life are fixed before the age of maturity fully sets in. The result is that a boy educated at one of our secondary schools, with no ideal of life before him but that of some intellectual pursuit, generally adapts himself to that ideal, and becomes, by sheer force of environment, a candidate for some such profession as law, medicine, theology, or pedagogy. The remedy lies (and the word "remedy" is a correct one, for the phenomenon is one of disease, not of normal social order) in the adaptation of our secondary system of instruction not alone to those intellectual pursuits mentioned, but to all other pursuits proper to a well-constituted social order, that is, to the so-called industrial pursuits as well as to the professional ones.

[From Mr. A. H. Morrison, late English master, Brantford Collegiate Institute.]

The professions to-day in Canada, including those of law, medicine, and education, are filled to overflowing with a mass of the so-called educated, who have renounced their legitimate callings on the farm, or at the counter, or in domestic service to inundate the cities, towns, and villages with a deluge of professional mediocrity or worse.

It is not too much to say that many professional men who have been educated at the high schools of Ontario, and who have taken degrees and diplomas at the university, are to-day in a state bordering upon actual want. They can not dig, or will not, having become sensitive by contact with letters, while to beg they are ashamed;

and it requires little keenness of observation to trace the cause of much of the social unrest, distress, and despair of the present age to the virus of miseducation which has infected the blood of the body politic.

A high education engenders wants, desires, aspirations, ambitions. How are these to be gratified?

The thousands that are annually forsaking the country districts and manual labor for the city and its avocations, especially that of teaching, will not return to the country when their educational term is completed, unless it be to take a position as teacher in a rural school, at a salary that would be flouted by a bartender, and this merely as a means to obtain a little more money wherewith to prosecute further studies in medicine, divinity, or law.

A little learning is a dangerous thing, and it is but a little learning that the high schools, as at present constituted, can give. True, the subjects are many, by far too many; there is nothing too lofty nor too erudite for their curricula, from Greek to geometry, Latin to literature, algebra to acoustics, dynamics to drill, psychology to sectarianism, arithmetic to agriculture, trigonometry to temperance; but it is merely veneer, the smattering begotten of systematic cram and ceaseless examinations.

The young man comes to the high school fresh from the country. He may or may not have had some preliminary training in the higher grade subjects taught in the upper schools. He has had to pass a certain examination for entrance—that is to say, he has had to obtain a certain percentage of marks in the following subjects: Reading, English literature, orthography and orthepy, geography, English composition, outlines of Canadian history, arithmetic, writing and drawing, physiology and temperance, but of classics or moderns, or science, or anything approaching to correct, not to say literary, English he need know little or nothing. These things have to be crammed into him at the shortest possible notice by men, or women, so-called specialists, who, more particularly in the smaller schools, are heavily handicapped in their work, being often compelled to teach half a dozen subjects with one or two of which alone they are familiar. In a certain provincial high school the head master, a specialist in French and German, has had to take, besides his own subject, mathematics and science, knowing as much about the last, upon his own confession, as the majority of the students themselves. In another collegiate school drill and gymnastics were coupled with English language and literature, albeit the instructor (*sic*) knew no more of club swinging than of Choctaw, and had not been inside of a gymnasium for twenty-five years.

The outcome may be imagined—superficiality, theory, mere rote work. Of course the larger schools are better officered and equipped, but even in these much of the work done is of the most perfunctory nature, and three-fourths of it worthless to the student in his after life.

The cause of much of the haste, superficiality, and mental indigestion is directly attributable to the fact that we are all attempting to do in one year or two years what should properly take two or four years to accomplish.

The majority of the sufferers plead poverty as an excuse for haste. They can not afford, even with State aid, to protract their time of studies. And now comes in one of the most burning of all the vexed questions connected with the popular education theory. To what extent has the pleader of poverty a right to higher education at all? Is it not a luxury, to be paid for like other luxuries? Is the State bound to provide Greek, Latin, Anglo-Saxon, and the higher mathematics any more than it is bound to provide carriages and horses, footmen, and heraldic devices?

Is popular higher education tending in "this Canada of ours" to happiness and contentment? So far as we have been able to judge we unhesitatingly say it is not, for with education have arisen aspirations that can not be gratified save at the cost of simplicity and honor; the limitations remain the same as before, the desires are doubled or trebled.

As we have already observed, there is a class of students to be found in every high

school of the province to whom certain of the preceding remarks do not apply. They are the children of wealthy men, or of intelligent men, who desire a more systematic and thorough training for their sons and daughters than that accorded to the mere examination hobbyist. These take their studies more deliberately, remain longer in the classes, and usually have the advantage of entering the high schools at an early age, passing into them from the public schools by competitive examination. Many of these students do not enter for the university, or learned professions, or final examinations at all. They drop out sometimes to go to private or to special institutions; sometimes, especially in the case of the girls, to assume home duties; sometimes to obtain clerkships, or assist their fathers in their respective callings. It is to be regretted that many of the best and brightest students thus pass away and are lost, while of those that remain a large percentage are from the country or from the humbler classes, whose sole aim is the teacher's certificate or the coveted pass which admits them to the university, and so to the threshold of the overburdened, underpaid, and often ill-served professions.

REPLIES RECEIVED FROM MR. CHARLES W. ELIOT, PRESIDENT OF HARVARD UNIVERSITY, CAMBRIDGE, MASS., IN ANSWER TO A CIRCULAR SENT OUT BY THE ROYAL (ENGLISH) COMMISSION ON SECONDARY EDUCATION.

*Questions.*

1. What is your experience of the education of boys and girls in the same day schools or in the same day classes?
2. What is your opinion of the working of the system and as to the conditions most favorable to it as regards—  
Age of scholars?  
Size of the school?
3. How best may provision be made for the passing of the scholars from one class of school to another, and for giving aid to poor scholars of promise?
4. What has been found to be the best way of bringing technical into proper relation with general education in your secondary schools?
5. What provision exists for the training of secondary-school teachers? How far is such training provided in connection with the universities?
6. It has been said that the secondary schools of the United States turn out a large number of scholars whose circumstances would lead them to earn their living by manual labor, and particularly by agricultural labor, but who are unwilling or unfitted to do so, and have little prospect of finding congenial employment. How far, if at all, is that statement true? If true, to what cause or causes do you attribute it? And what remedies would you suggest?
7. What proportion of students enter your universities without having previously passed through a secondary school?
8. Has there been any material change since 1865 in the system of public secondary education in your State? If so, what, and on what grounds was it called for? Is the result satisfactory?
9. Has there recently been any considerable increase in the number of private schools in your State? If so, to what cause do you attribute this increase?

1 and 2. In the free public schools of the United States boys and girls are, as a rule, educated together up to the age of 18 or 19, the schools being invariably day schools. The exceptions to this rule are insignificant in number. The preparatory departments maintained by many colleges and universities admit, as a rule, both boys and girls, and these are generally boarding schools. The State and city normal schools, as a rule, admit both men and women, but the women are in great majority. Many of the so-called colleges which admit young men and women are really only secondary schools for persons whose education has been belated. The custom of the country, speaking broadly, is to educate boys and girls together "in the same

day schools or in the same day classes." The method is practicable, economical, and free from serious evils or embarrassments.

In the Eastern part of the United States, among well-to-do people, separate schools for boys and for girls are preferred for children over 12 or 13 years old. In this part of the country, therefore, private and endowed schools, charging tuition fees, are maintained for girls or for boys separately; and the same practice is well established in the large cities of the Western States. These private and endowed schools are sometimes day schools and sometimes boarding schools. An illustration of the strength of this preference has lately been given in Boston, where a private day school expressly intended to keep boys and girls together up to the age of 18, and conducted with great intelligence and generosity, has just been abandoned as hopeless after years of patient effort. The creation of several separate colleges for women in the Eastern States within the past twenty-five years, in spite of the fact that many institutions originally intended for men have been opened to women during the same period, illustrates the same tendency of public opinion.

In my opinion, the education of boys and girls together works well up to 10 or 12 years of age. After that age there seems to me to be advantage in separating the two sexes. The size of the school is not an important consideration, for a large school may easily be divided into small classes or sections. The principal considerations seem to me to be, first, the homogeneity of the community—the more homogeneous the community as regards race, religion, and mode of life the better mixed schools work—and, secondly, the pecuniary competency of the community to provide separate schools for older girls and older boys. Separate schools cost more, and in rural communities are almost impracticable. In most American communities the opinion prevails that girls should have as good an education as boys. The easiest and cheapest way to give effect to this opinion is to teach the girls and boys together.

3. By "the passing of scholars from one class or school to another" I understand the passing of scholars from a primary school to a higher elementary school, and from that higher elementary school to a secondary school. In the United States parents usually keep their children in the public schools so long as they can afford to dispense with the children's labor. Nevertheless not over 5 per cent of the children ever reach a secondary school. The determining consideration is the pecuniary condition of the family, the public schools, secondary as well as elementary, being all free. There is no provision in the United States for giving aid to good scholars in the elementary schools who desire to resort to the secondary schools, but whose parents are not able to give them that privilege. It must be remembered that there are immense tracts of territory in the United States where there are no secondary schools. Cities and large towns ordinarily maintain them, the rural districts seldom.

4. In a considerable number of American cities shops in which various forms of manual training can be given have been added to the public secondary school called the high school. In Boston a separate secondary school called the Mechanic Arts High School has recently been established at public expense. In Cambridge, near Boston, private munificence has provided a manual training school which is in association with the public high school, so that the pupils do part of their work in the high school and part of it in the manual training school. All these recent developments must still be described as experimental. It is not yet clear how manual and technical subjects are to be dealt with in the secondary schools of the United States. The private and endowed schools have made very little effort in this direction. They have recently introduced laboratory methods of teaching sciences, but they have not introduced anything which can properly be called technical education.

5. The best secondary school teachers in the United States are graduates of colleges or scientific schools—that is to say, they have ordinarily received the degree of bachelor of arts, or bachelor of philosophy, or bachelor of science. Within a few years past several American universities have introduced instruction in pedagogy, or at least in the history and art of teaching. The normal schools of the United

States have been thus far schools of a grade but little, if at all, above that of the public secondary schools called high schools, so that the great majority of their graduates are only fit to teach in the elementary schools. This very year a movement has begun to raise the grade of the normal schools of Massachusetts, the intention being to require graduation at a high school for admission to a normal school.

6. The public schools of the United States, being situated, as a rule, in large towns and cities, have very little to do with the children of farmers or of agricultural laborers. They are resorted to, however, by large numbers of the children of mechanics and other persons who get their living by some form of manual labor. It seems to me to be true that the graduates of high schools, both young women and young men, endeavor in after life to earn their living in the lighter and more agreeable employments, in which brains tell for more and muscles for less. No other result could be anticipated. That is just what educated people of all sorts and conditions expect to do. An education which does not produce this effect has certainly missed one of its important objects. I have never observed that the graduates of secondary schools in the United States had more difficulty in finding congenial employment than other young people. I should suppose, on the contrary, that they would have less difficulty. The question does not seem to me to refer to any real evil. It is not the object of an education prolonged till 18 or 19 years of age to produce a coal heaver, or a scullion, or an agricultural laborer, in the English sense of that term. In the higher departments of farm labor in the United States there is, as in other countries in which agricultural machinery is much used, quite as much opportunity for the exercise of trained intelligence and skill as in a machine shop or a factory. In the Western States, therefore, the children of farmers resort in considerable numbers to the universities and to the preparatory schools connected with colleges and universities.

7. I can only answer this question with reference to Harvard University, for I am not familiar with the facts of any other institution. During the past twenty years from one-eighth to one-fifth of the young men admitted year by year to Harvard College (the department which gives the degree of bachelor of arts) had been prepared by private teachers and had not passed through a secondary school, or at least had not completed the course of a secondary school. All the professional departments of Harvard University maintain admission examinations, but the grade of these examinations is below the grade of the examination for admission to Harvard College, except that the theological school accepts no students as candidates for its degree who do not already hold, on entering the school, an academic degree. After the academic year 1895-96 this same regulation will obtain in the law school. I have no means of ascertaining what proportion of students have heretofore entered Harvard University in the professional schools without having previously passed through a secondary school. In general, it has been true throughout the United States that the schools of law and medicine have been open to any applicant, no matter what his previous training might have been, and that the scientific or technological schools have been open on much easier terms than the colleges. The secondary schools have, therefore, lacked the support which they should have received from the institutions of technical and professional education. The colleges may be said, in a rough way, to have given support to secondary education; but owing to the fact that secondary schools have not existed in anything like adequate numbers, many colleges and universities, particularly in the Western States, have felt forced to maintain preparatory departments of their own. In recent years there has been a tendency among the stronger institutions to abandon their preparatory departments.

8. There has been no single material change since 1865 in the system of public secondary education in Massachusetts, but there has been a gradual improvement in the free secondary schools, and there has been an increase in the number of schools called secondary or high. Interesting changes are the increased importance of the superintendent's or supervisor's function, the free provision of text-books, the free transportation of children to central schools from outlying districts, the increased

attention to the English language, the gradual introduction of proper methods of teaching the sciences, and the progressive modification of the traditional school curriculum which admitted Latin, Greek, and mathematics, and little else. All these changes have affected elementary as well as secondary schools.

9. The number of private schools, both elementary and secondary, maintained by the Roman Catholics in Massachusetts has decidedly increased; and the relative influence of private and endowed schools in Massachusetts has also increased within the last twenty years. This is partly the effect of the increased heterogeneousness of the population, both as regards race and mode of life. It is partly due also to the fact that the private and endowed schools have established a distinct superiority to the public schools, because they are freer to experiment with new methods of instruction and to adopt methods which prove to be good, and because they spend more money per pupil. In Massachusetts it has been the private and endowed schools which have adopted most promptly the improvements in education urged upon schools by colleges and universities.

#### MEMORANDUM ON THE TRAINING OF TEACHERS IN ENGLAND.

[By J. G. Fitch, esq., LL. D.]

(1) The importance of giving definite professional preparation to teachers has long been fully recognized in the sphere of elementary education. From the foundation of the two great societies—the National Society and the British and Foreign School Society in 1811 and in 1808, respectively—persons desiring to become teachers in National or British schools were received at the Sanctuary, in Westminster, or at the Borough Road to “learn the system” by a few months’ attendance at the model schools; the Home and Colonial School Society established its training school in 1836; and before any public grants were made for the purpose in England, Dr. J. Phillips Kay, afterwards better known as Sir James Kay-Shuttleworth, had, by private effort and in conjunction with Mr. Carleton Tuffnell, succeeded in establishing a training school at Battersea. In 1839, when, under Lord Melbourne’s Government, a committee of the privy council was appointed to administer such funds as might be voted by Parliament for public education, among the first proposals made by that committee, at the suggestion of its secretary, Dr. Kay, was one for the establishment of a State normal institution for the training of teachers. This proposal was not adopted by the legislature, but encouragement was given to religious and voluntary bodies, and by 1846, when the first minutes of council were issued, 9 training institutions, including Whitelands, Warrington, and St. Mark’s, Chelsea, had been established. Within the ten subsequent years many diocesan colleges, the Wesleyan Training College at Westminster and the Roman Catholic College at Liverpool, were added to the list, and there are now 43 residential training institutions in England and Wales. They all owe their origin to local effort, to educational societies and religious bodies, but receive large subventions from the education department, amounting to about three-fourths of the annual cost of their maintenance.

(2) The professional qualifications of a teacher, which it is the business of a training college to provide, are held to include:

- (a) A full and thorough knowledge of the subjects to be taught.
- (b) Acquaintance with the best methods and rules of school organization, teaching, and discipline, and with the principles which underlie those rules.
- (c) So much of the elements of ethics, logic, and psychology as has a bearing on the art and philosophy of teaching.
- (d) Some knowledge of the literature of education and of the lives and works of famous teachers.
- (e) Actual practice under supervision in the art of teaching a class and conducting a school. [By the regulations of the department, every student is required to

---

<sup>1</sup> From vol. 5 of the Report of the Royal (English) Commission on Secondary Education.

spend during the two years of training not less than one hundred and fifty hours in the practicing school.]

(f) Criticism lessons and the preparation of notes and sketches.

(g) Observation of good models, both of teaching and of school organization and equipment.

(3) All experience has tended strongly to confirm the belief in the great value of this discipline. There are, of course, exceptions. On the one hand, a few persons enter the profession so remarkably qualified by personal enthusiasm and special aptitude that they achieve success without any technical training; and on the other, it is possible for some to pass through the whole of such a course who fail to be inspired by it, and who are, after all, content to fall into routine and to remain in the lower ranks. But these cases are comparatively rare. All school managers know that there is, as a general rule, an enormous difference between the trained and the untrained teacher; and that although many of the candidates who pass through the normal colleges can not be said to possess a liberal or an extended general education, yet what they know they can teach by right methods and with good effect. Indeed, all who are familiar with the kind of teaching to be heard in ordinary grammar schools and middle schools, and who have also listened to the lessons given by trained teachers in the elementary schools, are struck by the contrast, by the freshness, the skill, and the variety of illustration to be found in the one, and the dullness, the mechanism, and the mere memory work which often characterize the other. Relatively to the subjects he has to teach, there can be little doubt that, as a rule, the trained elementary teacher is the better craftsman.

(4) It should be observed, however, that a large proportion of the time now devoted to study in the training colleges is necessarily devoted to the first of the purposes enumerated in paragraph 2, owing to the imperfect education generally possessed by the candidates on admission. It is evident that if the students already possessed, or were obtaining in some other way, an adequate acquaintance with the ordinary subjects included in the course of education in all liberal professions alike, the problem would be much simplified, and the time devoted to special normal training might be greatly reduced.

(5) The education department has lately recognized the distinction between general and purely professional qualifications by means of new regulations, e. g.:

(a) By dividing the requirements of the syllabus for the certificate examination into two distinct sections, Part I including reading, recitation, school management, music, the principles and practice of teaching, and (for girls) needlework and domestic economy; and Part II comprising history, literature, language, mathematics, geography, and science, the usual subjects of an advanced course of general instruction.

(b) By retaining in the hands of the department the examination in Part I, and by providing as follows, for all students who may furnish other and satisfactory evidence of their proficiency in the general or academic subjects:

"Students in training colleges who pass in any British university an examination approved by the department will not be required to present themselves for examination in those portions of Part II of this syllabus which were included in that university examination."

(c) By recognizing as day training colleges a new class of institutions—normal classes or departments attached to provincial or other colleges of university rank, in which the students are placed under special instruction in pedagogy from a normal master or mistress, and are so prepared to pass the department's own examination in Part I; while receiving, in common with other students who are not intending to become teachers, instruction from the college professors in the literary and scientific subjects included in Part II.

(6) These proposals have materially modified and are likely in the near future to affect still more significantly the whole problem of training for elementary teachers. Nearly all the most important academic bodies in England and Wales, including the

University of Cambridge, King's and University colleges in London, and Owen's College, Manchester, have expressed their willingness to cooperate with the education department on the basis of its new regulations, and have made arrangements satisfactory to that department for the due instruction and practice of those of their students who desire to become teachers. Liberal grants are now made by the department in respect both to the instruction and the maintenance of such students during their two-years course. There are now, in addition to 43 residential colleges, 14 day training colleges of this new type. In the colleges of the former class there are 1,384 men and 1,961 women, and in the day colleges 284 men and 276 women, but this latter number is likely to be substantially increased ere long.

(7) It is too early to estimate the comparative merits of these two classes of institutions, or to forecast the probable effect of the introduction of a new class of trained agents into the ranks of the elementary teachers. Until we know how the young people trained under the new conditions shall have been found to compare with the existing teachers, not only in attainments but in character, sympathy with the work, and general moral influence, the data for the formation of an accurate judgment are not before us, and it would be premature to hazard an opinion. It may, however, be said that while I have good reason to appreciate the great merits of the residential colleges, the excellence of much of the teaching, and the guarded and careful discipline which at a very critical age is provided for the students, I have long been conscious of some disadvantages in the seminary system. In a community composed exclusively of young people who are of the same age and the same previous experience, who are looking forward to the same future career, and who are taught for the most part by persons similarly trained, there is, as I have said in official reports, a want of breadth and freedom, and an inevitable closeness in the intellectual atmosphere. The students are all working with the same syllabus in view; they see little beyond it, and they have scarcely any opportunity of comparing what they know with the standard of a liberal education as it is recognized in other professions. On the other hand, the students in the day colleges lead a freer life, they are earlier taught to feel responsibility for the employment of their own time, and the conditions under which they receive their general instruction are in some respects more favorable to breadth of vision, self-knowledge, and general culture. There is of course, however, less security for moral and religious discipline, less of comradeship and of opportunity for mutual help. It should be added that in America, Germany, and France, as well as in Scotland, most of the normal students reside at their own homes, and attend the college by day only. It is understood that difficulties respecting the conduct or discipline of the students are very rarely found to arise from this cause.

(8) The whole of the existing system of training colleges in this country, whether for day or residential students, presupposes that the large majority of the candidates have passed through their period of apprenticeship as pupil-teachers, and have reached the age of 18. Hence the two years' course of normal instruction is so planned as to be suitable for students in their nineteenth and twentieth years. But it is manifest that where the pupil-teacher system does not exist other arrangements may be expedient. In the normal colleges of America, and in most continental countries, students are admissible at 16. They are not, however, required to enter on the practice of teaching in schools until the later years of their course.

(9) If it be deemed expedient to make use of the experience which has been gained in the domain of elementary instruction, and to adopt, with needful modifications, some analogous measures for the better preparation and equipment of secondary teachers, it would appear that two of the most effective means of attaining this object are (1) the further development of the existing normal departments in the provincial and other day colleges, and (2) the more direct action and influence of the universities.

(10) In regard to the former of these expedients, it happens that my last report to the education department contains one or two passages which were written in anti-

pation of some such inquiry as that on which the commission is now engaged. I need not, therefore, apologize for reproducing the arguments in this place:

(11) "I look forward with strong hope to a further development, in the near future, of the usefulness of the day training colleges. The need for some form of professional preparation for the teachers in secondary schools is likely to be more and more strongly felt every year. It is a trite thing to say that teaching is a fine art; that it has its rules and laws; that those rules have their true justification in psychology and in the constitution of human nature; that there are right and wrong methods of disciplining and handling a class, of presenting truth to a learner's mind, of organizing a school, and of economizing the time and power of the teacher; and that there are reasons to be given why some are right and others are wrong. These are elementary truths which have been long recognized in connection with the teaching in our primary schools. But although they are applicable to all schools alike, they have hitherto received scant recognition in the sphere of secondary and higher instruction. Already, however, the universities of Cambridge and London have taken measures to encourage intending teachers to study the art and philosophy of teaching and the best educational literature. By some of the most distinguished head masters of public schools, and by such governing bodies as the council of the Girls' Public Day Schools Company, those candidates for appointment who possess the teachers' diploma are *ceteris paribus* preferred, and are found in practice to have a great advantage over others who, though well equipped with knowledge, have never given any heed to the art of communicating what they know. Yet the aspirant to the calling of a secondary or public school-teacher may complain with reason that however he may desire systematic guidance and preparation before entering upon his work, he does not know where to look for it. The existing residential training colleges are not open to him; and the only attempts made in England to establish a training institution for secondary schoolmasters proved to be a failure. Schoolmistresses have from the first shown a keener perception of the need of professional education than their brothers, but the supply of such training, even for them, is lamentably inadequate. The Maria Grey College at Brondesbury, the Cambridge Training College for Women, the department for student-teachers in the famous Ladies' College at Cheltenham, and the nongovernment department at the Home and Colonial Training College, are the only resources known to me by which gentlewomen who wish to qualify themselves as teachers in intermediate and higher schools can obtain systematic instruction.

(12) "In these circumstances, the establishment of normal departments in the great provincial colleges of university rank in England and Wales, and the encouraging success which has already been attained in those institutions, open out an opportune and most hopeful prospect. It is not likely that new institutions expressly designed like the first two just named will be multiplied even for women. Still less is it likely that any such institutions will be successfully established for men. Nor is it quite clear that it would be desirable. Neither in France nor America, nor in any country known to me, is it the practice to require special training in a normal seminary in the case of candidates for teacherships in higher schools. Such seminaries are indeed needed for primary teachers, because the general education of the class from which they are drawn is deficient, and because, in fact, three-fourths of the time spent in those seminaries is required for instruction in language, literature, history, and mathematics, subjects which form essential parts of every system of general education and are required in all liberal professions alike. Presumably the young student who is destined to become a teacher in a high school has acquired all this in some college or university. What he wants is a special course of pedagogic instruction and practice, as a technical supplement to his general studies, analogous to that which would be needed if he contemplated law or medicine as his career. And this special preparation will probably be best found, not in an institution composed exclusively of persons whose whole studies are directed by a syllabus, and with a view to a professional examination, but in a separate normal department

in a good general college, wherein for six or twelve months he may devote himself mainly to a study of the principles and methods of education, and to systematic practice, under due supervision and criticism, in one or more good schools.

(13) "Now, this is precisely the want which the institutions, now newly recognized by your lordships as day training colleges, have it in their power to supply. The authorities of these institutions have already become interested in the professional training of teachers. They have seen the advantage of the practical lessons in school management, and of the theoretical study of methodology which your lordships' regulations prescribe for the future masters and mistresses of elementary schools. They have taken pains to comply with those regulations by appointing a master of method. Besides this, in several cases, notably at Bristol, Nottingham, and Cardiff, one of the most eminent professors gives to the normal students a special course of lectures on so much of logic, ethics, and mental philosophy as has a direct bearing on the art of teaching. And it has thus become evident that, *mutatis mutandis*, much of the same discipline would prove of great value to the teachers of secondary and higher schools. Some modifications would necessarily be made. Much of the student's practice, though not the whole of it, might fitly be obtained in the best secondary or grammar schools in the neighborhood, and the course of theoretical and practical studies would be guided rather by the curriculum set forth by the Cambridge syndicate or the London University senate than by the syllabus of the education department.

(14) "One experiment in this direction is about to be made in connection with the University College at Nottingham. The following is an extract from the public announcement recently put forth by the authorities of that institution:

"UNIVERSITY COLLEGE, NOTTINGHAM.

*"Proposed courses on the science and history of education in connection with the examinations under the teachers' training syndicate (Cambridge University)."*

"The great advance which has been made in educational matters during the last twenty years renders it more necessary than ever that a teacher should possess a sound knowledge of the science of education, as well as proficiency in the art, if he or she is to attain to the highest success in the profession.

"That the education department has fully recognized this is shown by the fact that during the last ten years candidates for the certificate examination have been expected to show an acquaintance with the elementary principles of psychology and logic, in addition to their practical knowledge.

"Two of our universities (London and Cambridge) have for some years past recognized the importance of this department of knowledge by granting a diploma to all candidates who succeed in passing their examinations in the theory, history, and practice of teaching. The London examination is, however, open only to graduates, and hence many teachers are unable to avail themselves of its advantages. At Cambridge, on the other hand, the regulations are much more elastic.

"It is proposed, therefore, to establish a course of lectures at University College, Nottingham, in order to prepare for this examination. The course will be on Fridays from 7 to 8, and will be continued in the third term. The fee will be 5s. per term.

"The main purpose of the course is to enable teachers to obtain a wider and more complete knowledge of the science and history of education.

(15) "In the prospect of any further measures which may attach added importance to the professional qualifications of teachers in all ranks, or which may provide for the registration of such qualifications, it may be expected that the precedent thus to be established at Nottingham will prove to be so useful and successful as to be extensively followed. Grants from the education department will, of course, neither be needed nor asked for on behalf of the additional students received under the new conditions, and such students will take university diplomas and not Government

certificates. But men and women who shall have availed themselves of these new provisions are likely to be distinguished by a truer and broader conception of the teachers' art, and to exercise greater skill in practicing it. Their possible influence on the views and aims which may prevail in the higher ranks of the teachers' profession can not easily be estimated at present, but it can not fail to be beneficial, and I do not doubt that teachers so qualified will be able to render exceptional public service.

(16) "Any such extension of the training system to secondary teachers will bring into view the subject of practicing schools—their supply, their relation to the work of training, and the use which should be made of them. It may be well, therefore, to put on record here the result of such experience as has been gained in connection with the colleges already aided and inspected by the department. A fear has often been expressed that it would be difficult to find proper provision for the practical work of secondary school masters and mistresses, owing to the disturbance which would be caused in the schools and to the unwillingness of the head teachers to allow a class to be made a *corpus vile* on which experiments should be tried. This fear I believe to be groundless. No doubt the presence of one or two teachers who are not on the regular staff interferes a little with the organization, and renders necessary, on the part of the head teacher, some slight adjustment of his plans. But this trifling disadvantage is much more than compensated by the greater freshness, life, and variety which are introduced into the school work by teachers presumably interested in learning their profession and anxious to distinguish themselves. It is a familiar result of experience that there is a higher general level of intelligence in schools which are frequented for purposes of students' practice than in ordinary schools. This is so strongly felt in many places that there is often a competition among the head teachers for the privilege of receiving the visits of the students. The boards at Liverpool, Birmingham, Newcastle, and Sheffield, and other towns place the best of their schools at the disposal of the college authorities, and the teachers regard it as an honor when their schools are selected. I always ask the masters and mistresses whether they find the presence of the students a help or a hindrance, and the answer is almost invariably satisfactory. The head teachers are pleased to have additional influence and opportunities of usefulness; they often give very valuable counsel to the students, and almost without exception they fill up the returns connected with the conduct and teaching powers of the several students in a way which shows insight and sympathy, and furnishes valuable help to the college authorities." (Report of Committee of Council for 1892-93, pp. 159-161.)

(17) In each of two Scotch universities—Edinburgh and St. Andrew's—a special professorship in education has been founded by the trustees of Dr. Andrew Bell's estate. In Cambridge occasional lectures on the science and history of education have been given, and a syndicate has been formed with power to institute examinations and to recommend the granting by the university of special diplomas to intending teachers. The University of London has also instituted similar examinations, the conditions differing in only two main particulars from those of Cambridge, viz, (1) in requiring that none but persons who have already taken a degree shall be candidates, and (2) in insisting that all candidates shall pass the practical as well as the theoretical part of the examination. But it can not be said that at present any English university has taken seriously in hand the professional training of the schoolmaster as an integral and organized department of its academic work.

(18) It is universally admitted that the first duty of a university, to all its students alike, is to give general, not special or professional, education, *literæ humaniores*, the learning which has no visible or immediate relation to the mode whereby a man is to get his living, but which helps him to live and to spend his life worthily. A secondary purpose has, however, always been recognized as legitimately within the scope of a university. This purpose may be described as that of ennobling and liberalizing the higher professional employments and preventing them from degenerating into trades. Accordingly schools of law, of divinity, of medicine, and even

of engineering have found their appropriate places in the organization of universities, and rewards and honors have been awarded to successful students. These students have been for the most part pursuing post-graduate courses and supplementing the general knowledge represented in the ordinary degree by the special reading and exercises appropriate to their several professions. Now, it is much to be desired that the profession of teaching should be placed in a similar position. It is the calling to which large and constantly increasing numbers of graduates are intending to devote themselves, and for which they have at present little opportunity to qualify themselves. It is not unreasonable that they should look to their alma mater for some help and guidance before undertaking their life's work. A school or tripos of education might, as a first step, be established. "Pedagogy," it may be remarked in passing, is an ugly word, to which the ear of the English public is not yet reconciled, although it or its equivalent is generally accepted and understood in France, Germany, Switzerland, and the United States, and can, therefore, hardly be avoided. The late Professor Pillans preferred the term "didactics." If the universities were once induced to undertake the work, the establishment of an honor examination on this subject would require to be supplemented by the appointment of a lecturer or professor, qualified not only by his theoretical and practical knowledge and his power of exposition, but also by actual acquaintance with some of the best methods in use both in English and foreign schools. It would also be necessary for the professor and the university to be placed in such relations to the heads of some of the best public schools of different types as might insure for all the students ample opportunities of practice under observation. Diplomas granted by the universities on such conditions would soon come to be highly valued, and would go far to create a strong public opinion in favor of training as an almost indispensable element in the qualification of teachers in all ranks.

Some useful experiments have been tried in one or two public schools and in the Ladies' College, Cheltenham, with a view to train "student teachers," while on probation, in the methods of conducting school work, and especially in giving class lessons. What is called in the State of Michigan and in other parts of the American Union the "cadet system" is planned on a similar principle. Both methods may well deserve fuller examination than they have yet received; but it will probably be found that neither can be regarded as more than a temporary and imperfect expedient, and that both fall far short of providing the instruction in the art and principles of teaching which is required to make a skilled practitioner in that art.

#### TRAINING OF TEACHERS OF SECONDARY SCHOOLS IN FRANCE.

[By Mr. Herbert Ward, B. A., one of H. M. inspectors of schools, etc.<sup>1</sup>]

"The best feature of these (the French public secondary) schools seems to be their thoroughly trained and tested staff of professors." So wrote Mr. Matthew Arnold in 1868 after an account of the qualifications required in teachers of French secondary schools, and a glowing description of the higher normal school at Paris. It is here proposed to discuss this dictum and to examine its accuracy, especially in view of the more recent development of the French school system.

What is to be understood by the "thorough training" of a teacher? As such training admittedly does not exist in England for teachers in secondary schools, even the necessity of it being denied by a great many, we are driven to seek an analogy from the elementary schools.

In elementary education in England and France alike it means two things. A trained teacher is one who, in the first place, has been fully instructed in the matters which he will have to teach. The certificate of the education department, granted to training-college students upon examination, and also to acting teachers,

<sup>1</sup> From vol. 5 of the Report of the Royal (English) Commission on Secondary Education.

is a guarantee that the elementary teacher knows his English, arithmetic, geography, and what not; and the South Kensington certificates testify similarly to his possession of some knowledge of the branches of science and of that in which he has been examined. But "a trained teacher" connotes something more. The phrase implies that besides instruction in the matter of his teaching he has also received lessons in the method. In the English system of elementary education at the training colleges, and to a varying extent during the period of apprenticeship to pupil-teachers, regular courses of lessons are given in school method and school management. The same is true of French normal schools. School method and management embrace not only the details of the teaching of particular subjects, but also psychology and logic as applied to education and hints on the administration of schools. Lessons before elementary classes for the purpose of criticism are constantly given or heard by teachers under training, and model lessons are shown them by the master of method. Moreover, they have practice in teaching in schools during the apprenticeship under the eye of a head master, during the training college course, under the direct and constant supervision of the method master.

Of these two sections of the training of teachers, neither exists for secondary schools in England. There is no express provision for cultivation on the intellectual side for the man who would teach in a secondary school, still less is there any instruction in the science and art of imparting knowledge on the theory of education. It will be found that in France there is a tolerably complete organization to secure the former—the intellectual training and testing of the future teacher—and so far Mr. Arnold's saying is fully justified. But before it can be accepted as covering the second kind of training, in method, very considerable qualifications will have to be introduced. It is not within the scope of this memorandum to discuss the necessity, or otherwise, of the professional training, so to speak, of the teacher in secondary schools, but simply, in view of those who demand that there shall be some, to point out the state of things in France.

It is desirable, by way of preliminary, to notice two or three contrasts and distinctions. In the first place, secondary schools in France are divided into two well-marked classes, lycées and collèges. The leading difference between the two is one of administration, for the lycées draw upon state funds, while the collèges are supported upon municipal or communal funds. But besides this there is an important difference in prestige, a difference accentuated by governmental regulations as to the staffing, for the conditions of appointment of masters in communal collèges are not so severe as those which govern the appointment of masters in lycées. There is a special scheme of salaries for professeurs de collège distinct from that of the professeurs de lycée. In general, the staff of a college will not be so distinguished as that of a lycée, and presumably the instruction will not be so good. Any generalization, then, concerning professors of lycées will not necessarily be true of professors of communal collèges, who until recently could not claim the title of professor. It is upon the former that the attention of foreign inquirers has usually been directed. It was of these professors that Mr. Matthew Arnold was chiefly thinking when he spoke of a "thoroughly trained and tested staff of professors." But, having in view the number of communal collèges, we can not overlook the large body of teachers in them without grave danger of misconception.

Another important distinction, which illustrates also a curious contrast to English methods, exists in the staff of all public secondary schools, whether they are state or communal schools. Most of them are on the boarding system. In England this would entail increased work upon resident masters in the way of "house duty." In France, on the contrary, the teacher has not (except accidentally in small communal collèges) any house duty whatever. When his teaching work is over he is completely free, and all supervision, whether of private study, preparation, or recreation, is undertaken by a body of ushers, who are called variously *maîtres d'étude* or *maîtres répétiteurs*. The ushers, of whom there are some even on the staff of those schools which receive only day boys, are usually men who are reading for a higher degree or

certificate than the one they must possess. They do no teaching work, except in the case of the best qualified, who give help in preparation, and except, upon emergency, when they may be called upon to fill a temporary vacancy. But from their number are recruited to a very considerable extent the masters in the communal colleges and smaller provincial lycées. They, too, therefore, although not, while in the exercise of their proper functions, teachers, must be taken into account in any discussion upon teachers in French secondary schools. A third distinction to be noticed is that between the elementary division of a secondary school and the two higher divisions. While the qualifications for masterships in the higher divisions almost necessarily presuppose an education in a secondary school, certain specially qualified primary schoolmasters, who have very rarely passed through a secondary school, are admitted to teach in the classes of the elementary division. There is also a special certificate qualifying the holder to teach such classes in the lycées, a certificate well within the reach of a primary schoolmaster. The elementary division, it should be said, prepares boys to begin a secondary education proper in the division de grammaire, and its course hardly differs from that of the primary school, except in the important addition of a modern language. But the division is so integral a part of most schools, except the highest Parisian lycées, that its professors should be included in our survey. A still lower division, which may be found in some schools, is the division of primary classes, but for practical purposes there is no need to consider it apart from the elementary division.

These distinctions being clear, the intellectual training of teachers in French secondary schools may now come under discussion. I deal at present with the classical lycées and colleges for boys—the most numerous and oldest of public secondary schools—leaving for subsequent treatment the “modern” departments and schools for boys and the girls’ schools. Admission to the various functions is an affair of degrees and certificates, and all masters (except the *répétiteurs*) are appointed by the minister of public instruction, who selects his candidate from a list of persons competent for the post which is vacant.

There are two main degrees which concern the future professor, the degree of bachelor (*bachelier*) and that of licentiate (*licencié*), which Mr. Arnold roughly compares to the English bachelor and master of arts, respectively. The degree of bachelor admits its possessor to the functions of *répétiteur* or *préparateur* (a higher kind of usher, whose work is sufficiently indicated by the name) in a college, and also, after a short probationary period, to the same post in a lycée. It further enables a man to take provisional charge of a class in the higher divisions of a college, though not the “titular professor” of the class. The licentiate may be titular professor in a college, but only provisionally in charge of a class in a lycée. In order to be full or titular professor in a lycée, the licentiate must have competed for and won the title of “*agrégé*,” a peculiar scholastic distinction, an explanation of which is for the present postponed. The difference between a full or titular professor (*professeur titulaire*) and the provisional professor (*chargé de cours*) is not only one of prestige; the titular professor is a sort of form master acknowledged, and his tenure of office is secure, whereas the *chargé de cours* may be removed to make way for one qualified to take the permanent post. And also, as salaries in French secondary schools vary according to qualification and experience, there may be an important difference in the stipends of a titular and a merely provisional professor. In spite of the insecurity, there are often more provisional than titular professors in the remoter colleges and lycées where the fully qualified teacher can not be induced to settle. In the elementary division the special certificate of fitness alluded to before admits to the best posts, those in the lycées; but to be provisionally in charge of elementary classes in lycées and to be full professor in colleges the bachelor’s degree is sufficient, or the certificate of a primary head master. For primary classes, primary schoolmasters and schoolmistresses are usually drafted in from their schools.

The possession of diplomas and certificates, upon which the French so emphatically insist, is at any rate some guaranty of intellectual capacity in the teacher, as Mr.

Arnold pointed out. The degree of intelligence involved in the diplomas needs some further elucidation. Leaving aside the certificates of teachers of elementary classes, which imply a good higher grade elementary education, with the addition of a foreign language in some cases, we may broadly say that the first condition of entering the profession of teaching in secondary schools is the possession of the bachelor's degree. How far, then, does this degree correspond to what is commonly required, though not, as in France, legally necessary, in a secondary school-teacher in England, a university pass degree? The examination consists of two parts, both founded on the work done in the upper division of a secondary school. The first part, which embraces the programme of the upper division as far as and including that of the top form but one (*classe de rhétorique*) is compulsory on all candidates. It consists chiefly in Latin, Greek, French, history, and one modern language. It appears to me to correspond roughly to the intermediate examination in arts at the London University, or to the matriculation examination of those colleges at Oxford and Cambridge where some strictness is exercised. In the second part, which covers the work done in the highest form (*classe de philosophie*), there is, to a certain extent, liberty of choice. The subject being philosophy and its history, mathematics, physics, and chemistry, the candidate can emphasize, which he will by choosing to be examined on paper in one and orally in the rest. As the whole examination is well within the reach of an average boy of 18 in the top form, it should be below rather than above such examinations as the London and Victoria universities' pass B. A. and the M. A. of the Scotch universities. It would seem, then, that the minimum qualification necessary for the teacher in a French secondary school is nearly the same as in practice is required in England. But while in England a pass degree can be won and is frequently won by men who have had no secondary school education, for example, an elementary schoolmaster, it would be more difficult to gain a French degree by mere private study. Hence it is that few primary schoolmasters in France enter the secondary schools by this gate, while, on the contrary, in England the number is not inconsiderable.

It is to be remarked that there is nothing in the regulations to prevent a bachelor from teaching the highest forms in a communal college, although, according to the distinction already explained, he would not be recognized as "filling the chair," but only as a provisional substitute for a titular professor. But, whatever be legally possible in practice, the teacher in a communal college must possess the degree of licentiate. That this degree and not that of the bachelor is the real teacher's diploma is abundantly shown in the official "programmes" and instructions. In the preamble to the regulations for the licentiate's examination we read: "The knowledge required of the candidate is that which is obtained in secondary education, with the difference that at the baccalauréat the examining body is questioning a pupil, at the licentiate it has before it a future professor destined shortly to take charge of a class." Accordingly the syllabus is drawn up to meet the intellectual requirements of the intending teacher. "He must show that he knows everything that is necessary to conduct the lessons with which he will be intrusted as a master in a secondary school." "The establishment of a licentiate's degree in history and geography is intended to furnish our colleges and even in certain cases our lycées with professors of geography and history who have received, along with a genuine literary culture, a training in history and geography." The inferior degree involved an examination on the whole classical curriculum. In the higher degree of licentiate there is specialization on the lines of the specialization of functions in a secondary school. Thus, there are "licenses" on the letters side in philosophy, in letters, in history and geography, and one also with special mention of modern languages; on the science side there are subdivisions parallel to the subdivisions of the work in science and mathematics in the school. In each case what is required is a more extended acquaintance with one of the departments of knowledge embraced in the syllabus for the baccalauréat. It is not necessary to give the programmes in full. My impression is that the licentiate's examination in letters (i. e., pure classics, with the important addition of

French classics) corresponds broadly with the London University B. A. examination (honors in classics) or the honor school of classical moderations at Oxford. It will be seen that work for this degree is university work rather than school work. It is ordinarily taken by those who are in attendance on courses at university centers. But attendance is habitually excused in the pupils of the higher normal school, and exemption is readily obtained by those who are actually engaged in teaching or supervising while reading for their degree.

I have dealt so far with the qualifications of teachers in communal colleges chiefly; there remains the qualification of the full professor in lycée. The titular professor in a lycée must be "agrégé." This coveted title is not a degree, because it is given after competition and not after public examination. The number of "agrégés" in a particular year depends upon the needs of the lycées, so far as those needs can be foreseen. Thus, though the distinction is enthusiastically termed "the crowning and final consecration of the studies of our young professors, the "agrégation" by its very nature can not be reached by the great body of teachers in French secondary schools. There is no precise English equivalent to the "agrégation." By some it is compared with the fellowship; but while there may be, approximately, the same severity in the tests, there are few other points in common. A teacher may be "agrégé" in any of eight orders—philosophy, letters (higher), history and geography, grammar (lower letters), modern languages, mathematical sciences, physical sciences, and natural sciences. There is no special syllabus issued. In his own subject the candidate is expected to display not only thorough knowledge but even erudition. A professeur agrégé is regarded so much as an expert in his own department that under certain circumstances he may be intrusted with supplementary courses at a university center. For the present purpose there is no need to do more than emphasize the necessarily restricted number of those who are "provided with the title of agrégé," and to insist upon the extreme severity of the test.

It will be seen from the foregoing that so far as guaranties of intellectual capacity are concerned the French system of choosing their secondary schoolmasters leaves little to be desired. To supervise in schools of both first and second rank, and on occasion to teach in those of second rank, the degree of bachelor is required, a certificate which testifies to a sound secondary education. Usually before teaching in communal colleges, necessarily before teaching in lycées, a "university degree," as it would be called in England, the degree of licentiate, is demanded; and this is a warrant of special proficiency in some one branch of letters or science. The picked men of the profession, who have charge of the classes in schools of the first rank, must possess the teacher's diploma of "agrégation."

We may now turn to the "training" of the teacher in the narrower sense of professional instruction in method. From certain public utterances of English educationalists it appears to be expected that in the French system there is much that is worth imitating.

In the preparation for the bachelor's degree there is absolutely no professional instruction. Indeed, it is not to be looked for, seeing that the baccalauréat merely puts an appropriate finish on a course of education in a secondary school and does not contemplate any specialization of function whatever. Moreover, for teachers it is really only preliminary to the licentiat. No doubt a large number, on the staff of colleges especially, have nothing more than this leaving certificate, but in great part they are répétiteurs, doing very little teaching work and themselves studying for some more valuable diploma.

It is more important to observe that in the preparation for the teacher's degree, that of licentiate, there is practically no professional instruction. The theory of teaching has no place in the syllabus and the question of method does not seem to be raised at all in the official programmes. The examination is purely a test of knowledge of subjects and not of educational theory or professional skill. There is one important reservation to be made, however, in view of a comparatively recent

development. This is the institution of university bursarships (*bourses de faculté*) with the avowed end of enabling more of those who devote themselves to secondary teaching to obtain the grades which will qualify them for higher posts. "The establishment of bursaries is specifically intended to supply men who have the degree of licentiate to those colleges which have none so qualified. \* \* \* The State wishes to aid especially those young people who, while possessing an inclination toward teaching, may be prevented from want of sufficient means from attending the lectures in the faculties." (Quotation from circular of September 8, 1879.) The bursarships are tenable for one year at a university center and are given usually upon examination. The number is restricted according to the probable requirements of the staffing of secondary schools. What is important from the point of view of the training of teachers is that special classes are held in the various faculties to prepare men for the licentiate; and to them are admitted not only the bursars, but also such *répétiteurs*, *maîtres d'étude*, *maîtres auxiliaires*, and *auditeurs libres* as may be free at the hours when the lectures are delivered. In a circular dated October 25, 1888, the success of the bursaries is stated with some natural satisfaction; they are now recognized as almost a "succursale" or branch of the higher normal school. In the same circular I find a full acknowledgment of the necessity of instructing teachers in secondary schools in the science of teaching. But nothing follows more than general recommendations. The university professors are asked to lecture upon the pedagogic aspect of their subjects and to talk familiarly with their pupils on questions connected with their future work. How far this general instruction leads the university professor to give hints on teaching his own subject will depend very largely on the amount of time at his disposal and on the idiosyncrasy of the professor. Moreover, the students are to visit lycées during school hours, when possible and where, in order to observe the methods and class management of the eminent professors who will be willing to admit them. Here again we have rather a counsel of perfection than a rule that can not be infringed. No hard-and-fast regulation has been made since 1888 for "boursiers de licence," and I understand that visits of observation or service in school with them is a matter of option. The possibility of such visits will naturally vary in the different centers according to the zeal of the authorities and the readiness of the professors in lycées to admit aspirants into their classes. In Paris, where the organization of professional training is more complete than elsewhere, though it is still in a rudimentary state, bursars reading for the degree of licentiate are not regularly sent into schools for practice and observation. It is highly improbable that provincial centers will be before Paris in this matter. There are courses of lectures on education at some university centers, at Paris, Lyons, Bordeaux, and Toulouse. In Paris they are given by M. Marion, the professor of the science of education; at the other places they are delivered as supplementary courses to the ordinary series on philosophy. M. Marion's lectures are partly public, when they deal rather with the broad questions of education in general likely to interest others besides teachers, and partly restricted to members, actual and prospective, of the teaching profession. Of the latter, one course is open to the boursiers de licence, if they like to attend. It is frequented by a mixed auditory consisting of teachers and aspirants of almost all grades, a very large proportion being primary masters and mistresses. There is no formal series of addresses, but a discussion of various educational problems treated now by the professor and now by one of the class. By the very nature of the case, questions connected with secondary teaching in colleges and lycées, especially detailed questions of method, can find very little place in the discussion. For boursiers de licence, then, destined probably to teach in colleges, there is provided, even at Paris, only such limited pedagogic instruction as may be picked up from general lectures on education and teaching and from possible visits to schools. It is but fair to add that many of these bursars, when they have got their degree, proceed with renewed bursaries to study for the *agrégation*, the pedagogic aspect of which may now come under treatment.

The professional training and testing, so much to seek in the preparation for the two degrees of bachelor and licentiate, appears in the *agrégation*. "The *agrégation*," we are authoritatively told, "is to furnish to the young professors an opportunity of showing their capacities in the way of erudition, as well as their fitness for teaching. \* \* \* It is of importance, then, to preserve its professional character." The examination for the title of *agrégé* comprises two distinct portions. The first, called the preliminary test, consists of written compositions of a very advanced order, but very rarely concerned with educational questions. The second, or final test, includes *viva voce* explanations of passages of authors, lessons, and practical exhibitions of teaching skill. As this is the nearest approach, so far, to a definite professional examination, details will not be out of place. In the *agrégation de lettres*, for example, there are three sections of the final test:

(1) The translation and explanation of passages from authors in Latin and Greek and comments upon a French text. The authors chosen are indicated a year beforehand, and hence no preparation is allowed for this test at the examination. "The candidates must offer all the remarks upon each text that explanation in class would call for."

(2) Explanation of a passage of Greek or Latin taken from the programme of secondary schools, with a literary and philological commentary. Twenty-four hours are allowed for preparation.

(3) A lesson of an hour on some subject taken from classical literature, the subject to be selected by lot from the syllabus of secondary schools. Twenty-four hours for preparation are allowed in this case also.

Similarly, in the *agrégation des sciences mathématiques* the final tests are:

(1) A lesson on "elementary mathematics," after three hours of preparation, without access to books or notes.

(2) A lesson on "special mathematics," after four hours of preparation under the same conditions.

Such tests as the foregoing at least imply that the candidates have devoted some personal reflection to the question of teaching. They further constitute a more or less definite acknowledgment of the necessity of pedagogic training for the secondary schoolmaster; but no light is shed on what means are taken to secure it. As a matter of fact, candidates for the *agrégation* are prepared variously, by private study, by one of the faculties where he is a boursier, and lastly by the higher normal school. As to those in the first category, who are probably employed in school work, their practical experience will serve in place of formal instruction. For the bursars, who enjoy their "*bénéfices*" on almost the same terms as the bursars for the *licencié*, there are the same facilities as these others possess—pedagogic instruction, if the professor sees fit to mingle with his lectures counsels on the methods of teaching (and many do this toward the end of their course), for some a short period of service in a secondary school, and, in those centers where provision is made, the liberty to attend special lectures on education. In Paris, boursiers d'*agrégation* in their first year are sent into lycées to watch and help, according to circumstances, the professors of the subjects they are studying. M. Marion, moreover, devotes a special series of lectures of an intimate character to candidates for *agrégation*, lectures in which theory is checked by the practice and observation just obtained in the schools. It used to be a condition of entering for the *agrégation* that a candidate, unless he came from the higher normal school, must have served five years in a public secondary in some capacity, and it was held that such a probation was enough to afford all the training in professional aptitude that was needed. In the most recent programme, however, I can find no mention of the condition, and conclude that, with the extension of the bourses de faculté, it has been suppressed.

It is on the higher normal school, *l'école normale supérieure*, that the attention of educational reformers in England has been chiefly fixed. As an impression seems to be abroad that the higher normal school itself is an efficient instrument for supplying and training all the secondary schoolmasters required in France, it is worth

while to describe the institution more in detail. To quote from an official document: "The higher normal school, established at Paris, is immediately dependent on the ministry of public instruction. It is intended to train teachers for the various sections of classical secondary education and of higher education in the establishments of the State. It comprises two main divisions, of letters and of sciences. The school takes none but boarders. Tuition and keep are free. Admission to the higher normal school is given after a competition which takes place every year. The number of places is fixed by the minister in accordance with the requirements of education." All pupils must bring a stamped document, containing a written undertaking to serve for ten years in some department of public instruction. The ordinary course of study lasts three years. The pupil must be a bachelor when he enters, and at the end of his first year he must gain the degree of licentiate. The second year in the section of letters is usually considered to be devoted to the disinterested pursuit of the higher branches of the study he has taken up; in the section of sciences, to the preparation for the licencié in another branch. In the third year all prepare more definitely for the agrégation, though, as there is issued no full and formal plan d'études for this examination, preparation for it must consist in profound research rather than in cramming. There is accommodation for over 100 pupils, and every year from thirty to forty are available for drafting into the schools. The intercourse in the classes seems to be of the most intimate description. The pupils are called upon to give lessons, especially in their third year, when the time of their entrance into the profession draws near. They are also to spend a fortnight in some lycée before leaving, a term considerably shortened from the six weeks that were originally required. The high opinion which the French have of this school—an opinion justly entertained, for from it have proceeded some of the most prominent savants of the century—must not prevent us from examining how far it comes up to the ideal of a training college for secondary teachers.

In the first place, the pupils of the higher normal school form an aristocracy among French teachers. Not every one can win the coveted dignity of agrégé, and still fewer can pass through the higher normal school. The thirty or forty who obtain admission each year are the pick of the lycées. As the numbers are so small, the normaliens can not supply all the places vacant in all colleges and lycées in France; and, indeed, they usually consider it a misfortune, if not an indignity, if they are not placed immediately on leaving in at any rate some important provincial lycée. Every lycée, it seems, counts among its teachers some one or two agrégés at least, and no doubt many of them are pupils of the higher normal school. But these elect persons gravitate to Paris after a period of service in the provinces, and staff very completely the numerous lycées in the capital and the immediate neighborhood. Much indirect benefit, no doubt, accrues to the schools in which they are placed by the dispersion of even so few highly trained young men through France; but the higher normal school can not be considered, as once it could, as the main recruiting ground of the secondary school teachers in France.

In the second place, the school does not pretend to be a school of pedagogy. There is apparently no study of educational methods as such, no investigation into the history of education, and no stress laid upon psychology in its bearing upon education. A priori, one would expect that the highest institute for training the best equipped teachers would form a school of educational thought and research to which the busy schoolmaster would refer for inspiration and guidance. But the object of the school is undisguisedly erudition and personal cultivation. "*Travailler pour soi, voilà l'essentiel à l'école.*" It is hardly concealed in public documents that admission to it is, as it were, an endowment of research, and panegyrists speak with enthusiasm of the possibility of working there for the pure love of study, untainted by any baser motive. The idea of applying the methods of professional training in vogue in the primary normal colleges to secondary schoolmasters, even in a modified form, is yet of too recent a growth in France to have affected the higher normal school. It is held that, given extensive learning and a complete mastery of the subject you

have to teach, the ability to teach it will follow, and M. Marion himself, who can not be accused of underrating the value of pedagogic instruction, is of opinion that to these "*jeunes gens d'élite*" a few hints and counsels are all that is needed. It can hardly be considered that the service in school of a fortnight and the giving of lessons occasionally in the third year constitute any serious pedagogic training, when there is no "master of method" to superintend the lessons and no regular formal lectures in psychology and the theory of teaching are delivered. The courses of the professor of the science of education, even so far as they are followed by the pupils of the higher normal school, are of too recent a foundation, and attendance is too much a voluntary matter for them to be said adequately to supply the deficit.

In the whole, then, the higher normal school, though a unique institution and admirably adapted for the purpose, hardly corresponds to our preconceived ideas of a normal school, ideas formed from an experience of normal schools for primary schoolmasters. It is, indeed, a *pépinière* or nursery, as it is so often called, where are reared professors for the greater lycées; and but as such, it trains and educates only the favored few. Some friendly critics accuse it of no longer completely fulfilling the functions for which it was originally intended, of supplying masters for schools in the secondary instruction. A certain proportion of its pupils have constantly been drafted into the higher university education. A small number, some half dozen or so, are regularly kept on as assistants and demonstrators for two or even more years, in order to enable them to prepare for their doctorate, and then pass into the chair of faculties. Others, again, go to the higher special schools, such as those of Rome and Athens, while some, though not doctors, are employed as assistant or supplementary professors in faculties. Even many of the bulk who do actually teach for a time in the lycées ultimately recruit the ranks of university professors. But as the object of the school is officially announced to embrace the supply of professors for the higher establishment of the State as well as the secondary schools, the criticism that the school is being diverted from its proper purpose does not seem to have very much value.

The masters of the elementary and primary divisions of a secondary school may now be considered. As above stated, the instruction in the divisions resembles primary instruction, with the important exception that a modern language is begun. The classes in the primary classes are generally under the charge of regularly trained primary-school masters and mistresses drafted for this purpose into secondary education. It may not be out of place to remark that their training involves a three years' residence in a normal school, with regular lessons in pedagogy, a regular system of service in a practicing school. For elementary classes in communal colleges the certificates of a primary head master are required, i. e., the higher *brevet* won in the ordinary course of things at the end of the third year of the training college course, and the "*certificat d'aptitude pédagogique*." It would seem that the regulations for the staffing of the lower division have not yet reached their final form. A comparatively new certificate, that of "fitness for teaching elementary classes," is demanded of those who wish to be full professors of elementary classes in lycées. It is at this certificate that *maîtres d'étude* with no ambition for a higher degree than that of bachelor and acting professor of lower classes chiefly aim. It is through it also that capable men pass from primary into secondary instruction, though there is very small hope of their rising above the elementary classes. Whether it be that the programme was inspired by those who look upon pedagogic instruction as important, as its recent origin suggests, or its framers had the theory that the less cultivated a master the more is *pédagogie* required; at any rate the syllabus contains sufficient of the professional element to satisfy the most exacting. The written work includes compositions in the form of lessons in French, history and geography, sciences and mathematics. The oral work comprises a *viva voce* explanation of a piece of French, a lesson of twenty minutes on composition and the formation of sentences at the blackboard, a lesson of a quarter of an hour on geography, and another on history, also at the blackboard. Similar lessons on sciences and mathe-

matics, and finally a personal examination on "the elementary principles of pedagogy." A quotation from the report of the board of examiners in 1892 will be useful in view of the last oral test. "The questions are chosen among those which should be familiar to a good professor of elementary classes; they refer to the theory of education as well as to the methods of teaching; they bear upon the interpretation of the syllabus and the government of a class. We choose them in advance, and the candidates draw them by lot. When] the questions have been treated in due form, they are followed by observations from the examining board, which corrects mistakes and clears up obscure points." There is no provision for preparing candidates for the certificate; such preparation must all be private. The fact that not much more than 10 per cent of the candidates are passed indicates that the certificate is to be made as valuable as possible. The benevolently earnest anxiety that the professor shall know how to teach his class contrasts strongly with the almost entire absence of any such precaution in the case of candidates for the *licenciat* and its comparative neglect even in the *agrégation*.

One other certificate calls for a passing notice in a study of the training of French teachers. As the *licenciat* is a necessary preliminary to the *agrégations* of letters and sciences, a "certificate of fitness for teaching modern languages" was established to stand in the same relation to the *agrégation* of modern languages. The possessor of the certificate may take provisional charge of a class in a *lycée* and full charge in a communal college. The examination does not necessitate a knowledge of Latin and Greek, and for this reason is often undergone by modern language tutors in primary normal schools. Among the conditions occur some which are of interest from a pedagogic point of view. A lesson is to be given in grammar in the modern language chosen. One of the written tests is a composition in French on some subject connected with the "special pedagogy of modern languages." I give a few examples of the questions and subjects. "What system of declension (in German) have you adopted in your classes, and why?" "Pronunciation and accent in a modern language class." "The teaching of modern languages by the ear as opposed to teaching by the eye." "Expound in a general manner the method which seems to you the best for teaching the vocabulary in Spanish." Although there is no training school for modern languages, this emphasis laid upon the theory of teaching them can not fail, by causing candidates to reflect on their methods and to collect information, to increase the educational efficiency of the classes.

Hitherto I have concerned myself with the ordinary or classical *lycées* and colleges. With appropriate alterations all that has been said is true of "modern" schools and the "modern sides" of classical schools—"special secondary instruction," as it was until recently called. There is a *baccalauréat* at the end of the full course at one of these schools of relatively the same difficulty as the classical degree. There has been also, besides the degree of *licentiate* in sciences, a special "certificate of fitness for teaching in modern schools," and a special order of *agrégation*. There was even a separate normal school (*l'école de cluny*) to train professors for the *enseignement spécial*, and a certificate for those who had passed through it. The school was suppressed a few years ago, and now from 1894 onward the peculiar certificate and *agrégation* are also abolished. These measures do not constitute a neglect of the "modern" education, but rather an elevation of it; for the substitution of the scientific degrees and diplomas of the professors of classical *lycées* will be a better guaranty that modern schools shall have a staff of cultured men than a general examination in modern subjects, such as qualified for the old certificate of fitness and the old *agrégation*.

*Lycées* for girls require to be considered apart. They are strongly differentiated from *lycées* for boys by the three facts that they were instituted so recently as 1880, that there was no staff of teachers already trained, and that in the curriculum Latin and Greek are omitted. Among other results following from these differences, the girls' schools and teachers need much more direction and guidance, as there is no tradition of teaching such as exists in boys' schools. In outline, the conditions of admis-

sion to the professorat are the same as for men. The leaving certificate of a girls' secondary school is the equivalent for the bachelor's degree, and it is noteworthy that instead of it a certificate from the primary normal school is accepted. Instead of the degree of licentiate, which involves a knowledge of Latin and Greek, there is substituted a "certificate of fitness for the teaching of girls." The examination for it includes a lesson on history of half an hour's duration, to be given after a preparation of two hours; but this is the only pedagogic test. The certificate admits the holder to be chargée de cours only; to be full professor she must be agrégée. In the agrégation, which is divided into two parts, for the order of letters and for the order of sciences, respectively, professional tests have a larger place than in the corresponding competition for men. Thus, in the agrégation of letters, besides an oral explanation of a French text, there are three lessons—on history, on geography (with a sketch on the blackboard), and on morals. Moreover, a devoir, or pupil's exercise in literature or grammar, is to be corrected orally before the board of examiners. Occasionally in the written work essays are set on educational subjects.

As the recruiting of the professorate of girls' schools is still, so to speak, nursing, in the reports issued by the examining boards advice is freely offered to the aspirante on the method of giving the lessons, and admirable counsels are bestowed with the avowed object of "coaching" those who shall appear as candidates in the future. Most of the agrégées come from the higher normal school for women at Sèvres. This establishment, which was created in imitation of the school for men, differs from the latter in many respects. As the lycées for girls are not as yet by any means so numerous as those for boys, the training school is able to supply professors for vacancies to a far greater extent than in the higher normal school at Paris. Again, although the agrégation is by no means to be despised, it is not so hard, absolutely, as the agrégations for men, and as there are only the two orders of letters and science, the specialization of the men, and consequently the profounder study of a more limited range of subjects is naturally out of the question. Thus the school of Sèvres is not liable to many of the criticisms which may be fairly leveled at the higher normal school at Paris. I can not discover that more attention is paid to educational methods and theory than at the other school; the facilities for attending the lectures of the Sorbonne on education are certainly far less. In the matters of conditions of admission, length of residence, terms of residence, and the engagement to serve in some department of public education the normal school for men is closely imitated. It is worthy of remark that while the men undertake to serve ten years simply, the women have an alternative form of engagement to complete the term of ten years originally promised in a primary training college. Many primary schoolmistresses do, as a matter of fact, pass into secondary education by this and other means. The higher normal school at Sèvres and the higher normal school at Foutenay-aux-Roses for training mistresses in primary normal colleges are often associated together. There is no essential difference in their respective programmes. But to compare the higher normal school at Paris with the normal school of St. Cloud for training tutors for primary normal colleges is out of the question, so radically different is men's secondary education from men's primary education. There is in the above indications sufficient evidence that on the side of the girls a much closer connection exists between primary and secondary education.

There is one more point which deserves emphasis. It might seem from the description of the professional training of the teachers in French secondary schools that after all it is confined chiefly to masters of elementary classes and women teachers, and even then it is restricted to private work tested by an examination; that in other cases it is casual and accidental, and that the great mass of teachers apart from the pupils of the normal school must be left without guidance except such as is supplied by their native intelligence. But to think so would be to lose sight of an important characteristic of French education in general, the abundance and fullness of programmes, and the extreme care with which they are drawn up. Whatever evils may be involved in strict organization, and however mechanical and arbi-

trary some of the arrangements may seem, they have the advantage that they help the young professor in the outlines of his work and prevent him from wandering into indefiniteness. This is of more value because the head masters of lycées and communal colleges are not usually counted on the teaching staff; they have often done no teaching, and so can not assist a novice as an English head master who has probably mapped out the course of work for himself can assist a beginner. I do not discover that the programmes prescribe too minutely what is to be done by the teacher, but to the untrained learner a little guidance is useful; and the directions of the programmes, coupled with the consultations in the "masters' meetings," recently made a general custom, will save many an error. Perhaps also the fact that the syllabus is uniform for all public schools throughout France, fatal as it may seem to all individual and local developments unless there be a liberal interpretation of the regulations, will help rather than bewilder a man who has himself been educated in a school similar to that in which he teaches and on lines very similar to those on which his pupils are being taught. In many cases not only is the syllabus carefully drawn up, but advice is given how certain lessons should be conducted. There is constant emphasis, for example, on the necessity of avoiding merely verbal teaching in science and of using visible objects and specimens. Excursions to illustrate the courses of geology and botany are recommended. In arithmetic the exact point at which theoretical teaching should be introduced alongside of the practical teaching is carefully indicated. In the syllabus for girls' schools a whole page is devoted to directions for teaching to read aloud. I should not omit to mention an admirable volume of instructions and counsels which was issued to all masters upon the publication of the revised syllabus of 1890. The book is a finely written treatise on the outlines of teaching methods, and it deals with every department of the work in a secondary school. What lends an additional value to all these instructions and programmes is that they are compiled by an educational council of experts, and not by a "department" of administrative officials. The council represents every educational interest and every grade of teachers in France. The minister of public instruction issues his decrees in conformity with the council's advice. The constitution of this body lends dignity to the teachers who are represented, and they have the satisfaction of knowing that their work is mapped out for them by men on whose wisdom and experience they can rely.

The military question has had considerable influence on the supply of primary schoolmasters. Before 1889 they were exempt from military service, and when the exemption was removed the necessary motive to decide many who wavered before entering on a career so little remunerative ceased to operate, and the numbers of candidates for the primary normal schools fell considerably. The same effect has not followed in secondary education. The degrees and diplomas which bar the entrance to the higher grades of the teaching profession acted before 1889 as sufficient impediments to any who desired to take up the work merely in order to avoid the year under the flag. Secondary teachers have been rare on exactly the same level as members of the other profession in regard to military service; under ordinary circumstances they must devote one year to military training.

A few remarks may be made by way of summary and conclusion. As compared with the state of things in England, the existence of a system of supplying teachers to secondary schools calls for comment. The care with which the terms of admission to the profession are drawn up, with their safeguards and checks and guaranties, can not but excite our admiration; for to have the methods of entrance so well organized is no small security for efficiency in education. If a man enters with his eyes open, knowing clearly the conditions under which he will serve and be promoted, he is much more likely to prepare himself for the work and to equip himself with everything that can make it successful. The deliberate choice of teaching as a career which is almost demanded by the French system must produce the most beneficial effect upon education; while if men drift into the profession or take it up

until something better offers, no enthusiasm and scarcely honest and thorough work can be expected.

There is little to find fault with in the intellectual training of the future professor. The first requirement for a higher teacher is a sound secondary education and for a lower teacher a superior primary education. The distinguishing feature of both, as compared with their English equivalent, is the prominence given to the mother tongue and its literature. The second requirement in all but the lower teachers is some specialization. As the functions in all but the smallest colleges are themselves specialized, the teachers must be prepared accordingly. Hence the subdivisions of the licentiate's degree, and the eight orders of agrégation. In all departments the teacher must have thoroughly mastered the subject he is to teach, and even, if possible, be an expert in it. One result of the specialization, as Mr. Arnold notices, is that it seldom happens that a teacher has to take a subject with which he is not familiar, and this must minimize the amount of inferior teaching. Much as we may admire the intellectual training of the secondary teacher in France, it must be confessed that the professional training is disappointingly ill-organized. That it is inadequate is conceded by those who are the most earnestly seeking to remedy its defects. There is indeed some testing of skill in teaching by examination; but little provision is made that the candidate shall have been properly instructed. And as to the testing itself, there is the strange paradox that it takes place at the top and bottom of the hierarchy of teachers but not between. The distinguished agrégés are tested and so are the humble elementary masters, but for the average licentiate—that is, for the average professor in communal colleges and provincial lycées—there is not even a test for which he might prepare by personal reflection or investigation. In the primary system all masters and mistresses must pass through the normal school. In the secondary system this is neither necessary nor possible. Comparatively few enjoy the privileges of university preparation for the agrégation, and fewer still can enter the normal school. And even in the normal school itself there is very little professional training. The ardor of the students is directed toward purely intellectual pursuits. We do not, perhaps, expect that the normalien should have a dreary apprenticeship, but we do look for more attention to educational methods at so renowned a training center. The truth is that, coupled with a genuine conviction that the more cultivated a teacher is the less he needs of formal instruction in method, there is a prejudice against *pédagogie* as applied to secondary schools. Pedagogic instruction is well for the less cultivated primary schoolmaster or lower-form master, but it is beneath the dignity of the *professeur de lycée ou de collège*. The prejudice has led to the failure of some attempts to introduce lectures on education at university centers. There is now a distinct tendency in the opposite direction. Some of those in high places, like M. Compayré, the rector of the Academy of Portiers, are known to be advocates of a science of education and the university courses that have been started, though attendance at them is compulsory upon none, have justified their existence by the considerable auditory they have attracted. It seems likely that the French love of organization will set to work here too, and that before long it may be true, not only of picked teachers, but of the professor as a whole, that they are "thoroughly trained and tested."

# MEMORANDUM UPON THE REGISTRATION AND TRAINING OF TEACHERS IN SECONDARY SCHOOLS IN THE STATES OF THE GERMAN EMPIRE.

[By Mr. J. J. Findlay.]

## ANALYSIS.

PART I.—Mutual relation of the States of the German Empire as regards higher education (§1). Three classes of secondary schools (§2). The principle of "recognition" by the State; the value of a fixed "standard of attainment" for the various classes of "recognized" schools (§3). Recognized schools must only employ certified teachers (§4). Importance attached to this recognition in the civil and military services—effect upon parents and upon teachers (§5). Possible harm to education arising from the all-powerful influence of Government deplored by school reformers (§6). State control in Germany is exercised without resorting to schemes of "simultaneous" written examinations (§7).

PART II.—*Teachers' certificates.*—(§8.) The Prüfungs-Kommission. A. Course of general education, commenced in the school (gymnasium) and continued in the university. The candidate must aim at complete mastery of some one branch of knowledge; he must also have learned something of philosophy and of education (Pädagogik) in relation thereto. B. The examination: No account taken of a university degree. C. The subsequent course of practical training.

PART III.—*The teachers' training.*—Opportunities of training during the university career, in connection with a few universities. (Note on the term "Seminar.") Service to research rendered by the university seminars. Difference of opinion as to their value (§9). Legal requirements relating to training (§10).

I. The probefahr.—It has proved to be unsatisfactory (§10).

II. The royal pedagogic seminars of Prussia.—Most of them since 1880 (§11).

III. The new gymnasial-seminars and the new compulsory law in Prussia. a. Seminar-jahr added to the former probefahr. Official regulations for the conduct of a gymnasial seminar. Its advantages as contrasted with training at a university (§12).

IV. A combination of methods in vogue at Jena avoids the defects of the Prussian plan. Does the presence of a gymnasial-seminar injure the gymnasium with which it is connected? Opinion of Hofrat Professor Richter (§13).

Summary of results obtained from German experience.

Other classes of teachers employed in secondary schools: a. Primary teachers. b. Visiting masters (§14).

Overproduction of trained secondary teachers (§16).

Training of women teachers and of teachers for special schools (for the blind, for commerce, etc.) (§17).

NOTE.—The only book to which reference is made is the following annual publication: Statistisches Jahrbuch der höheren Schulen Deutschlands, Luxemburg und der Schweiz (Part I, Prussia; Part II, The rest of Germany, including Switzerland). XIVth year. Leipzig: B. G. Teubner, 1893; 3.50 m.

§ 1. It is important to observe at the outset that while each of the German States is independent of the rest for the purposes of public instruction, practical considerations make it necessary that the smaller States should follow the lead of the latter in some important particulars; thus the recent reform in the training of secondary teachers originated by Prussia<sup>2</sup> has been at once copied by some of the smaller States, because they can only enable their students to become eligible for posts in Prussian schools by giving to them a training which the Prussian ministry of public instruction will accept as adequate. Further, the imposition of compulsory military service has brought with it the law of exemption, which releases every boy who attains a certain standard<sup>3</sup> at a higher school from two out of the three years of service. This law prevails in every State, and therefore imposes a certain amount of uniformity in standards and in modes of inspection.<sup>4</sup>

Thus, while the independence of the various States permits of a good deal of variety in method and practice, there are tendencies at work to produce uniformity, so that it is possible in general terms to describe "German" methods and to speak

<sup>1</sup> From vol. 5 of Report of Royal (English) Commission on Secondary Education.

<sup>2</sup> See § 12 below.

<sup>3</sup> So called "Einjährigenexamen." Since writing the above the three years of service have been reduced to two, and thus the burden of this examination is not now so severely felt (August, 1895).

<sup>4</sup> See Statistisches Jahrbuch der höheren Schulen, pp. V and VI, 1893-94 (B. G. Teubner, Leipzig). I refer below to this work as Stat. Jahrb.

of a "German system" of education, although deviations from the general plan may often present themselves. Further, this general system may be regarded as reaching over a wider area, beyond the German States themselves. Austria, Switzerland, Norway, Sweden, and Holland all present features closely allied to the kind of organization that we find in Germany proper.

§ 2. The registration of the teacher involves the registration of the school; the State's relation to the former is, in Germany, determined by its relation to the latter. If we classify secondary schools according to the nature of their government, we have, roughly speaking, three kinds:

(a) Government schools, maintained and directed wholly by the "ministerium."<sup>1</sup> These are very often old endowments, analogous to our English grammar schools. They are administered very much as a State department; the head master and his colleagues are appointed by the ministerium, and regard themselves in many respects as civil servants.

(b) Municipal and guild schools, founded or conducted by some local authority. These comprise most of the schools of a more modern type: Realschulen, technical schools, or high schools for girls—arising out of the local needs of the neighborhood. They are very often subsidized by the State as well as by local funds, and the subsidy, of course, carries with it the obligation to accept Government regulations; among others, those relating to the employment of certified teachers.

(c) Private schools, the property of a private individual (the type of school supported by a commercial company, so common in England, is never met with abroad).

It is sometimes supposed that private school education is unknown in Germany, but this is an error. There always have been a large number of institutions, both boarding and day schools, in private hands, and it is held, by educational reformers as well as by State officials, that their existence, under proper supervision, is a benefit and not an evil.

§ 3. The principle upon which the Kultusministerium in German States relies, in controlling schools which it does not actually administer—(i. e., schools in classes *b* and *c*)—is to give a valuable official recognition to institutions conducted according to rules and methods of which it approves, and to refuse this recognition to such institutions and teachers as choose to remain outside—a recognition so highly appreciated that it compels all good schools for boys to seek it, and no teacher ventures to embark upon his calling without reckoning with it.

To facilitate this recognition, a well-understood standard of attainment is in vogue for the various classes in each type of school understood by parents and the public generally, as well as by teachers and officers. Just as in England we understand what is meant by a boy being in the sixth form of a good public school, so in Germany the first class, second class, etc., represent fixed standards of attainment, to which all schools must conform, if they seek public recognition, and the ministerium holds itself responsible for seeing that these standards are maintained.

Two questions arise: (1) How does the ministerium satisfy itself as to the maintenance of those standards? (2) What is the nature of the public recognition—the inducement offered as a reward to the school for maintaining it?

§ 4. The ministerium lays down rules, similar to those with which we are familiar in England in the case of primary education, relating to the warmth and ventilation of schoolrooms, the limits to the numbers permitted to be taught by a teacher, and (what mainly concerns us here) the requirement that the classes shall be taught throughout the day by teachers recognized by the ministerium as qualified to give the instruction, and paid a salary on a par with that paid for similar service in Government schools<sup>2</sup> (Class *a* above). And the instruction given by teachers must be heard by inspectors from time to time.

<sup>1</sup> Every State has a department of public instruction, usually associated with that of public worship. See *Stat. Jahrb.*, I. VII-XVIII. II, 2, 242, etc. For each province of Prussia there is also a "Schul-Kollegium."

<sup>2</sup> Information as to salaries is found on pp. xxv, etc., in *Stat. Jahrb.*, and elsewhere; pensions, etc., on p. 951.

Again, the time-table of the school must be submitted to the ministerium as evidence that the school is fulfilling the programme which its description imposes upon it.

And, finally, the highest forms of all secondary boys' schools are examined for the sake of awarding leaving certificates (*Reifezeugnisse*).<sup>1</sup> The examination is mainly conducted by the staff, but an inspector supervises the work, both oral and written.

§ 5. The recognition offered by the Government as an inducement arises from the value attached to these certificates; they are essential to the future progress of any boy who seeks employment in the civil, military, or naval services.<sup>2</sup> The various branches of these services are filled not, as with us, by competitive examinations, but by selection out of candidates who have the proper "*Berechtigung*" from a school, showing that they have passed through their classes with credit. The example of the Government is followed largely not only by corporate bodies but by private employers of labor, for public opinion in Germany is only too prone to exaggerate the value of school instruction.

Hence we may summarize the attitude of the State as follows:

To the parent it says: "We do not positively forbid you to educate your children ill; you may, if you will, put him to a school of which we do not approve, and so long as he is not scandalously ill-taught we shall not actively interfere; but he will lose all the benefits that we attach to education of which we do approve, he will not escape three years' service in the army, he will not be admitted to a university or politechnikum, and he will not be eligible for Government employment."

To the intending teacher it says: "We do not compel you to seek our certificates or to undergo the prescribed course of professional training, but if you remain uncertificated you will only be able to teach children whose parents renounce the advantages which we offer. You will be able to teach neither in a Government school nor in any municipal or private school which works under our recognition; almost your only chance of employment will be as a private tutor or in conducting a school for the children of foreigners."

§ 6. Two observations will here be in place.

Opinion in Germany is unanimous as to the advantage which the country has secured from this method of control; indeed, a German can scarcely understand how any other country should be without it; but there are not a few protests from educational reformers against the uniformity with which the ministerium in most of the States (and, above all, in Prussia) imposes its views about instruction upon teachers so as to prevent progress in pedagogic research. Naturally enough the State official is inclined to regard the existing state of affairs as satisfactory; the reformer, on the other hand, considers every branch of school work as open to revision, and deplors the fetters by which the teacher's initiative is restrained; the teacher, as a trained professional man, ought to be trusted within somewhat wide limits. I think there is sufficient evidence in favor of the reformer's opinion; it is certainly true that the present generation has seen no pioneers of educational thought working out their ideas and ideals into practice. The band of teachers who were inspired first by Rousseau's "*Emile*," and then by Pestalozzi, seem to have few successors.<sup>3</sup> Fröbel was the last of them; and the education departments of the German States have done their best to drive the kindergarten out of Germany. The rigidity of school law has made independent research almost an impossibility, and yet the progress of pedagogy seems to be as dependent as other sciences upon practical experiment; there is a great expenditure of energy in thinking and in writing upon the whole field of teaching, but little progress is made, except within the circle where the teacher is permitted a free hand. True, this circle is wider than that within which the edu-

<sup>1</sup> Stat. Jahrb., p. 950, etc.

<sup>2</sup> Stat. Jahrb., p. 950 (1-4).

<sup>3</sup> The only centers where freedom in research can be properly conducted are the one or two universities where practicing schools are maintained independent of State supervision. The leaders in this movement are all Herbartians; hence the line of educational reform in Germany has followed the lead of Herbart and Ziller.

cation code<sup>1</sup> allows the primary teacher to move, or than that within which tradition and the authority of the universities have bound our secondary schools; nevertheless, the teachers of Germany are justified in their complaint that important sections of their professional work are excluded from investigation by the deadening weight of State administration.

§ 7. Secondly, it should be noted in passing that the entire system of school inspection, involving the maintenance of uniform standards throughout the whole country, is conducted without introducing the evils of simultaneous written examinations, which in England have done so much to destroy the efficiency of teaching, but which we find it so difficult to dispense with. The system, especially that part of it which deals with exemption from military service, does bring with it some of the evils of overpressure and of "cram"; but the German schools are not troubled by the requirements of elaborate examination regulations leading up to papers of questions set by external authorities, who have no knowledge either of the teacher or of the school. Indeed, until a boy comes to his last year of school life he does not come directly under the eye of external authorities at all; the *direktor* and *lehrercollegium* of his school, subject to the occasional inspection from the ministerium, are trusted to carry out their work in a professional spirit. Anything like serious inefficiency or breach of trust is readily exposed in a school community, which has close relations not only to Government, but to a multitude of families jealously anxious for their children's intellectual progress. I make this observation because I believe it to be possible in this country also to introduce efficient control over our secondary schools, without burdening either pupils or teachers with new schemes of simultaneous examinations.

§ 8. Teachers' certificates.—The requirements described above (that every class in a recognized school shall be taught in every branch by a teacher certified as competent for the purpose) imposes upon the ministerium the duties of registration, and for this purpose every German State and each of the provinces of Prussia has its examination committee (*Prüfungs-Kommission*),<sup>2</sup> consisting partly of professors, partly of State officials. This commission takes charge of the candidate from the time when he first presents himself until he has passed through his course of training and is finally certified as "*Oberlehrer*."

The regulations may be distributed under three heads:

A. Course of general study, previous to entering upon professional work. The candidate's papers must show—

(1) That he has been educated in a first-grade school,<sup>3</sup> gymnasium, realgymnasium, or oberrealschule, from which he has passed with credit as a student in a German university.

(2) That he has spent at least three years in study at one or more of the German universities.

NOTE.—Most candidates spend four, many five years, before presenting themselves for the test. Teachers are now petitioning to be permitted to spend part of this time at foreign universities, for the sake of a wider general culture, as well as for the acquirement of modern languages.

(3) That his studies have comprised—

(a) Some special branch of scholarship in which he desires to be certified as competent to give the highest instruction, and one or two branches allied to this.

Every teacher is certified not only as generally competent but as especially qualified in certain branches. Thus one master on a staff may be certified to teach Latin and Greek up to the highest classes, and French up to *tertia* only; another, mathematics up to *prima*, and chemistry and physics up to *tertia*; both of them being also certificated as "*form masters*" (*Klassenlehrer*), since they are compelled to qualify also in the branches mentioned in the next paragraph.

<sup>1</sup> Of England.

<sup>2</sup> Stat. Jahrb., pp. viii-xviii, Part B, pp. 240-242, etc.

<sup>3</sup> Stat. Jahrb., Part B, p. 950.

(b) Religion, philosophy (ethics and psychology), education,<sup>1</sup> history, and literature of the Fatherland.

These branches are not imposed as part of the candidate's general education, but as a part of his professional training. The general education<sup>2</sup> of the teacher is concluded when he leaves the gymnasium and enters the university, precisely as is the case with the student of medicine or of law. We may note, therefore, the special reasons which lead the ministerium to impose these selected studies upon all candidates.

Religion is required, owing to the special relations in which the state stands to the church. The kultus ministerium is at the same time the ministry of public worship in most of the States. The examination is always of a serious character, and involves laborious preparation.

Philosophy and education, unless offered by the candidate as a special study, are tested more generally. The candidate is expected to understand the elements of ethics and psychology as a foundation for the studies in education which he will pursue in greater detail presently. He is expected to have used his opportunities to hear university lectures on *pädagogik*, especially in its philosophical and historical aspects. Courses of this character have been given almost everywhere by professors of philosophy since the days of Kant and Wolff. If the candidate shows a special interest in the subject, it will in some States be to his advantage; in others it will not, for many influential men distrust the theoretical presentment of educational doctrine by professors who live apart from the school. A candidate, however, who had wholly neglected the subject would be in danger of rejection, and he would never satisfy the commission if he proved to be unacquainted with philosophy.

The history, geography, and literature of Germany are required of all candidates for a reason analogous to that which requires religion; the foundations of patriotism and civic duty are to be laid in an accurate knowledge of the history and the thoughts of the German people.

The candidate has already shown a knowledge of this subject, as well as of general history, ancient and modern, in the leaving certificate which he has brought from the gymnasium, but this is not considered sufficient for the teacher without a more detailed study of the nation's fortunes.

Here concludes the course of professional study which the candidate must undertake before he presents himself to the commission.<sup>3</sup>

B. With certificates showing that the candidate has passed through this course of study, he presents himself for the "*Staatsexamen*," which is conducted by members of the commission, or, in part, by professors whom they may nominate for the purpose. The examination is partly oral, partly it consists of theses written by the candidate to show that he has done some independent thinking on the lines of his special studies; very usually a candidate will also be given a subject on which he will be bidden to produce an essay within forty-eight hours, giving his word of honor that he has written it without assistance except from books. It should be noted that some of the examiners are already acquainted with the candidate before he presents himself for the *Staatsexamen*. The professors on the *Prüfungs Kommission* are teachers in the university where the candidate has pursued most of his studies; he has attended their seminary, and they have advised him and watched his progress.

Finally, this *Staatsexamen* takes no account of the university degree. Teachers are placed on exactly the same footing as clergymen, medical men, or lawyers—each must pass his *Staatsexamen* before being permitted to practice. If they choose, they can also present themselves before the philosophical faculty of any university in Germany for the doctor's degree, and teachers usually do so, for the examination is

<sup>1</sup>*Pädagogik*.

<sup>2</sup>So far as the State regulates it. It is, of course, recognized that the university student is gaining general culture as well as technical training during his university career.

<sup>3</sup>On sending in his name as a candidate he must forward the whole set of certificates to the office of the *Prüfungs Kommission*.

not so severe as the Staatsexamen and covers similar ground. If an Oberlehrer is found without the title, the omission is due to poverty, for the expenses in fees are considerable; while, however, the title is sought for the sake of social and academic distinction, it is ignored by the law; the universities are not authorized to confer benefits beyond those that properly fall within their province as an academic society.

C. Having passed this examination, the student is admitted to a course of training as a "Schulamts Kandidat."

§9. *The teachers' training.*—Hitherto the student has not been compelled by law to interest himself very seriously<sup>1</sup> in education; his main attention has been devoted to "liberal" studies—classics, mathematics, or modern languages, as the case may be. But it is important to notice that students who take a special interest in Pädagogik have opportunities for pursuing their inquiries during their university career. The liberty allowed to the German undergraduate of keeping terms in any German university enables such men to go to Halle, or Leipzig, or Giessen, or Jena, in each of which universities elaborate arrangements are made for "practical" training in school classes, associated with courses of university lectures. There are professors of pedagogy in these universities who have charge of a school, or of classes in a school, where students can teach under supervision. At Leipzig and at Giessen the professor is also head master of a large gymnasium;<sup>2</sup> at Jena he is given charge of a small practicing school conducted by his assistants solely for the purposes of pedagogy, while at Halle a so-called Pädagogium has been in existence since 1700 as a part of the great Franckesche endowment. In other universities a professor of philosophy will frequently give a course of lectures on pädagogik, and may also conduct a "theoretical" seminar<sup>3</sup> for the study of the subject by means of papers and discussions, but in these four universities a "practical" seminar is arranged, of which criticism lessons form a part, and in which the whole range of school work is brought under review.

These "practical" university seminars have played an important part in the development of higher training. Firstly, they have maintained the close association between pedagogy and philosophy. Training readily tends to be reduced to a system of rules-of-thumb, put together from the limited experience by busy schoolmasters, and to neglect the wider and more permanent issues to which a right presentment of education must always appeal. Now, in a German university both professor and student are free to contemplate the field at leisure, with less regard to the exigencies of the moment, independent of Government codes or State inspectors. It was in such a seminar that Herbart, when he succeeded to the chair of Kant at Königsberg,<sup>4</sup> gathered round him the band of students who have developed his ideas into the science of education as it is understood in Germany to-day.

Secondly, they have been pioneers, working out by experiment the problem with which we are here concerned, as to how young men may best be trained for the work of higher teaching; they have attracted the promising undergraduates who in later life have become either distinguished head masters, directing gymnasial<sup>5</sup> seminars or have served as directors of primary training colleges.

Now many university professors are of opinion that the whole business of higher

<sup>1</sup> See §8, above.

<sup>2</sup> See below, §13.

<sup>3</sup> Note on the term "*seminar*."—The word is used in two senses, which have to be kept distinct.

1. In a university a seminar is a weekly meeting such as all professors conduct with their best students to stimulate discussion and independent investigation.

2. The term is also used to describe training colleges for teachers, whether day or boarding.

Thus: Lehrerseminar = Primary training college.

Gymnasialseminar = Training college for secondary schoolmasters connected with a gymnasium.

A training course conducted by a university professor of pedagogy (Ein pädagogisches Universitäts-Seminar) partakes of both characters.

<sup>4</sup> 1809-1833.

<sup>5</sup> See below, § 12.

training ought to be conducted on this model: Establishing chairs of pedagogy, with practicing schools attached, in every university. Other professions—medicine and law—look to the university for practical as well as theoretical training; why should it not also serve for the teaching profession?<sup>2</sup> Their argument is strengthened by the development of university activity which recent years have witnessed; not only are medical and dental students provided with “practical” seminars, associated with hospitals and “cliniks,” but natural science students and students of agriculture have now their laboratories, all directed by professors in “practical” seminars.

On the other hand, the prevailing opinion among head masters is that the “practical” side of training can only be imperfectly undertaken by a university department, and that the detailed study of school practice should be delayed until the student has closed his university career. The question can not be regarded as finally settled, but for the present the action of Prussia in 1890<sup>1</sup> has opposed the professorial view; the work done in the four universities will no doubt develop and is likely to be imitated elsewhere, but in the eyes of school law it will continue to be regarded as affording opportunities to the best men rather than as a plan on which the mass of teachers are to receive training. In what respects, then, is higher training a matter of compulsion and not of choice?

#### § 10. The legal requirements relating to training:

I. *The Probejahr*.—For more than fifty years every intending teacher, after passing his Staatsexamen, has been sent to a gymnasium or other secondary school for a trial year, called the Probejahr.<sup>2</sup> He is not paid any salary, but is attached to the staff, teaching for a few hours every week and learning what he can from the head master and his colleagues. During the year he produces a few pedagogic theses and is expected to acquaint himself with the work of the various classes of the school, and particularly with those branches of instruction in which he is certified as a scholar.<sup>3</sup> At the close of the year a report upon his progress is submitted to the Prüfungs-Kommission by the head master in conjunction with the staff (*Lehrerkollegium*), and he is then certified as “*Oberlehrer*.”

This year of trial has been more or less useful according to circumstances. Under a headmaster of ability, ready to take an interest in training, the Probejahr might be of the greatest benefit; but very often the Probekandidat has learned little more than if he had been put to full work with full pay. True, he has had the benefit of looking round upon every department of school work, and the head master has the responsibility of giving him hints and of putting him into the ways of the place, but very little has come of the plan, and dissatisfaction, with its results, has always been felt. It has had, however, one great advantage: If a young man is a hopeless failure the head master and staff refuse to recommend him at the year's end, to the mutual advantage both of the candidate and of the schools.

This Probejahr may then be regarded as the first step in the development of an efficient system of training on the “practical” side, and it represents the low-water mark of achievement in the German States. Several of the German States have for many years made better provision. Thus, in Hessen and in the Kingdom of Saxony, where there exist universities<sup>4</sup> above alluded to, with a chair of pedagogy and a “practical” seminar, the ministerium has compelled students to join this seminar for one or more terms, either before or after passing the Staatsexamen.

#### § 11. The Royal Pedagogic Seminary in Prussia.

II. In Prussia another method has been adopted which has provided training for about seventy students. Twelve institutions, called *Königliche Pädagogische Seminare*,<sup>5</sup> have been founded with scholarships (*stipendia*) to assist students who attend

<sup>1</sup> Described below, § 12.

<sup>2</sup> The Probejahr is described by Mr. Storr in his evidence before the House of Commons committee on the teachers' training and registration bills, 1891, pp. 131, 132 of Special Report.

<sup>3</sup> Pp. 117-119, above.

<sup>4</sup> Leipzig and Giessen, above referred to; for Giessen see *Stat. Jahrb.*, II.

<sup>5</sup> *Stat. Jahrb.*, XVIII-XXI.

them. Most of them were established or reorganized about 1880, when the feeling of dissatisfaction with the Probejahr began to be widely felt. These seminars consist of a director and from five to ten students, who practice in one or more secondary schools in the neighborhood; in several cases the Direktor is also head of a gymnasium. The feature to be noted about these seminars is that they are wholly unconnected with a university, although several of them are in university towns; two or three of them are open only to classical men; one, in Berlin, is confined to modern-language teachers.<sup>1</sup>

Thus, about 20 per cent of the best candidates offering in Prussia have been provided for, and elsewhere in Germany a few similar seminars may be found; but in no case have they supplied the wants of all candidates, and the Probejahr, up to within the last three years, has been the simplest mode of fulfilling Government requirements with respect to training.

§ 12. III. The new Gymnasial Seminar in Prussia.—The importance of the reform of 1890<sup>2</sup> lies in the fact that it compels all candidates to take a year of real training in a properly organized seminar, and this in addition to and before the Probejahr. The Kultus ministerium of Prussia would, it seems, have adopted this compulsory rule long before if it had seen its way to organize the training for all its candidates. It determined finally to extend the method already adopted in the Royal Pedagogic Seminary and to disregard the claims of the universities to share in training. An invitation was given to some forty of the ablest head masters to establish small seminars in connection with the staff of their schools. A small increase of salary was assigned to the head master and to those of his assistants who joined him in the care of these young men.

The Prussian candidates are now distributed in classes of from 4 to 10 students among some 50 to 60 seminars, the 12 of earlier endowment and the 40 set on foot in 1890.

It is often asked, In what respect does this Seminarjahr, now imposed as an additional year of training, differ from the Probejahr, since both are under the direction of head masters? The difference lies in the elaborate regulations made by the ministerium to insure that the training is effective, and in the provision of proper time<sup>3</sup> and proper remuneration to those who assist in it. According to the official regulations, the head master and his staff are responsible for the following:

(1) A complete course of study and reading, with informal lectures and discussions on pedagogic principles in their application to secondary schools, particularly dealing with those branches in which the candidates are specially qualified to teach; school administration and school hygiene not to be lost sight of; importance to be attached to recent pedagogic literature.

(2) Associated with this study there must be systematic practice in teaching, going from the bottom of the school to the top, with weekly discussions presided over by the Direktor.

(3) The candidates to have the same status as the permanent staff, and to attend its weekly meeting,<sup>4</sup> to join in all assemblies and other school functions, games, festivals, school tours, and the like.

(4) Toward the close of the year the candidates are to write essays on subjects assigned by the director, who finally sends to the ministerium a full report of the year's work. Thereupon the ministerium will appoint each candidate, either to the same or to some other school for a probejahr.

In the eyes of head masters the great merit of this plan is that they are training assistants after their own style; it is the advantage of the apprentice system as

<sup>1</sup>I am told that these royal seminars have taken little interest in pedagogy; their work has been mainly in classical or modern philological studies.

<sup>2</sup>Stat. Jahrb., XXI, XXII.

<sup>3</sup>It is said, however, that in many of these new gymnasial seminars neither the time nor the remuneration are adequate to a right performance of these new duties.

<sup>4</sup>Lehrerkonferenz; required by law to be held weekly in every German school.

contrasted with the technical institute. Every school has its own way of doing things, and a good staff will be willing to take trouble with candidates, in the hope of filling vacancies as they occur with the best of them. A better argument in favor of this gymnasial seminar as opposed to a university seminar is that it brings the student into daily contact with children. There is a great temptation to theorize upon educational topics, and the speculative character of university studies encourages the tendency. The best corrective to it is to be placed much among children and to be trained to observe them in daily intercourse. This personal interest in boys seems very difficult to young men while they are still engaged in university studies, and yet they can not safely pursue pedagogy in the absence of it.

§ 13. IV. *The combination of methods employed in Saxe-Weimar.*—The Duchy of Saxe-Weimar is one of the smaller States which have followed the lead of Prussia, compelled by the practical difficulty alluded to in section 1. It has established a gymnasial seminar in connection with the gymnasium at Jena, but it has also aimed to supply the defects of this method by associating the training of its students with the chair of pedagogy in the university.<sup>1</sup> Every Schulamts-Kandidat in Saxe-Weimar is compelled to spend his seminarjahr at Jena, which has for many years been a chief center of pedagogic study, and is at present the only university which grants funds to conduct a practicing school. Now, the weakness of the Prussian gymnasial seminar lies in the fact that it is conducted by a head master and staff who have left their speculative studies behind them and are likely to ignore the scientific aspects of education and to depreciate the value of research. The Weimar ministerium has therefore sought to avoid this danger, and from close personal observation I am enabled to form a high opinion of the result. By working in the gymnasium the students become familiar with the specific character of gymnasial teaching, but at the same time they are following the training of the university seminar, where they mix with teachers of many types, foreign as well as German, and take their share in prosecuting inquiries and experiments. Thus the narrowing tendency of the gymnasial seminar is corrected by the free and critical spirit prevailing in the university seminar, and the tendency to undue academic speculation in the latter is balanced by the daily routine among teachers of experience in the gymnasium.

NOTE.—An objection is often raised to the training of teachers by giving them practice in school classes, that the teaching<sup>2</sup> suffers too seriously; parents, it is said, do not send their boys to school to be practiced upon by novices. It is not my place to argue the question here; but I may point out that the danger is minimized in these gymnasial seminars by limiting the number of students. Ten is the maximum allowed by the law. Now, 10 students teaching only for ten hours a week each, in a school of 300 to 400 boys, will not seriously injure the instruction, even if it be granted that these criticism lessons do prove to be injurious. The benefit of the plan to the staff is undoubted. Hofrath Richter, the head master of the Jena Gymnasium, reports as follows in his Jahresbericht for 1891-92: "The boys have quickly become accustomed to the presence of a few students in the classroom, and, indeed, we observe a stimulus to their attention and interest when I myself or one or two of my colleagues are also present. And the seminar has certainly had a beneficial effect upon the work of the staff; the masters have the strongest inducement, both to prepare their lesson notes with care and to impart their instruction effectively, since they are to be heard by the seminar students."

§ 14. The following will, perhaps, summarize the results of German experience in training up to the present:

(a) There are two organizations to which the charge of training secondary teach-

<sup>1</sup> Now filled by Professor Rein, the leader of the Herbartian School. The Herbartians have been the main supporters of practical training in the university, as opposed to the merely speculative and theoretical treatment of pedagogy by professors of philosophy or theology, apart from practical work. (See page 704.)

<sup>2</sup> The progress of the boys.

ers should be intrusted—the university and the best schools. Neither of these can do the whole work alone. If the university attempts training, its professor should have some kind of a practicing school; if a secondary school establishes a training department, it must see to it that theory, based upon philosophy, is provided beforehand or side by side with the training.

(b) Comprehensively considered, training covers the whole period of study from the time when the intending teacher leaves school. But the first portion of this period of study (for a degree, or the like) should be conducted, if possible, apart from professional training proper, and, for secondary teachers, should undoubtedly be undertaken at the university.

(c) Training can not be accomplished by a course of private reading followed by an examination; a teacher's certificate is only of value when it shows that the student has been instructed in the science and art of teaching. The certificates of responsible instructors, professors, or head masters, showing that the student has done every part of his training under their oversight, should be an indispensable requirement before registration; an examination, oral or written, can only be regarded as supplementary.

(d) While a comparatively easy gate may be left open for the registration of the ordinary teacher, it is essential to progress that opportunities for advanced training and for the best quality of work be afforded in universities, which should be the appropriate centers for research, in pedagogy as in other fields of professional study.

§ 15. The above account has dealt with the ordinary secondary schoolmaster (Oberlehrer), but two other classes of teachers are employed in secondary schools:

(a<sup>1</sup>) Primary teachers (Volkschullehrer), who have been trained in primary training colleges, and who can qualify to teach the lower forms of a gymnasium, or to teach certain branches, by passing an appropriate examination. In the gymnasien and realschulen about 20 per cent of the whole staff are perhaps drawn from the ranks of the primary teachers; in the third grade schools (Höhere Bürgerschulen) more than half.

The Oberlehrer is always a university man, the Volkschullehrer is not and can not be, but he has very often received a better pedagogic training,<sup>2</sup> and he is placed on a full level of equality with the rest of a gymnasial staff, if he takes a post in a gymnasium instead of remaining in primary work. I do not intend to deal further with the training of these teachers, because this would fall more properly under an account of primary education.

(b) Teachers of special branches, such as drawing and music (Fachlehrer or Technische Lehrer),<sup>3</sup> not regarded as a part of the staff (Lehrer-Kollegium), but certified as belonging to their own profession, as teachers of music or art teachers. These must be certified, like the rest, by the authority of the ministerium, not only as artists, but as competent teachers of their art; their training is regulated by rules applicable to their profession; they must have studied at a conservatorium or a gewerbeschule,<sup>4</sup> or the like.

§ 16. It remains to be pointed out that the States of Germany, in undertaking the control of teachers' training, have done nothing to provide that the teacher, when trained, shall find employment. The same is true, of course, in other professions. In England we meet with many educated men who can not find employment, but in Germany there are far more to be found, and they have not only been highly educated, but have been severely trained. Many Oberlehrer, unable to find a post in a secondary school, have in recent years been admitted as teachers in primary schools; not a few have emigrated; finally, the ministerium in Prussia<sup>5</sup> and in other States have

<sup>1</sup>Stat. Jahrb., 251.

<sup>2</sup>Out of the six years of training required for primary teachers, two are almost entirely given up to pedagogy, practical and theoretical.

<sup>3</sup>Stat. Jahrb., 591. etc.

<sup>4</sup>School of art or technical college.

<sup>5</sup>Stat. Jahrb., 951 (4). Compare the year 1888-89 with the year 1891-92.

made an effort to discourage young men from coming forward as candidates, in order to reduce the supply to a level with the annual number of vacant posts. The question is, in fact, being raised in Germany whether the public authority, which registers teachers by compelling them to a prolonged course of training, should not look forward to their future, and recognize some sort of obligation to find employment for them. Definite action by means of a school law is difficult, and to raise the standard of attainment unduly is unjust,<sup>1</sup> because it injures the candidates by excessive strain; but the excessive competition of an overcrowded profession is equally injurious, and in the schools it produces evils from which both teacher and child have to suffer. The evils are perhaps not so apparent in Germany as in England, because of the control of higher education; but this cause has not suppressed the mischief, although it has modified the form of it.

§17. The training of women teachers and of teachers in special schools.

The influence of women upon German education is very small, and men teachers continue to shut them out from the more important posts in girls' high schools. Some who in theory believe in the value of women as teachers consider that it is unwise to encourage them at present in Germany, so long as a large number of trained men are without employment. Hence the principalship and the best-paid posts in girls' schools are occupied by men,<sup>2</sup> although many instances may be found where lady principals are permitted, especially in semiprivate schools, which are subsidized very often by town councils.

A woman in Germany can not aspire to the highest rank in any profession, for the university is the only gate to the professions, and she is almost universally excluded from university studies; hence her only path to a teacher's certificate lies in seeking training in a primary training college for women teachers (Lehrerinnen seminar). After this course women students usually spend some years in England and France, if they aspire to teach in high schools. The only other method of training is to gain admittance to one of the seminars which in a few cases have been attached to girls' high schools of reputation on the plan of the gymnasial seminar.

Finally, it should be added that all kinds of special schools—for the blind, for the deaf and dumb<sup>3</sup>—as well as commercial and technical institutions,<sup>4</sup> come under the inspection of the ministerium, and hence the teachers of these institutions are required to be equipped with appropriate qualifications. Thus the endeavor is made to extend the benefit of public oversight to every branch of education.

MAY, 1894.

#### MEMORANDUM BY MR. M. E. SADLER ON THE LEAVING EXAMINATION AS CONDUCTED IN THE SECONDARY SCHOOLS OF PRUSSIA.<sup>5</sup>

As reference is frequently made in the course of this report to the German Abiturienten-Examen, a short account of the way in which it is actually conducted may be of service to those who are unacquainted with the details of the system. For the particulars I am indebted to Dr. Emil Hausknecht, of Berlin, a teacher with wide knowledge of German secondary schools.

For each type of secondary school in Prussia a general plan of studies is laid down by the State. But the lines of this general plan are so wide as to give to the head master of each school considerable freedom in framing its curriculum. In this task he naturally takes counsel with the teachers on his staff. When the head master has thus, with the aid of his assistants, planned the curriculum of his school in full

<sup>1</sup> It is no secret in Prussia that that probejahr has been maintained as a sequel to the new seminar-jahr in order to make the career more difficult, and thus to reduce the competition at the expense of the candidate's time and means.

<sup>2</sup> Stat. Jahrb., I, 833-1181.

<sup>3</sup> Stat. Jahrb., I, 733-832.

<sup>4</sup> Stat. Jahrb., II, 96-104, etc.

<sup>5</sup> From vol. 5 of the Report of the Royal (English) Commission on Secondary Education.

detail, his scheme has to be submitted to the "college" of inspectors for their approval. Every three years the plan of studies must be reviewed by the head master and again sent in for the approval of the college of inspectors as before. If in thus revising his curriculum the head master proposes any considerable alterations he must state at length his reasons for doing so. He is also permitted to append to his own statement a supplementary report on the points in question prepared by one of the teachers on his staff. Three written copies of this detailed plan of studies are preserved, one being in the possession of the head master, another in the hands of the inspector, and the third being kept for reference on the part of any assistant teacher in the school.

There lies on the desk of each class room in the school a log book, in which the teacher, before leaving the room at the end of a lesson, enters a brief record of the work done in the course of it. This log book or diary is always accessible to the head master and to the inspector, for whose guidance a complete picture of the course of instruction given in the class is thus preserved. The head master and the inspector, by the aid of this diary, are enabled to check the teacher's methods and to assure themselves that he adheres to the course of instruction prescribed in the detailed curriculum.

Moreover, the more important exercises of the pupils, and especially the "unseens," are written, not on loose sheets of paper, but in notebooks, in which corrections and criticisms are also written by the teacher. The exercises and the corrections are both dated, and the notebooks containing them are carefully preserved for reference for one year, or, in the case of the highest class, for two years. Each pupil has a separate notebook for each subject.

The log book and the exercise books together thus provide a continuous record of the work done by each class. They are regularly examined by the head master, and also by the inspector when the latter visits the school. This he does without notice and at his pleasure, and almost always within the two or three months immediately preceding the leaving examination. The less efficient schools are more frequently inspected. The inspectors, it should be added, are invariably men who have had previous experience as teachers. They are usually appointed when about or a little more than 40 years of age. There are no women inspectors. To each inspector a group of specified schools is assigned for a short term of years. When the inspector visits a school he examines the log books and the exercise books and listens to the teaching given in the classes. He is also permitted to put questions to the pupils, and very often does so.

At the end of each school year there is a "promotion examination" in every class below the highest. The written part of this promotion examination is conducted by the teachers alone, but the oral part is held in the presence of the head master, who may also himself question the scholars. As a matter of fact, only those boys are examined orally whose marks (either in the written examination or in the general report on the year's work) are unsatisfactory. The report on the year's work of each boy has to be sent in to the head master before the written examination begins. It is drawn up in simple symbols; + signifying "ripe," O "not ripe," and ? "doubtful." No great importance is attached to the promotion examination, and boys are sometimes promoted even though they have done badly in it. Promotion from class to class is not determined mechanically by the scale of marks obtained in the promotion examination, but depends on the general character of the pupil's work during the year.

The leaving examination is confined to boys in the first class. Under ordinary circumstances about 25 boys will enter for it in each school. Three months before the examination begins each boy prepares a biographical sketch, in which he shortly reports on his previous education from its commencement to the date of the composition. He is allowed to specify the subjects of which he is particularly fond (including any subject not taught in schools) and those which he had special difficulty in studying. Two months before the examination each master sends to the

head master a paper of questions or problems in the subjects on which he has given instruction. This paper contains three times as many questions as will be required in the leaving examination. The head master examines the questions and either approves them as they stand or revises them after consultation with the teacher concerned. These sets of questions are then sent to the inspector, together with a long characterization of each pupil, written by the class master and agreed to by all the masters engaged in teaching the boy, as well as by the head master. This report on the character of the pupil's work is long and full, being written, partly in symbols and partly in words, on printed schedules. At the same time, also, each master has to report of each individual pupil whether he thinks him ripe to pass the examination. On this point the opinion of the master, on which much depends, is expressed in the words "yes," "no," or "doubtful." His decision, which is based on the boy's work during the year, weighs as much as the written and oral examinations which follow put together. Each boy must have reached in his year's work a certain standard in eight or nine subjects, but special success in a "compensatory subject" countervails failure in one other, German excepted.

On receiving the papers of proposed questions and the reports on the individual pupils, the inspector carefully examines them, and may refer the questions in any subject with which he is not himself familiar to one of his colleagues in the "college" of inspectors to which he belongs. Each "college" will naturally have among its members an expert in each branch of the school curriculum, but different parts of the same school are not assigned to different inspectors. On the contrary, each of the schools is placed, as a whole, under the care of one inspector only for a term of years. The teachers in a particular school may thus come to know in what subjects their inspector is weak, and this may have some effect on the work of the school. It is said, however, that in practice the effect is small, care being taken not to assign a school in which the teaching of a particular subject is weak to an inspector whose knowledge of that subject happens also to be defective.

When the inspector has perused the papers of questions and the reports, he fixes the date for the oral examination. The head master of the school then appoints a day for the written examination, usually choosing a date which will fall from four to five weeks before that fixed by the inspector for the oral examination. The day before the written examination the inspector sends back to the school the papers of questions, having marked on each paper one-third of the questions. The questions so marked are set in the examination. The papers of questions are sent to the head master by the inspector in sealed envelopes, each paper under a separate cover. The questions are not printed. On the day of examination the head master is required to hand the envelope containing the questions, with the seal still unbroken, to the class master in the presence of the candidates. The envelope is then opened and the marked questions are dictated to the candidates, one or more of the latter being asked to repeat them in order to prevent mistakes. From two to five hours are given for each paper, allowance being made for the time taken by the dictation of the questions. The master concerned fills in a certificate showing the exact time at which the seal was broken, when the dictation began and ended, and when the worked papers were collected by him. There are five subjects in which written examinations are held, and the papers are set on consecutive days. Only one paper is given on each day. The dates of the written examination are sometimes so arranged that a Sunday falls in the middle of the examination.

As the master thus knows beforehand the whole list of questions from which those set in the examination will be taken, it may be asked whether he does not specially prepare his pupils to pass in those particular subjects. A strict code of professional honor condemns and prevents any such unfair preparation. It is said that an ordinary teacher would rather commit suicide than thus cram up his boys beforehand to pass in the questions set by himself. His spirit would revolt against the suggestion. At the same time some teachers are occasionally suspected of the practice. In case of such suspicion arising, the inspector pays frequent visits to the class taught by the

suspected master, and closely examines the character of his daily work. He is also free to refuse any of the three sets of questions prepared by the teacher, and to substitute a paper set by himself. But the most effective check on dishonorable practice lies in the fact that any teacher suspected of violating the spirit of the examination is scouted by his colleagues and condemned by professional opinion. If detected in any such offense he is branded with disgrace and dismissed without a pension.

Each set of answers worked in the examination is looked over by the master, who marks each answer 1, 2, 3, or 4, (i. e., very good, good, sufficient, or insufficient). Papers receiving any one of the three highest marks are allowed to "pass." The master is required to set forth in writing the grounds of his decision in respect to each paper. Furthermore, all the teachers concerned with the class look at the papers of all the candidates, and at the biographical sketches prepared by them, in order to form an opinion about each boy. When all this is done the masters meet and make collectively a short report as to the "ripeness" of the various candidates for passing the examination. In making this supplementary report they take into account both their own first decision and the boy's work in the written examination.

All the worked papers, together with this second report and the boys' own biographical sketches, are now sent to the inspector, who, the day before his visit for the viva voce examination, looks through representative parts of the candidates' work.

On the day of the viva voce examination the inspector first presides over a meeting of the examination board, which consists of those masters to whom the head master has intrusted the care of the highest form during the preceding year, together with the head master and the inspector, the presence of the latter being required to make the board technically complete. On the board each man has one vote, the inspector having also a casting vote on any subject on which the opinion of the board happens to be equally divided.

At this meeting of the examination board the inspector first makes general comments and criticisms on the work done in the class. Next he criticises the papers set for the examination, with special reference to their fitness to the particular school, and to their easiness and difficulty as compared with other papers set in corresponding schools elsewhere. He then reviews the corrections made by the teachers on the boys' worked papers. Of these corrections the inspector either states his approval or suggests alterations in them. Next he turns to the marks of each candidate and goes carefully through the record of his work. In case of any doubt he questions the teachers as to the boy's work, or looks into his exercise books for the last two years, these books being required to be at hand during the meeting. Finally, he takes a vote on each boy. According to this vote the candidate is (1) either declared "ripe" without any further viva voce examination (which is equivalent to passing with honors); or (2) admitted to the viva voce examination, in which case he is so examined only in those subjects in which he has not been marked as "sufficient" both for his year's work and in his written examination; or (3) excluded from the viva voce examination. A candidate so excluded is considered as having failed in the examination, and after three such failures a boy can not be admitted to the leaving examination again.

As soon as it has been decided in the meeting of the examining board which of the candidates are to be excused from the viva voce examination, which are to be admitted (and in what subjects), and which are to be excluded, all the candidates are assembled for prayers, and are afterwards introduced to the inspector by the head master. The inspector then announces the names of those who have passed the examination without having to undergo viva voce questioning, and, with a few words of congratulation, excuses them from further attendance. He then tells the other candidates in what subjects they will be required to be examined viva voce, and the oral examination begins at once.

A candidate who is admitted to this viva voce examination can "pull himself up" in any subject in which he has failed to obtain the mark "sufficient" in the written examination. The master, however, may refuse to allow him thus to retrieve his

failure. In case of such refusal, however, the candidate may ask to be examined *viva voce* in any subject in which he has been marked 1 or 2 (i. e., "very good" or "good"), special success compensating for failure in any subject except German and religious knowledge. If a boy's written examination work is marked higher than was his year's work, he must be examined really in order to compensate for loss of marks in respect of his comparative failure in the course of instruction given during the year. If, on the other hand, a boy does badly in the year's work, and passes in the written examination, but fails in *viva voce* he is regarded as having failed in the examination.

In order to lessen the number of papers, there is no written examination in some subjects—e. g., religious knowledge, history, and geography. Each boy's *viva voce* examination in each subject generally lasts from twenty minutes to half an hour. Every candidate must pass in all subjects, except drawing, singing, and gymnastics.

The inspector may, if he likes, examine a boy *viva voce* in religious knowledge, history, and geography; but in these subjects the master's report on the candidate's work during the year is generally decisive. The teaching of history in German schools is said to be good, though the results are rarely subjected to an external test in the leaving examination. As a matter of fact, however, boys in the highest class often find no small difficulty in obtaining from their teacher a satisfactory report in history and religious knowledge.

The *viva voce* part of the leaving examination, including the meeting of the examining board which precedes it, usually lasts one day—e. g., from 8 a. m. to 6 or 7 p. m., with a short break for lunch.

At the close of the examination day the examination board meets once more, the inspector being present. At this meeting all the other masters attend and may be asked questions by the inspector; but they have no vote or voice in the discussion. The results of the examination are announced at the end of the day, each candidate being simply told whether he has passed or failed. But the certificate which the candidate receives afterwards goes into very considerable detail.

When held in schools which have a nine-years course the leaving examination admits the successful candidate to the university, except that in the case of the real-gymnasium and the ober-realschule it does not admit the student to academic study in classical philology, philosophy, theology, law, or medicine. When held in the real-schule, where the course is of six years' duration, the leaving examination confers a certificate which admits the holder to many of the professions and to the civil service.

It will be remembered that in his report on German schools, presented to the schools inquiry commission, Mr. Matthew Arnold thus summarized the rules of the leaving examination: "It is to be such as a scholar of fair ability and proper diligence may, at the end of his school course, come to with a quiet mind and without a painful preparatory effort, tending to relaxation and torpor as soon as the effort is over." And he remarked on the care which is taken that "the instruction in the highest class should not degenerate into a preparation for the examination; that the pupil may have the requisite time to come steadily and without overhurry to the fullness of the measure of his powers and character; and that he may be securely and thoroughly formed, instead of being bewildered and oppressed by a mass of information hastily heaped together."

The Prussian *abiturienten* examen is interesting alike in respect of its methods and in the privileges which it confers. Its methods are carefully devised so as to give to the teacher a large degree of freedom in framing the curriculum of his school and in forming a fair judgment of his pupils' abilities. But the whole examination depends on the fact that it is attached to an organized system of inspection. There seems, however, nothing to prevent this method of examination (with some modification) from being tried experimentally by one or other of our examining authorities.

## CHAPTER XV.

### HIGHER EDUCATION IN RUSSIAN, AUSTRIAN, AND PRUSSIAN POLAND.

By HERMANN SCHOENFELD, Ph. D., *Professor of Modern Languages and Continental History in the Columbian University, Washington, D. C.*

---

TOPICAL OUTLINE.—*General summary of education.—Plan and arrangement.—Extent of Poland.—The Poles and the dismemberment.—Language.—Its structure. Sketch of the higher education in Poland during her independence: Ancient foundation of the University of Cracow; its early history.—Polish schools at the time of the Reformation.—Revival of higher education and downfall of Poland. Higher education in Russian Poland: The New University of Warsaw.—Constitution of the University of Warsaw.—Latest statistics of the University of Warsaw.—Report of the rector.—The four faculties.—Institute of veterinary surgery.—University library.—Archives.—Secondary education in Warsaw.—Musical education in Warsaw.—Secondary education in the country at large.—Wilno.—Archives of Wilno. Witebsk. Higher education in Austrian Poland: New University of Cracow.—Imperial Academy of Sciences.—The four faculties.—University library.—State archives.—University of Lemberg.—University library; Ossoliński library; Archives.—Imperial School of Technology in Lemberg; secondary schools.—Secondary schools in Galicia. Education in the ancient Polish provinces of Prussia: Polish origin of the University of Königsberg.—Lyceum Hosianum; secondary schools in Prussia; libraries.—Province of Posen, libraries.*

#### GENERAL SUMMARY.

The Kingdom, or rather Republic, of Poland<sup>1</sup> (*Rzeczpospolita Polska*) disappeared from the commonwealth of nations, after an existence of eight hundred years, at the end of the last century. The dismemberment of the Republic, which in the sixteenth century was the greatest power of eastern Europe and had for centuries served as a bulwark

---

<sup>1</sup> "Poland," says Lelewel, one of her greatest historians, "is a veritable and pure Republic, only invested with the forms of a constitutional monarchy." The principal character in the constitution of the Polish Government was a very decided separation between the executive power intrusted to the King, and the legislative power, superior to the former and exercised by the nation, i. e., the representatives of those citizens who alone enjoyed political rights, the nobility and the clergy. These deputies, *nuntii*, about 200 before the partition, and the senators, elected by the King, could assemble either separately or combined, thus forming but one Chamber, the Diet (*Seym*), *generale omnium terrarum conventum*.

against the destructive invasions into Europe of the Mongolian, Tartar, and Turkish hordes,<sup>1</sup> was accomplished by Russia, Austria, and Prussia in three partitions (1772, 1793, 1795). The parts which once constituted the Republic of Poland are still integral parts of the three countries respectively. According to Morfill's words, "Its limbs, although distorted, are still instinct with life;" its language is still spoken by upwards of ten millions; its literature is the oldest Slavonic literature next to Bohemian, and surpasses in importance and scope all the other Slavonic literatures taken together, i. e., Bohemian, Servian, Croatian, Slavonian, Russian, Bulgarian.<sup>2</sup> Its institutions and laws have perished, some of them fortunately for the broad masses of the Polish people who had nothing but the patrimony of the disinherited, serfdom. Austria at once introduced into Galicia the Austrian civil code; in the Prussian Polish provinces the Prussian Landrecht prevails. Russia alone permitted to the Kingdom (tsarstvo) of Poland a shadow of self-government and many privileges. Alexander I conferred great privileges upon the University of Wilno, confirmed the Lithuanian statutes in the western and southwestern governments and the code of Napoleon in Poland proper from the year 1807. But all this was changed into Russian law by a ukase of June 25, 1840. Yet in spite of the difficulties and restrictions under which the dismembered country labors, there are several very active centers of Polish literature, culture, and education, foremost among them Cracow and Lemberg, thoroughly Polish, excellent universities in Austrian Galicia. The work of the Academy of Cracow, founded in 1872, is of such a high standard of excellence, its editions of the Polish authors of the golden age (1541-1606) are so valuable, the many learned reviews that appear in Polish, equal to the best in other civilized countries, present so much original research and material that it is only a question of time when Polish literature and culture as well as that of the other Slavonic countries will constitute an essential part of instruction in our universities to supplement the Germanic and Romance languages and literatures.

---

<sup>1</sup>In the reign of Boleslas V (1227-1279) the frightful Mongolian invasion took place (1241). Although gaining a Pyrrhus victory at the battle of Lignica (Liegnitz) in Silesia, they were diverted into Hungary after their force had been broken. Nothing since the battle on the Catalaunian fields can be compared with that carnage. In the fifteenth, sixteenth, and seventeenth centuries, the Poles went forth the champions of Christendom and rolled back the tide of Moslem conquest from Europe. Justly, therefore, Melancthon, speaking on this subject, says: "The magnanimity of this nation is especially displayed in their continual wars against the Tartars for the tranquillity of all Europe. For centuries she has protected Europe against the Tartars and the neighborhood of savage Asia. Let us never forget these obligations to Poland, and let us recollect who are the people, and in what regions of the earth they were made instruments of Providence, and by protecting Europe, enabled her to preserve within her bosom humanity, religion, and those arts and sciences so beneficial to society."

<sup>2</sup>According to Estreicher (*Bibliographia Polonica*, Cracow, 1870), it represents two-thirds of the entire Slavonic literature.

The University of Warsaw, although Russified to a great extent since the late insurrection, is still rich in national Polish spirit, learning, and culture. The Polish press of Warsaw still turns out many valuable books, magazines, and reviews in all branches of literature and science.

Prussia has best succeeded in Germanizing her Polish possessions, slowly eliminating or weakening the Polish element, "carefully avoiding any of those reprisals which would cause a European scandal." But "*der neue Kurs*," under the enlightened young Emperor William II, has thoroughly reversed the old theory, if not the old practice. Coercion has been reduced to a minimum, yet the German language makes more rapid strides than ever and does not suffer under the fact that Polish is cultivated in family and school, especially in the religious education of the people, who are mostly Roman Catholics. It seems as if the idea had won ground in the highest authoritative circles of Prussia that a people with an almost equally old western civilization, abundantly rich literature, language, and history, can not be weaned and severed from it by persuasion, force or police measures. Thus, while the provinces of Posen, Upper Silesia, and old Prussia have a by far greater German population and more completely Germanized Slavs under the admirable Prussian school system, the educational influence of three years' military training,<sup>1</sup> and the general high standard of Prussia's judiciary and administrative institutions, yet the Polish language and literature are extensively cultivated among the people by the Catholic Church, in the public schools by Polish teachers during the limited time that is allotted to their language, and in the higher schools for their intrinsic value and because it is a fundamental necessity for understanding the historical origin and development of all the provinces between the Elbe, or at least the Oder, and the Vistula. Indeed, the colonization by the German element of all that land is nothing but a protracted struggle, beginning as early as Charlemagne's time and not finished yet by far, to subject, to absorb, or to annihilate the Slavonic, principally Polish, population that has expanded over the territory vacated by the German tribes during the first migrations of peoples. For Leopold von Ranke's statement, "*Es sind zwei Völkerwanderungen, durch die der Umkreis der deutschen Gebiete aus dem inneren Germanien her bestimmt worden: die eine war nach dem Westen, die andere nach dem Osten gerichtet*," is absolutely correct. But while the Germanic tribes had pushed themselves forward toward the west and south in powerful streams and in a comparatively short period of time, the backward

<sup>1</sup> I venture this statement, which may seem paradoxical to those who are wont to consider the German military service as a waste of time and energy, removing hundreds of thousands of men from temporary production. But any military instructor who, like myself, has had an opportunity of observing many Polish recruits who come to the army as alphabets and leave it with a good equipment of German education, an enlarged horizon and excellent training, will surely agree with me.

flood toward the east against the natural course of Slavonic immigration occurred slowly, gradually, through many centuries, often interrupted by long pauses, historically not determined. While during the first migration Teutonic pagans pushed beyond the boundaries of Germania, it was Catholic Christianity, the victorious Roman Church, the monks, who accompanied the progress of the Germans; later on it was the Reformation which led thousands and thousands toward the East. It is, of course, not to be forgotten that a second main incentive was the craving for material wealth and worldly power which made such invasions very bloody, cruel, and unjust, full of epic battles and adventures so graphically described in Mickiewicz's *Konrad Wallenrod*, concerning the struggle between the Lithuanians and the Teutonic knights.

There is no Polish university in these Prussian provinces it is true, but Posen and Bromberg (Bydgoszcz), Danzig and Thorn, even Breslau, the capital of Silesia, and all the Upper Silesian towns, not to speak of its mostly Polish villages, have still very strong Polish traits and traces. The concessions made to Polish education especially and Slavonic languages and literatures generally, the importance attributed to these branches in Prussia appear from the strong Slavonic departments not only at the eastern universities of Breslau and Königsberg, but also at the University of Berlin. It is a very characteristic fact that for the first time, so far as I know, a scholar in Slavonic languages, the famous Wladyslaw Nehring, has become rector magnificus of the University of Breslau (1893-94).

Prof. Karl Brugman, of Leipzig, in *Die Deutschen Universitäten*, edited by W. Lexis, says in regard to Slavonic philology in Germany: "Slavonic philology, that bloomed up in the countries of the Austrian Crown and is about as old as Germanic and Romance philology, can naturally not have such a broad ground in Germany as its sister disciplines. It has at present three full professorships, in Breslau, Leipsic, Berlin, occupied by Nehring, A. Leskien, whose principal merits lie in the domain of Slavonic grammar, and A. Brückner.<sup>1</sup> Besides the great successor of Miklosich (d. 1891), V. Jagić, who, besides an extraordinary many-sidedness in literary production, has done an exceedingly meritorious work in grammar as well as in editing revised texts and investigating topics of literary history, was at the University of Berlin for several years (1874-1880). The latter is the founder of the *Archiv für slav. Philologie* (founded in 1875), the central organ of that science."

As for the important rôle that the Slavonic element has been destined to play in German life, it appears from the history and literature of Germany, which are quite permeated with its influence, German historians never grow tired of showing the contrast of the two national characters; German poets and authors compare and contrast their

<sup>1</sup> In the research of the Baltic-Slavonic languages, the works of Leskien, A. Bezzenberger (Gottingue, Königsberg), and A. Brückner (Berlin) are foremost.

traits and peculiarities, their ideals of education and culture. No one has done it better from a German point of view than Gustav Freytag, himself born on the frontier of Upper Silesia and Russian Poland, at Kreuzburg, in his *Soll und Haben*, and especially in his classical historical novels *Die Ahnen* and *Bilder aus der deutschen Vergangenheit*.

#### PLAN AND ARRANGEMENT.

It is my particular task to give a report on the higher education in the different parts of Poland, and with special reference to the shaping of the methods of instruction and organization on the part of the three Governments, Russia, Austria, and Prussia, with a view to assimilating the Slavonic population to the Government policies, social traditions, and civilization of the three nations respectively.<sup>1</sup>

For this undertaking it is necessary, first, to define more accurately the limits of the Kingdom of Poland at the time of her prosperity and of her decadence, while yet independent among the European nations; second, to give a sketch of the development of her educational facilities in the way of higher institutions of learning and universities during the period of her independence. Only from a comparison of her educational conditions while independent can we ascertain and realize her progress or retrogression in higher education after her partition, the changes wrought for good or for evil, the assimilation to or reaction against foreign influences, the transmutation of political and social ideals, the participation of the different classes in an education which is partly not their own, inoculated with ideals conceived by her conquerors in order to bring her children to a gradual mental and intellectual as well as physical subjection.

#### EXTENT OF POLAND.

At the period of her greatest prosperity under the later Jagiellos, Sigismund I, Sigismund II Augustus (1507-1572), the short interregnum and the brief nominal reign of Henry of Valois (1575), and the valiant Stephen Batory (1576-1586), Poland extended from the Baltic to the Black Sea, touching it at Akerman; from Bohemia, Moravia, Austria proper, Hungary, and the Danubian principalities to Russia beyond the Dnieper. The greatest length of the country from north to south was 713 English miles, and from east to west 693 miles. It embraced an area of about 282,000 English square miles, and this area in 1880 had a population of 24,000,000.

For our investigation, however, which concerns Polish soil and

---

<sup>1</sup> The present monograph is a summary of a more extensive work on Higher Education in Poland now in course of preparation, and to be published later through the regular channels of trade. The author begs to acknowledge assistance from Senator Michael Kruszká, of Milwaukee, on Galician secondary schools, and receipt of valuable printed material from the pedagogical and geographical societies of Lemberg.

Polish people proper, we must exclude all the country which was not Polish in spirit and nationality, though at certain times it belonged to the republic by conquest. Thus that part of Kijowska which lies beyond the Dnieper, including the famous old city of Kief, one of the cradles of Russia, was ceded by the Crown to the latter country by the treaty of Andruszowo, 1667, and was never gotten back. Kief is consequently a purely Russian university, which will find no place in our treatise on higher education in Poland.<sup>1</sup>

Anatole Leroy-Beaulieu, in his unsurpassed work, *The Empire of the Tsars and the Russians*, has best expressed this idea, saying: "Separated from Great Russia at the time of the Tartar invasion, Little Russia was through five centuries subject to Poland and Lithuania, not to much purpose. Only the polished surface—the nobility of Kief, Volhynia, Podolia—became Polonized. It is owing preeminently to the Greek orthodox rite that the bulk of the people, the immense majority of the inhabitants of Kief and Ukraïna, have turned out quite as Russian as the people of Moscow." Leroy-Beaulieu's clever translator, Zénaïde A. Ragozin, shows in a footnote (I, p. 118) that the statistician, Tshubinsky, who has published some very detailed statistical tables on this very subject, has found out that the Poles could not muster 100,000 strong in the above three governments put together. Even making allowance for some exaggeration in the Russian documents, still so much remains that the figure of the genuinely Polish population is extremely low. In those three governments the number of Catholics, among whom there certainly are non-Polonized Little Russians, amounted to scarcely 400,000, or less than a seventh of the entire population (16.94 per cent). In these same three governments the number of Israelites rose to over 750,000. Unfortunately, Mme. Ragozin extends this calculation also to Lithuania and White Russia, i. e., to all the provinces annexed in one of the three divisions of Poland, without any statistical proof.

Smolenska also, with the important city of Smolensk, an object of strife between Lithuania, Poland, on one hand and Russia on the other, was transferred to Russia forever by the treaty of Andruszowo. Nor was Inflanka, or Livonia, with the old Hanseatic city of Riga, though acquired by Poland in 1561, ever Polish in spirit, or sympathy, or civilization.

Poland, in the strict sense of the term, also called the Crown of Poland (Korona), consisting of Great Poland (Wielkopolska) with the principal cities of Posen (Poznań), dating from the earliest period of the Republic, and Warsaw (Warszawa), which became the capital of the country as late as the reign of Sigismund III, and of Little Poland (Małopolska) with the famous old capital Cracow (Kraków), was united with Lithuania (Litwa) by the marriage of Jadwiga, the Polish

<sup>1</sup> We shall, however, learn later that this university, after the suppression of Warsaw, was the greatest resort of Polish students.

queen, with Jagiello, duke of Lithuania (1386); a more complete federation taking place at Lublin in 1569. The capital was Wilno; the official language of the country was White Russian, in which tongue its laws were promulgated. With this union Christianity was introduced. A Polish university was founded at Wilno by Stephen Batory under the care of the Jesuits (1578), which for centuries exercised its Polish and Roman Catholic influence upon the country, until it was suppressed by Emperor Nicholas I (1833) after the outbreak of the Polish insurrection of 1830, and the University of Kharkof founded in its stead.

As to a more accurate division of the *Rzeczpospolita Polska* in Palatinates (*Wojewódstwa*) for administrative and military purposes I may safely refer the reader to Morfill's *Story of Poland* (pp. 1-11), who follows Michael Bobrzyński's "*Dzieje Polski w Zarysie*," Warsaw, 1881, Vol. II, p. 363.

#### THE POLES AND THE DISMEMBERMENT.

This country was from time immemorial<sup>1</sup> inhabited by Slavonic tribes belonging to the great Indo-European or Aryan family of peoples. The early Slavs are said by the best historians to have been a peaceful agricultural people living under a patriarchal Democratic rule, without priests or kings, but the invasions of Asiatic hordes and the conflicts with the German tribes compelled them to adopt a sort of monarchical government. But the origin of Poland is fabulous;<sup>2</sup> history but begins with the reign of Mieczyslaw I and the introduction of Christianity in the Latin form under him (965), thus placing Poland at the outset in contrast to Russia, whose civilization was to be Greek in the Byzantine form.

Šafařík finds the first mentioning of this people in the Geography of Ptolemy, who lived in the second century A. D. They are here mentioned under the name of Bulanes. The generally accepted derivation of the name is from pole, field, plain, the country being one vast plain. Nestor, the old Russian chronicler, distinguishes between the Poliane Liakhove on the Vistula and the Poliane Rusove on the Dnieper, the dwellers on the Vistula plains and the dwellers on the Dnieper plains. Röpell, the excellent German historian of Poland,<sup>3</sup> has traced the devel-

<sup>1</sup> That is after having branched off from their original Iranian or Indo-European home in Asia, they immigrated into Europe at a period contemporaneous with or rather after the arrival of the Teutonic families. But an autochthonous origin in Europe for the entire Indo-European race has been also maintained by such scholars as Penka and Schrader (*Origines Ariacæ*, Vienna, 1883), *Sprachvergleichung und Urgeschichte* (1885). Morfill has given a very excellent abstract, sifting the frequently conflicting views of the best Slavonic scholars on the Slavonic origin. (See Article "Slavs," *Encycl. Brit.*, Vol. XXII, pp. 145-147.)

<sup>2</sup> Lelewel, the great Polish historian, has relegated all the period of Polish history from the earliest times to the reign of Mieczyslaw to the era of myths.

<sup>3</sup> The standard history of Poland by Röpell has been continued by Caro, both professors of the University of Breslau.

opment of the various divisions of society among the Poles back to their origin, showing how the nobility, *szlachta* (probably derived from the German word *Geschlecht*), became in course of time the Polish nation properly so-called, subjecting the *cmietones* (*kmieci*), an originally free class of peasants, and the peasants strictly so called (*chłopi*), to absolute bondage. When in the course of history also the power of the king was gradually diminished to a mere shadow by the *pacta conventa*, the military *szlachta* became the sole and almost absolute bearer of the power of the state. In this fact lies the germ of Poland's destruction, which became realized when the "*Adelsrepublik*," as Röpell calls it, had no other basis than a degraded aristocracy fallen from their old lofty patriotism, a national middle class being absolutely wanting, the trade of the country being almost entirely in the hands of foreigners, or people with foreign proclivities, Germans and Jews.<sup>1</sup>

So the dismemberment began. In 1772 Prussia took the Palatinates of Malborg (Marienburg), Pomeria (Pomerellen), Warmia (Ermeland), Culm, except Danzig and Thorn and a part of Great Poland; Austria took Red Russia or Galicia, with a part of Podolia, Sandomir, and Cracow; Russia took White Russia, with all the part beyond the Dnieper. The territories seized by the three powers amounted to 13,000 English square miles, 416,000 inhabitants; 27,000 square miles, 2,700,000 inhabitants; 42,000 square miles, 1,800,000 inhabitants, respectively.

But in spite of many fruitless attempts to amend the new constitution, promulgated May 2, 1791, a second partition by Russia and Prussia took place in 1793, appropriating to Prussia the remainder of Great and a portion of Little Poland (22,000 square miles with 1,100,000 inhabitants), and advancing the Russian boundary to the center of Lithuania and Volhynia (96,000 square miles, 3,000,000 inhabitants).

In the third and last partition Austria participated, taking Cracow, with the country between the Pilica, the Vistula, and the Bug (18,000 square miles, 1,000,000 inhabitants); Prussia had the capital, with the territory as far as the Niemen (21,000 square miles, 1,000,000 inhabitants); Russia took the rest, amounting to 43,000 square miles, 1,200,000 inhabitants.

During the general European upheaval at the time of the Napoleonic wars waged against Prussia and Russia (1806-1807) and Austria (1809), when the Poles rallied round him a faithful army of patriots, Napoleon established the Duchy of Warsaw by the treaty of Tilsit (1807), chiefly out of the Prussian share of Poland, with a liberal constitution and the Elector of Saxony at its head. The duchy, under the guidance of Prince Joseph Poniatowski, wrenched western Galicia from Austria

<sup>1</sup>Of course the nobility of Poland differed entirely from the feudal nobility of the rest of Europe. The former sprang originally from among the country people. There were in Poland many villages, inhabited by a population of nobles only, who were as poor as the peasants, yet enjoying the same political rights with the wealthiest magnates.

(1809) after the defeat of the latter at Austerlitz. But with Napoleon's sinking star the grand allied army in 1813 put an end to its existence. After the cessions by Austria in 1809 the duchy contained 58,290 English square miles, with about 4,000,000 inhabitants.

The division of Poland was rearranged by the congress of Vienna in 1815. The original shares of Prussia and Austria were diminished. Prussia was to have Posen and what she had gained at the first partition. Austria was to have Galicia and the salt mines of Wieliczka, while the city and district of Cracow were to form an independent republic under the guarantee of the three powers, and were seized by Austria only in 1846 after a violent insurrection. The remainder of ancient Poland, comprising the chief parts of the recent Grand Duchy of Warsaw, reverted to Russia, and was to form a constitutional kingdom subject to the Czar.<sup>1</sup>

The country we have to deal with in our report, as finally arranged, is as follows:

Russian Poland, since 1867, for administrative purposes, is divided into 10 governments, viz:

| Governments.  | English square miles. | Population. | Governments. | English square miles. | Population. |
|---------------|-----------------------|-------------|--------------|-----------------------|-------------|
| Kalisz.....   | 4, 400                | 774, 759    | Radom.....   | 4, 762                | 644, 827    |
| Kielce.....   | 2, 890                | 622, 842    | Siedlee..... | 5, 527                | 622, 465    |
| Łomża.....    | 4, 677                | 538, 588    | Suwałki..... | 4, 847                | 603, 174    |
| Lublin.....   | 6, 506                | 860, 382    | Warsaw.....  | 5, 613                | 1, 314, 269 |
| Piotrków..... | 4, 720                | 837, 928    |              |                       |             |
| Płock.....    | 4, 209                | 538, 141    | Total.....   | 48, 151               | 7, 357, 375 |

Prussian Poland, including Posen, most of Western Prussia, and several districts in Eastern Prussia; 26,000 square miles, 3,000,000 inhabitants.

Austrian Poland, including Galicia, Lodomeria, Bukovina, and Zipsete; 35,500 square miles, 5,000,000 inhabitants.

If we exempt the German, the Armenian, the Ugro-Finnish, and Jewish elements, the bulk of the Polish population proper, according to the calculations accompanying the ethnological map of Mirkovich (1877), amounts to 4,633,378 in the Russian Empire; 2,404,458 and 110,000 Kashubes (Kassuben) living on the coast of the Baltic near Danzig, in Prussia, and 2,444,200 in Austria. Besides these there are 10,000 in Turkey. These figures give a gross total of 9,602,036. (Morfill, *Story of Poland*, p. 12.) This calculation is very moderate, and I am inclined to put it at a rather higher figure. Kropotkine, in his excellent article on Russian Poland in the *Encyclopedia Britannica* (ninth edition), numbers in Russia, outside of Poland proper, about 1,162,050 Poles in 1881.

<sup>1</sup> This Kingdom of Poland, or Congress Poland (Kongressówka), alone constitutes the whole of Russian Poland in the eyes of the Russians, who refuse to recognize as Polish the provinces annexed by Catherine II.

The prevalent religion among the Poles is the Roman Catholic, to which in Russian Poland 4,596,956 out of a population of 6,034,430 belonged (1870). Since the last insurrection a series of measures have been taken to reduce the numbers of the Roman Catholic clergy in Poland. In 1883 there remained 1,313 churches out of 1,401; 1,544 priests out of 2,322; 10 monasteries out of 29, and 8 convents out of 30; one diocese (Podlasie) having been abolished, and a new one established at Kielce, while several bishops had been sent out of the country. The whole situation remained unsettled until 1883, when the Pope recognized the new diocesan subdivisions introduced by the Russian Government. Poland is now divided into four dioceses—Warsaw, Sedomierz, Lublin, and Plock. (Kropotkine, Poland, Vol. XIX, pp. 309, 310.)

The Austrian Poles enjoy absolute religious freedom under their Apostolic Emperor of Austria, as well as a practical self-administration of their schools in an entirely national Polish spirit.

In Prussia, too, after the discontinuation of the "Kulturkampf," perfect religious peace has been restored. At the old bishopric of Posen-Gnesen (Poznań-Gniazno), founded by Mieczyslaw with the aid of St. Adalbert of Prague in 968, a Polish archbishop, Stablewski, has been inaugurated and confirmed by the German Emperor to further and enhance the union and harmony between the Roman Catholic Poles and their Lutheran German brethren. This was an act of far-reaching, ideal, and political importance—an acknowledgment of the Poles in Prussia and their claims as to freedom of language, religion, and a sort of home rule, of course within the principles of true Prussian citizenship and loyalty. The fact that a Polish archbishop occupies the seat of St. Adalbert, who for a short time was the second archbishop of Gnesen, before he went out to preach the gospel among the heathen Prussians<sup>1</sup> and suffered martyrdom, is a provisional solution of the Polish question, the more favorable to the Poles as it thoroughly reverses the former policy instituted against them.

On the whole, no retrogression of the Roman Catholic religion in Poland is going on outside of Russia. According to Lelewel the population of Poland in 1764 was subdivided as follows in the way of the different cults: Catholics, 7,000,000; United Greeks, 1,500,000; Protestants, 1,000,000; Orthodox Greek-Russian, 2,000,000; Jews, over 1,500,000; Mahometans, 50,000; Armenians, 30,000; Mennonites, 20,000; Jewish Caraites, 20,000.

While the Roman Catholic religion is normally growing in Prussian Poland, and especially in Austrian Poland, several millions of Russian Poles have since the last century been converted to the Orthodox Greek religion, owing to the political and social advantages arising therefrom and the prodigious spread of Orthodox Greek churches over the country.

<sup>1</sup> It is a curious historical incident that the heathen Prussians, who, with the Letts and Lithuanians, belonged to the Litu-Slavic family, for which Leskien has proposed the generic name "Baltic," should have given their name to that power which forms the bone and marrow of the German Empire.

## LANGUAGE.

The language in which the vast and rich treasures of Polish literature are stored belongs to the western branch of the Slavonic tongue. To this branch belong (1) Polish: Masovian or Mazurian, Great Polish, Kashubish, and the upper Silesian dialects, which have very much degenerated (*Wasserpölnisch*). (2) Bohemian: Czechish, Moravian, and Slovakish. (3) Lusatian Wendish or Sorbish, which is gradually dying out and will soon be extinct like Polabish.

The dialect of Great Poland has become the literary language, rich and powerful, flexible and sonorous, no Indo-European language except Sanscrit presenting such a variety of inflections and sounds to mold it according to all emotions that may pervade man's breast. But this language has been deteriorated by foreign unassimilated elements that have crept in, just as German was impaired by the invasion of French in the seventeenth century. When large colonies of Germans began to settle in Poland after the Mongolian invasion (1241), which had widely devastated the country, and to build many German towns, and usurped nearly the entire trade of the country, for which the Poles never had either inclination or talent, a large stock of German words poured into Polish, giving it a strange alien aspect. As these Germans enjoyed, among many other privileges, their own laws also, the *Jus Magdeburgicum*, a "*Sonderstaat im Staate*," existed up to Casimir the Great's time, influencing also their judiciary organization.

With the reign of Sigismund III (1589-1632) the continuous wars and invasions of Poland and an all-pervading, very poor church Latin contributed considerably to bring about a degeneration in the Polish language and literature which threatened to suffocate the national idiom. The latter lost a great deal of its purity by the entrance of bad taste and macaronism. Theological dissertations in the manner of the decadence of scholasticism and affected panegyrics supplanted original invention and did the language itself untold harm. Yet a poet like *Sarbiewski*, who, according to *Hugo Grotius*, "did not only equal but surpassed *Horace*," and the poetess *Elizabeth Druzbatska*, show such purity of style and grace, such delicacy of thought and taste, that the inroad of all macaronism and pedantry in speech and literature could not stamp out the slumbering force of the Polish language. Still many unnecessary Latinisms disfigure the Polish language, which is not strange, since this macaronic period can be said to have lasted from 1606 to 1764. Yet, in flexibility, richness, power, and harmony, Polish is not excelled by any other language in Europe; its grammatical structure is fully developed and firmly established, its orthography precise and perfect. *Morfill* rightly quotes the poet *Casimir Brodzinski's* beautiful and expressive characterization of his native tongue:

Let the Pole smile with manly pride when the inhabitant of the banks of the Tiber or Seine calls his language rude; let him hear with keen satisfaction and the

dignity of a judge the stranger who painfully struggles with the Polish pronunciation like a Sybarite trying to lift an old Roman coat of armor, or when he strives to articulate the language of men with the weak accent of children. So long as courage is not lost in our nation, while our manners have not become degraded, let us not disavow this manly roughness of our language. It has its harmony, its melody, but it is the murmur of an oak of three hundred years, and not the plaintive and feeble cry of a reed, swayed by every wind.

It would be impossible to give a fair idea of the grammatical structure of the language in a short survey of its phonetics, forms, and grammatical differences from the other sister languages. But a few hints at its nature may induce some reader to take recourse to one of the many excellent Polish grammars; besides, it may be considered necessary to have at least a vague insight into the language which was the basis of the educational system of a great realm and is still the medium through which education, culture, and the history and literature of a great past is inculcated in 10,000,000 souls.

*Its structure.*—The Slavonic languages, it should be first noticed, do not differ from one another to such an extent as, for instance, the Teutonic or even the Romance languages. A Slav<sup>1</sup> who knows his language to perfection will, I dare say, always be able to understand and to make himself understood among the other peoples of his race or at least of his subdivision (Southeast and West). The Low German dialect of Holstein and the Swiss dialect certainly differ very much more than Polish, Bohemian, and Lusatian.

The principal changes in the various Slavonic languages have been brought about under the destructive influence exercised by the vowel *i* and the semivowel *j* upon the preceding consonants. Thus many mutes were reduced to mere hissing sounds; hence comes this characteristic sibilation so frequent in the Slavonic languages, though not equally so in all of them.

The apparent heaping of consonants, especially at the beginning of syllables, by which so many are deterred from studying the languages, fearing the impossibility of pronouncing them, is really no heaping at all. Many of these consonants are liquid, and if not, they become liquid (*mouillé*) by very pure and sonorous vowels following them to modify any harshness that may arise. This prejudice against the harshness of the Slavonic languages has been largely created by the uncomfortable orthography in the Polish language, which frequently expresses one sound by a combination of two, nay, four consonants; thus Polish *sz*, *cz*, *szez* are expressed in Russian by one sign. Though not harsh, Polish has more hissing sounds than any other Slavonic language.

<sup>1</sup>The name of the Slavs properly means illustrious, glorious; *slava*, *slavitsa* (old Slavonic), glory; *slavinu*, glorious; Lithuanian *szlowe*, glory, derived from old Slavonic *sluti*, to hear; church Slavonic *slysza*, I hear; *sluch*, the reputation; modern Russian *slyszat*; Polish *słuchać*, to hear, also in the sense of *bene audire*. Hence Russian *Slavjanin*, *slavjanskij*; Polish *Slowianin*, *Slowjanski*; Czech *Slovan*, *Slavsky*, for Slav, Slavonic.

In regard to grammatical forms the Slavonic languages are infinitely superior to the Germanic and Neolatin languages. They are closer related to the synthetic languages, the nouns having no articles (but, of course, demonstrative pronouns), and the verbs being almost always conjugated without personal pronouns.

The Polish language has a most elaborate declensional system, comprising seven cases, by which the use of prepositions is limited and a great freedom of position of words insured in the sentences. Like Sanscrit, it possesses the nominative, genitive, dative, accusative, vocative, instrumentalis, locativus, wanting only the ablative. The noun has one of the three genders, but has lost the dual, which still exists in the Masovian dialect. It also has more diminutives and augmentatives than either Latin<sup>1</sup> or Italian.

The adjectives have diminutives and augmentatives besides the three degrees, as, for instance, *mały*, small; comparative, *mniejszy*; superlative, *najmniejszy*; diminutive, *malutki*, *malenki*; *zielony*, green; *zielonawy*, greenish.

The verbs, by means of the so-called "aspects," have very delicate distinctions of meaning in the conditions of time, and even gender, quite unknown in the other modern languages. They have causative, iterative, inceptive, perfective, durative, participial, etc., forms, which contribute a great deal to the lucidity of grammatical constructions. Every root word thus becomes, according to the great philologist Schleicher, the germ of a largely ramified tree of derivative forms, each of which expresses a different sense. There is a creative vitality in their forms infinitely superior to the rigid, decrepit crystallization of the Germanic and Latin languages, as Schleicher puts it.

Less remote from Palæo-Slavonic than Russian, for instance, it has preserved some peculiar characteristics of the mother tongue, among them a (pronounced like French *salon*) and e (*satın*).

Ż is another consonant which does not exist in any other language.

It is similar to ll in Spanish, and has a peculiarly broad and thick sound.

The phonetic wealth of the language is expressed by 35 consonants, 9 vowels, and 1 letter j, which is considered to be a semivowel and semiconsonant.

The accent, except in foreign words and in compounds, which are exceedingly rare, is constantly on the penultimate—*ródak*, countryman; genitive, *rodąka*; dative, *rodakówi*.

In Polish words the syllable with the vowel which has the tonic accent is long; the other syllables are short. Thus the Polish language combines the advantages of the prosody of ancient poetry with those of the rhyme of modern; it possesses all the varieties of poetical forms from the Latin hexameter to the French Alexandrian verse.

<sup>1</sup> That means a good deal when we consider such diminutive possibilities, like *cista*, *cistula*, *cistella*, *cistellula*.

The Polish language [says Schleicher] distinguishes itself among the other Slavonic idioms particularly by a varied and manifold softening of the consonants. This delicate expression of sounds, produced by the continual variations of the same consonants, makes this language very difficult for the foreigner; but in the mouths of educated Poles it is not harsh at all.

Among the Indo-European languages the Germanic languages possess not one softened (modified) consonant; the Romance languages but one—softened *n* (*gn* in French and Italian, *ñ* in Spanish); the Slavonic languages have several consonants of that kind. Polish, though harsher than several among them, has the most.

The total of words in the Polish language amounts to about 100,000, a great number among them being, as in the Neolatin languages, composed of verbs or nouns preceded by prepositions. The words composed of substantives and verbs or two substantives, so common in German, are very rare in Polish. Almost all the feminine substantives and adjectives in Polish, as in the other Slavonic and in the Neolatin languages (except French) have the termination *a*; and the great number of Polish words terminating with vowels serve to soften the harshness of the language indisputable in other respects.

On the whole, however, we may adopt Schnitzler's statement:

Original, flexible, sonorous as it is, Polish is as rich in forms as it is in words, so that it easily expresses all the ideas to be conveyed and adopts all possible sounds. One may say that Polish is a scholarly language, which has been elaborated, polished, refined by numerous authors, some of whom, men of first order, are justly counted by the Poles among their titles of glory and as a compensation for their political disasters.

Such an account of the most striking characteristics of the language may appear as a digression from my theme, but the language spoken by the people is the very skeleton upon which the structure of their education is built. And as their language is practically unknown with us, it seems to me an indispensable preliminary step to my treatise on the higher education in Poland.

#### SKETCH OF THE HIGHER EDUCATION IN POLAND DURING HER INDEPENDENCE.

The introduction of Christianity into Poland under Mieczyslaw, or Mieczko, to use the abridged form of his name, took place as already stated, in its Latin form. The Latin alphabet was adopted, and the Latin language became the sacred language of the nation. From the church, Latin soon penetrated everywhere, into the schools, the administration, the tribunals, and the domain of history and letters.

The exclusive use of Latin as the literary language during several centuries arrested in Poland all progress and all development of the national language, and, worst of all, debarred the broad masses of the people from participating in the literary movement of the time. But, on the other hand, the knowledge of Latin was soon followed by reading the books of the clerical and secular authors who rapidly spread over Poland. Thus the bad results of "Latinomania," of which

some Polish writers so bitterly complain, were partly compensated by the intense literary aspirations of the higher classes.

Mieczko's successor, Boleslaw the Great (992-1026), in order to spread Christianity more effectively among the Poles, invited some Benedictine monks from France and founded monasteries on Lysa Gora, at Sieciechowa, and Tyneć, and around the monasteries schools of various kinds arose, just like the "Klosterschulen" in Germany under Charlemagne.

From the eleventh century on [says Leonard Chodźko] libraries were established in Poland. In 1166 the historian Matthew Cholewa, bishop of Cracow, incessantly quotes the *Digesta* and the *Institutiones Romanæ*, which had been discovered in Italy about 40 years before. Also quotations from the Roman historian Valerius, all traces of whose works have since been lost, are found in the Latin chronicles of that Polish bishop. The Polish schools and libraries in the twelfth century were in the same flourishing condition as those of the Latin races.

Jan Długosz (Longinus), the famous canon of Cracow (1415-1486), in his most important Latin chronicle, extending from the earliest periods of his country's history to his own time, speaks of Polish schools that were said to have existed in Poland during the eleventh century.

At the end of the thirteenth and the beginning of the fourteenth centuries the young Polish students frequented the universities of Padua, Bologna, and Paris, in which several of their compatriots, as Nicolas of Cracow, Jan Grot de Huplé, and Przesław, were installed as professors and even rectors.

There was even a dim, flickering light of natural science awakening in Poland, inasmuch as the mathematician Ciołek (Vitellio), who lived in the second half of the fourteenth century, became one of the originators of the science of optics.

The reign of Casimir the Great (1333-1370) marks the dawn of a new era in the literary, educational, and political history of Poland. This King, who at the diet of Wislica, in 1347, had the celebrated statute of Wislica enacted—the first monument of Polish jurisprudence, and a code destined to rule the Kingdom according to principles of higher statesmanship<sup>1</sup>—is the founder of the University of Cracow.

*Ancient foundation of the University of Cracow; its early history.*—The city of Cracow had become prominent as the capital under Ladislaus Lokietek (lokietec, an ell), who was the first monarch crowned there. Under his great son and successor, Casimir III, Cracow (also Danzig) became a member of the Hanseatic League.

In 1364 the foundation of the University of Cracow was laid in the

---

<sup>1</sup> The most eminent Polish jurist, Francis Wolowski, states concerning the statute: "One is struck with astonishment at the thought that this first Polish code, remarkable by its wisdom and the clemency of its dispositions, precedes by nine years the celebrated golden bull of Emperor Charles IV of Germany, which in relation to its penal legislation still breathes to a high degree the barbarities of the Middle Ages." In the statute there is a strong attempt to raise the wretched condition of the "misera contribuens plebs," which procured for Casimir the title of honor of "the peasants' king" (Król chłopów).

village of Wawel (now Kazimierz, the suburb of Cracow). Podezszynski maintains its creation in 1347, which date would make it the oldest university of the north and east of Europe. But Lelewel, the best authority, has put it in 1364,<sup>1</sup> and Friedrich Paulsen, in his admirable *Wesen und Geschichtliche Entwicklung der Deutschen Universitäten* (*Die Deutschen Universitäten*, W. Lexis, I, Berlin, 1893), states:

Prague and Vienna are the first founded German universities, the former<sup>2</sup> established in 1348 by the house of Luxemburg, the latter in 1365 by the house of Habsburg, both on the eastern side of the German domain of culture, apparently for the reason that Paris was near enough to the west, with which the oldest church institutions on the Rhine, especially Cologne, were closely connected. Only toward the end of the century did the west of Germany follow with the universities of Heidelberg (1385) and Cologne (1388, discontinued 1794), Middle Germany with Erfurt (1392, discontinued 1816). The dissolution of the University of Paris, owing to the great church schism, brought about the foundation of these three universities.

In Cologne, the old seat of scholastic education, Albertus Magnus and Thomas Aquinas, as well as the Minorite, Duns Scotus, had excelled. To replace Prague, lost to the Germans by the Hussite troubles, the University of Leipsic was founded in 1409, that of Rostock for the Baltic countries in 1419.

This digression is made to show that Poland was not behind Germany in her aspirations, at least for educational excellency, and was well nigh the first to found a university.

Organized after the model of that of Paris, the University of Cracow propagated in Poland all the sciences cultivated at that time in France, grammar, logic, metaphysics, the physical and mathematical sciences, jurisprudence, politics, morals, astrology, and music, i. e., a *studium generale* of the three faculties—law, medicine, and philosophy.

Thus, like the German universities, and preceding all but one, Cracow derived its origin from Paris, the first great university of the Occident, "*ex diluvio scientiarum studii Parisiensis*." Yet the independently created universities of Italy, especially that of Bologna, originating in a law school, must have exercised their influence upon Cracow. While, then, the oldest universities of France, Italy, Spain, and England date back to the thirteenth and with their roots to the twelfth centuries, the oldest Polish and the German universities take a contemporaneous start in the second half of the fourteenth century.<sup>3</sup>

<sup>1</sup> Perhaps he accepted as date the year 1364 because in this year Pope Urban V raised it to the rank of other similar institutions in Europe.

<sup>2</sup> The university was divided among four nations—Bohemians, Poles, Saxons, Bavarians. The spirit of rivalry among them was strongly manifested in the quarrels which took place between the national and the German party. A privilege granted to the Germans and revoked by Charles IV on the 6th of October, 1409, produced such discontent that all the German students left Prague, which caused the foundation of the University of Leipsic.

<sup>3</sup> At the same time a reform of education was begun among the lowest strata of the nation. Primary schools were established throughout the country admitting the children of the peasants as well as those of the nobles.

Of course, the University of Cracow had its vicissitudes and drawbacks. There was at first a lack of professors, and consequently no definite results of teaching were obtained. Under Casimir's successor, Louis of Hungary (1370-1382), the university came to a standstill, and the Polish students passed over to Prague, where they formed one of the four nations. The French and Italian universities were also frequented by many Polish students who later on obtained fame in their fatherland. But the plan of Casimir in regard to the University of Cracow was fully carried out by Queen Jadwiga and Ladislaus Jagiello of Lithuania. The statutes of the university were approved by Pope Boniface IX, its revenues raised by the Queen in 1397, and the institution transferred to the center of the city in 1400. Throngs of students from all Poland, Hungary, and Germany assembled there and carried its fame in all directions.<sup>1</sup>

Under the Jagiellons (1386-1548) the Polish language, so long displaced by Latin, began to reconquer its ancient privileges. It owed its success especially to the Hussites, who had entered Poland in order to recruit in favor of their doctrines from all ranks of society that could be reached only by means of the national language. The Polish humanists and reformers<sup>2</sup> also used Polish in their liturgies, printed in the vernacular catechisms, sermons, religious songs, employed it in their controversies, and thus forced their adversaries to reply in the same idiom.<sup>3</sup>

Printing began at a very early time in Poland (Estreicher, Polish Bibliography, Cracow, 1870). As early as 1475 we find a Silesian-Polish imprint in a Latin work, *Statuta Synodalia*. In 1476 appeared a work by Turrecremata (Torquemada), *Explanatio in Psalterium*, published in Cracow. Since that time the printing press has not stopped in Poland.

In 1491 Swiantopelk Fiol printed at Cracow a book of prayers in Slavonian, with Cyrillic letters. In the beginning of the sixteenth century, Haller, a citizen of Cracow, established the first regular book trade, employing at first foreign presses, namely, those of Leipsic and Nuremberg, but afterwards establishing his own printing office at Cracow. Haller rendered great services to the progress of literature in Poland by publishing himself many works, and by supporting other printers with advances of money and types, so that many new printing offices were soon opened at Cracow.

<sup>1</sup> Huss's fellow-martyr, Hieronymus of Prague, was called to Cracow in 1410, in order to help at the reorganization of that university.

<sup>2</sup> Kallenbach, *Les Humanistes Polonais*, Fribourg, 1891.

<sup>3</sup> A very interesting and most important transaction between Poland and Bohemia was the public disputation held at the University of Cracow in 1431 between the Hussite deputies of Bohemia and the Roman Catholic doctors of the university. The disputation was carried on in the presence of the King and the senate. Dlugosz, who relates that memorable transaction, says that the conferences were almost continually held in Polish. The fact alone that heretical tenets were suffered to be publicly discussed at the university is sufficient to prove the state of toleration at that time prevailing in Poland.

The first Polish book, a life of St. John Chrysostom, by St. Bonaventura, translated by Opec, was printed at Cracow in 1522, by Vietor; and in 1536 the Catechism of Luther was also published in Polish. The liberty of the press, established by royal ordinance in 1539, was sustained in spite of all attempts to suppress it during the fierce religious struggles raging at the time in Poland as well as in western Europe. Printing establishments were even increased in all parts of Poland, for the Reformers tried to spread their doctrines by the press, and their Catholic opponents to refute them by the same means.

The followers of the Greek Orthodox Church in Poland, whose spiritual center was in Kief and its famous Greek seminary until 1667, when lost to Muscovy forever, had also several presses of their own.

The religious struggles, fatal as they were in many respects, yet had a powerful influence on the development of the national intellect. Theological controversies compelled those concerned in them not only to be well versed in the Scriptures and the works of the church fathers but also in the ancient languages, Polish dialects, and many other kindred branches of human learning. Works not only of a religious and controversial but also of a literary and scientific character went forth in great numbers from the presses established in various parts of Poland. There were even many private presses established by nobles in their own houses; thus the Tarnowskis, Radziwills, Chodzkievich, and several other magnates possessed printing establishments. Bandke, in his History of the Press in Cracow, even enumerates 46 towns outside of Poland where the productions of Polish authors were also printed.

This glorious elevation of liberty of the press and education did not, however, last undisturbed. Under the reign of Sigismund III a kind of censorship was introduced by a royal decree of the 14th of October, 1621, prohibiting the printing or even the custody of any works whatsoever, but particularly those of a sacred character, without a license from ecclesiastical authority. The resolution adopted by the synod of Warsaw under the primate Lubieski (*De non imprimendis absque revisione et approbatione libris, ac revidendis ad minus semel in anno bibliothecis bibliopolisque*), which not only confirmed this royal decree, but extended the censorship by establishing an inquisitorial revision of libraries and booksellers' shops, became from that time a law, and its application was stringently adhered to. Under this law, which soon extended its sway over books of the past, excesses were committed, and a good number of the best productions of the golden age of Polish literature must have been irrevocably lost, and many became so scarce that even at our time some valuable unique copy is now and then found hidden away in the dust of old Polish libraries.

This short account of the Polish printing press may perhaps appear as a digression from our theme, but the universities and high schools of that time were so closely connected with the new printing facilities

that they can hardly be appreciated without the latter, being the most powerful engine for the dissemination of the truth and of all learning.

Thousands of students gathered at the University of Cracow in the fifteenth century from Ruthenia, Russia, Germany, Hungary, and Moravia. The first Ruthenian, Latin, Hebrew, Greek, and Hungarian books proceeded from its printing press. At the beginning of the sixteenth century it extended all over Poland. The number of books printed in Poland during the sixteenth century amount to 10,000 at a low calculation. More than 500 printing presses had been up to the end of the eighteenth century active in about 100 towns of the realm, 90 in Cracow alone.

One of the most interesting buildings in Cracow is the old Jagiello Library, with its quaint quadrangle. Here is stored a fine collection of books and many of the rarest treasures of the Polish press, early editions of the native authors. "In an album preserved in the library, with the names of visitors inserted, may be seen the autograph of Henry of Valois, Marini, Mniszek, the bride of the False Demetrius, and that of Anna Jagiellonka, the wife of the glorious Stephen Batory" (Morfill). All these treasures were turned to the advantage of the Jagiellon University.

Among the most famous students of this university at that period we must count the above-mentioned historian and chronicler, Jan Dlugosz; Jan of Glogau, who introduced Aristotle's philosophy into Poland, on which he wrote several works; Michael of Breslau, Jan of Oswięcim and scores of others. But none gave to his country such a luster of splendor and fame as Nicolas Copernic (Copernicus), born in 1473 at Thorn (Toruń), Prussian Poland, died the 23d of May, 1543. The great French scientist, Arago, says of his death: "*Il s' éteignit en tenant dans ses mains défaillantes le premier exemplaire de l'ouvrage qui devait répandre sur la Pologne une gloire si éclatante et si pure.*" A statue of Copernic, by the finest Danish sculptor, Thorwaldsen, adorns one of the public squares of Warsaw.

It is true Poland and Germany still dispute with each other the honor of producing him, a common fate of all great men in olden times; but this much is sure, that his father, a Polish subject, was a Slav, though perhaps Germanized, his native town having recently belonged to the order of the Teutonic Knights. His mother, as her name—Barbel Watzelrode—indicates, must have been of German extraction. Brought up under the guardianship of his uncle, Lucas Watzelrode, subsequently prince-bishop of Warmia, he matriculated at Cracow in 1491, and there studied mathematics, optics, and perspective. Leaving Cracow without taking a degree, he enrolled himself in 1496 in the "*Natio Germanorum*" of Bologna University as a student of canon law. The year 1500 he spent at Rome, where he lectured on astronomy and "observed an eclipse of the moon" on the 6th of November. The following year he began the study of medicine at Padua, medicine being

at that time essentially dependent on astrology. In 1505 he left Italy never to return to it, and settled in Prussia.

He is the founder of modern astronomy. The Copernican system is, mainly, the shifting of the center of the solar system from the earth to the sun, and the consequent explanation of the alternation of day and night by the earth's rotation on its own axis, and of the change of the seasons by the earth's revolution around the sun. For the rest, the glory of developing the lines so broadly laid down belongs to Kepler, Galileo, and to Newton, who finally marked out the form of modern theoretical astronomy.

Under Sigismund I (1507-1548) political struggles with the Tartars and Turks and the rising power of Russia strangely contrasted with literary achievements. His second wife, Bona Sforza, daughter of the Duke of Milan, though personally hurtful to her adopted realm on account of her intrigues and avarice, yet had a beneficial effect upon the country by the introduction of painters and artists of various kinds and Italian refinement to embellish the Polish court.

The new doctrines of the Reformation made their appearance in the country. The centrifugal forces began to tend in different directions; the Protestant towns of secularized Prussia, and still more the Polish towns proper that had adopted Lutheranism, gradually became estranged from Poland at the time when royalty was being weakened more and more, and the nobility with their unmeasured privileges spread the sphere of their influence ever farther.

But in the clash and conflict of diverging tendencies lay the germ and ferment of a higher educational and intellectual life. The influence of the Renaissance began to be felt in Poland, and when the classical models of Greece and Rome pervaded the national spirit of the Polish republic of letters the national language assumed an exquisite purity; its golden age and classical period began (1541-1606). But the University of Cracow had somehow degenerated, and King Sigismund, in order to raise its standard, in 1535 ennobled all the doctors and professors of the same, uttering the following grand words: "*Satius enim est gestis propriis florere quam maiorum opinione uti nec minor nobilitas est ea quæ propriis virtutibus comparatur*" (Morfill, Poland, p. 82).

But trouble soon began again. It may not be uninteresting as a piece of history of culture in Polish university life of that time to speak here at some length of an event by which the beginning of the reign of Sigismund Augustus was marked, and which, although insignificant in itself, was important from its consequences.

In 1549 a woman of ill repute, being publicly insulted by some students of the university who stood before the door of All-Hallows College, called to her assistance the servants of Czarnkowski, prebendary of Cracow and principal of this college. A scuffle ensued, in which some students were killed. This occurrence produced a universal commotion amongst all the students of the university, who entered

into a mutual obligation to obtain a signal satisfaction for the murder of their comrades. The whole body of the students went to the royal castle to supplicate for justice against the perpetrators of the murder, but particularly against Czarnecki, whom they accused of being the chief promoter of that crime. Samuel Maciejowski, bishop of Cracow, dissuaded them from thus marching to the castle, representing it as an insult to royalty, and promised to obtain for them full redress.

They retired from the castle, and, having confirmed their mutual obligation to prosecute the guilty, they chose one of their number to lead the prosecution. They declared also that if they should not obtain justice they would leave the university and even the country. The King granted an audience to a deputation of the students, who preferred an accusation, the violence of which shows the hatred which animated them against the ecclesiastical authorities and which waited only for an opportunity to manifest itself. The King blamed the riotous conduct of the students, and ordered the affair to be investigated by Samuel Maciejowski, bishop of Cracow, as chancellor of the university, a prelate distinguished by the mildness of his character and urbanity of his manner. The students did not appear before the judge, considering him as a partial one, and refused to prosecute their accusation. Czarnecki, having proven that he had not even been in the house when the tumult arose, was justly declared innocent, but the servants were imprisoned. As no accuser, however, appeared, there was no trial. The students resolved on leaving the university. It was impossible to use any coercion against such a resolution, and the authorities tried by conciliatory means to prevent its execution.

The students were invited to the Church of St. Francis, where they found assembled all the university, the bishop of Cracow, and Jan Tarnowski, the most respected grandee of his time. They were addressed by Tarnowski, who promised them the punishment of the guilty, and who was listened to with great attention; but when the bishop wished to speak he was interrupted and could not obtain a hearing. The students left the church with great tumult and resolved on leaving the city the following day. Cracow exhibited a mournful scene; nothing was heard but groans, lamentations, and parting farewells. The town lost the most animated and brilliant part of its population. According to the word of Zalasowski, a contemporary author, in his *Jus publicum Regni Poloniae*, "the schools became silent; the halls of the university were deserted; the churches were mute, and the oldest inhabitant of Cracow had never witnessed a greater calamity and a more general lamentation."

The emigrant students assembled together, heard mass in a church of the suburb Kleparz, and began their pilgrimage singing a sacred hymn. Some of them were persuaded to return, but the greatest part left the country and repaired to foreign universities. Most of these went to Silesia, where the celebrated school of Goldberg was at that

time in a very flourishing condition, under the direction of Frankendorf, the most eminent of Melanchthon's pupils. This school was already the favorite resort of many Polish students. The later royal family of Leszczynski was one of those who generally educated their children in that establishment. Many went also to the newly erected University of Königsberg, in Prussia, which was a Protestant stronghold under the duke, Albert of Prussia, who had adopted the reformed creed. No wonder, then, that most of them returned to Poland imbued with Protestant doctrines and as zealous propagators of such in their Catholic country.<sup>1</sup>

Yet, in spite of drawbacks and religious struggles, the progress of Polish literature and literary achievements went on.

Nicholas Rej (1505-1569)<sup>2</sup> opens the long list of great Polish poets, though his best work, *Zwierciadło albo żywot poczcivego człowieka* (The Mirror; or, The Life of an Honorable Man) was written in prose.

Martin Bielski wrote in Polish the *Annals of the History of Poland* and a *Universal Chronicle*, the first universal historical work that appeared in Europe. Great historians, philologists, jurists, scientists, and the most illustrious Polish poet, Jan Kochanowski, make us well understand that the sixteenth century was the golden age of Polish literature.

Another cause of this marvelous development is that merit was a veritable title of nobility. Talent could attain any office, however elevated.

Every bishop, every senator, every high magistrate [says Leonard Chodzko] owed at that time his elevation to his talents, and the son of a noble, a burgher, or a peasant found the same admittance. The historian Kromer, son of a peasant, and the poet Dantiscus, son of a brewer, rose consecutively to the bishopric of Warmia with the title of prince-bishops. Erasmus Ciolek, natural son of a wandering musician, became bishop of Płock. Janicki, son of a cartwright, obtained the poet's crown from the hands of the Pope. Cardinal Stanislas Hosius, one of the presidents of the Council of Trent, was born in Wilno, of very obscure origin.

We can infer from this what the condition of the schools in Poland at that time must have been.

Not only did the lower and middle classes produce highly educated men, but the nobles also rivaled in culture and education at a period when the nobility in France and Germany, with the exception of men like Franz von Sickingen and especially Ulrich von Hutten, were sunk in ignorance. The famous French historian, De Thou (Thuanus), speaking of the embassy of Polish nobles who came to offer the crown of Poland to Henry of Valois in 1572, says:

The most remarkable thing was their facility in expressing themselves in Latin, French, German, and Italian; these four languages were as familiar to them as their own tongue. There could be found only two men at the court who could respond in Latin, the Baron of Milhau and the Marquis of Castelnau-Maurissière. These had

<sup>1</sup> V. Krasinski, *The Reformation in Poland*, London, 1838, Vol. I, pp. 155-159.

<sup>2</sup> V. Krasinski, *The Reformation in Poland*, Vol. I, p. 161.

been dispatched expressly in order to sustain in this respect the honor of the French nobility that then blushed at their ignorance. And indeed it was a great deal for that time to blush at all. The Poles spoke our language with so much purity that you would have rather taken them for men born on the banks of the Seine or the Loire than for inhabitants of the regions watered by the Vistula or the Dnieper, which gave great shame to our courtiers, who know nothing and who are declared enemies of all that is called science.

Rightly indeed Erasmus of Rotterdam says of the Poles in his letter to Severin Bonar, "In that country philosophy possesses excellent disciples; there it forms those Polish citizens who dare to be scholars." The famous Muretus (1526-1585) also, when comparing the two nations considered the most polished and scholarly at that time, the Italians and Poles, asks himself:

Which of the two nations is the one that deserves to be praised more in regard to the sciences and arts? The Italians, the fifth part of whom hardly study Greek and Latin and show some taste for the sciences, or the Poles, a great number of whom perfectly know the two languages and seem to be animated by such an ardor for the letters that they devote their whole lives to them?

Under Stephen Batory (1576-1586), a powerful and well-meaning monarch, due regard was paid to letters and education. He founded for Lithuania the University of Wilno under the superintendency of the Jesuits, who, in order to counteract the spread of Protestantism in these Catholic countries, were now swarming into Poland in great numbers, and gradually became the masters of the educational system of the country. But this university was unfortunately at that time not a bulwark of the Polish or even White Russian language, which continued in use in judicial proceedings as late as the year 1697 in Lithuania, for Batory, originally a prince of Transylvania, can not be said to have had a strong inclination for the Polish language, and the Jesuits also by far preferred their church Latin. Šafařík even accuses Batory of having directly done harm to the Polish vernacular by favoring Latin too much at its expense. He also founded Jesuit colleges at Dorpat and Riga, Livonia having been united to the Republic in 1561,<sup>1</sup> and he proved an offensive foe to Lutheranism. A convent of Jesuits was founded at Riga under the direction of Laterna, Skarga, and Brückner, all three zealous propagators of Catholic restoration in Poland. Reproaches against these men that they were wanting in patriotism are certainly unjust and unfounded. Skarga's sermons, preached before the diet (Kazania Sejmowe, 1600), remind the Poles with ardent eloquence of the suicidal consequences of their disunion and reproach them for their utter want of unselfish patriotism. His funeral discourses at the burial of Batory's widow and the first wife of Sigismund III are not unlike those of Bossuet in powerful eloquence.<sup>2</sup> But violent riots followed the King's attempts to suppress Protestantism in Livonia, and a probable religious war was only averted by his death, when he

<sup>1</sup> Riga and Livonia were lost, however, by Poland to Sweden in 1621.

<sup>2</sup> Mecherzynski, History of Polish Eloquence.

was just about founding a university in Livonia, which thirty-five years later was lost to Sweden.

In Poland and Lithuania, however, Catholicism from this time on had the upper hand and molded the education of the country.

The University of Wilno was founded by Batory as the chief seat of the Jesuits in Lithuania, in the center of a population a large majority of which was Protestant and Greek. A great opposition arose against its foundation. Prince Radziwill, palatine of Wilno and grand chancellor of Lithuania, as well as the vice-chancellor, Eustachius Wollowitz, refused to fix the seal of the State to the charter for the university; but the King disregarded their representations. Also the diet of 1585 protested against the erection of the University of Wilno, and of the Jesuit college in the newly conquered town of Polock, deeming the sole authority of the monarch insufficient and unconstitutional. But the influence of the King prevailed over the opposition of the diet and the privileges of these foundations were at last confirmed. The University of Dorpat was founded by the Swedish King Charles XI, and became a bulwark of German learning. Only in these days is it becoming thoroughly Russianized; it has now even lost its old name, the Russian name for it being Jurjew.

But with the reign of Sigismund III (1587-1632), the continuous wars and foreign invasions, the bloody religious, external, and internal strifes, which retarded civilization in all eastern Europe for centuries, made a speedy end to that great period in Polish literary history. Foreign elements came up to take charge of the public instruction in the country in spite of the opposition of the University of Cracow. Briefly, the old maxim of "*Inter arma Musæ silent*" proved true again. The above-mentioned period of decadence, the macaronic period, set in, barely illuminated by a few superior lights. Polemical divinity, the principal subject of instruction in the schools, made the students lose their time in dialectic subtleties and quibbles. About 1618 the censorship was established in Poland, though contrary to a royal decree of 1539, which had proclaimed the liberty of the press. The first index librorum prohibitorum was published by the bishop of Cracow in 1617. The University of Cracow had a hard struggle with the Jesuits, who worked hard to get possession of this ancient seat of learning. They tried to establish a high school of their own at Cracow, which would have facilitated the final accomplishment of the object. This occasioned a violent quarrel between the Jesuits and the university, which was supported on that occasion by all the monastic orders. The issue was decided in favor of the university by the Diet of 1628, and a papal bull of 1634 prohibited its renewal.

The Jesuit schools spread over Poland, and the superintendence of national education was in their hands. Broscius (Brozek), rector of the university of Cracow, and the most learned man of his time in Poland, in a work published in Polish, about 1620, under the title *Dialogue*

between a Landowner and a Parish Priest, violently attacks their system of education.

The Polish language, which had attained a high degree of perfection during the sixteenth century, the Augustan-era of its literature, was soon corrupted by an absurd admixture with Latin and barbaric phrases, called "macaronic," which disgraced native literary productions for more than a century. Bombastic panegyrics, lavished on the most unimportant persons, became, toward the end of the seventeenth century, almost the only literature of the country—proof sufficient of the degraded state of the public to which such productions could be acceptable. A further proof of the intellectual degradation and the corruption of taste at that time in Poland is that the most classical productions of the golden era of Polish literature were not reprinted during a space of more than a century, although after the revival of learning they went through many editions and still continue to be reprinted. Thus the poems of Jan Kochanowski (died 1584) were printed several times before 1639; but from that year there was no new edition till 1767, which has since been followed by many others.

*Polish schools at the period of the Reformation.*—With the spread of Protestantism the need of Protestant schools was felt. Several general synods, chiefly those of Piotrkow (1578) and of Thorn (1595), acknowledged the necessity of establishing a general school of highest learning for all the Protestant confessions, and resolved to put such a plan into execution by means of a fixed tax on all the landowners belonging to them. This resolution was, however, never carried out, probably from the adverse circumstances of the Protestant denominations during the long reign of Sigismund III. The University of Königsberg might be considered in some respects as the Protestant school of highest order in Poland, at least as long as its founder, Duke Albert of Prussia, as Polish vassal, was guided by political and religious motives favorable to the Republic. Thus Königsberg, as well as the German and Dutch universities, was chiefly frequented by Polish Protestants who wished to receive that theological and other education which was necessary to qualify them for the office of Protestant ministers. They received, however, an education preparatory for those higher studies in properly Polish schools, supported by the various churches and Reformed magnates.

The most remarkable of those schools was that of Leszno, or Lissa, now in Prussian Poland, then the property of the illustrious family of Leszczyński. A member of that family, Raphael, having embraced Protestantism, gave the Roman Catholic church of Leszno to the Bohemian brethren (1550), and established there a school in 1555, which was much enlarged by his descendant, Andreas, palatine of Brest, in Kujawia, in 1604. From humble origins this school rose by the munificence of its owner, Raphael, palatine of Belsk, to be one of very high order for the Helveto-Bohemian confession. The city itself rose to a

high degree of prosperity by the immigration of many thousands of Protestants, who fled to Great Poland after the defeat of the "winter king" Frederick, palatine of the Rhine, at the battle of Weissenberg. Besides the ancient languages, universal history, geography, the Polish and German languages, mathematics, natural history, and other sciences were taught in that school, conducted by men of the highest learning, as Rybinski, Andreas Wengierski, the great naturalist Johnstone, and John Amos Comenius.

The latter, perhaps the greatest educator of all times, born in 1592, at Komna, in Moravia, whence he derived his name, driven out, as Protestant minister, from Bohemia and Moravia by the edict of 1624, finally settled at Leszno, in Poland. Having become professor of Latin and pastor of the Bohemian Church, he published, in 1631, his *Janua Linguarum Reserata*, i. e., *The Gate of Languages Unlocked*, which rapidly and deservedly gained for its author a prodigious reputation. Had Comenius only published this one book, Bayle rightly remarks, he would have immortalized himself and the Slavonic race. This work, translated into nearly all European languages, and even into Arabic, Turkish, and Persian, was composed for the use of the school of Leszno, published in that town, thus connecting it with his immortal name. It is impossible to give even an outline of Comenius's life and works here, but no educator should forego studying the masterly work of Kvaczala (now professor in the University of Dorpat) on Comenius, who was called by the Governments of Sweden and England, Transylvania and Holland, to reform their respective schools. After a residence of four years at the court of Sigismund Ragoczy, prince of Transylvania, he returned to Leszno and superintended its school till the destruction of that city under the reign of John Casimir. He fled to Silesia, and after long wanderings through Germany finally settled at Amsterdam, where he died in 1671.

The model school of Leszno was frequented by Protestant youths not only from every part of Poland but also from Prussia, Silesia, Moravia, Bohemia, and even Hungary. It justified its celebrity by an excellent organization and a continuous improvement of the methods of instruction. Comenius opened a new road on that important field, while the University of Cracow, the Jesuit colleges in Poland, and all the Catholic and Protestant schools in Germany and Poland alike lost themselves in the old scholastic methods of wasting the precious time of professors and pupils.

While the great Comenius improved the methods of education, nay, revolutionized them, Jan Johnstone, a Pole of Scotch descent, composed for the same school his *Historia Universalis Civilis et Ecclesiastica*, etc., ab orbe condito ad 1633—Leyden, 1633 and 1638; Amsterdam, 1644; Frankfort, 1672—continued till that year, and many works on natural history, monumental for their time, making him "unsurpassed in learning by any of his contemporaries."

Thus Leszno acquired a European reputation by its great men and its printing office, from which issued many important works in Polish, Bohemian, German, and Latin, and which was also provided with Greek and Hebrew types. But these literary establishments of Leszno were involved in the sad destruction of that town in 1656.

But the Protestants of Grand Poland, assembled at the synod of Parcice, resolved to rebuild their old and famous school by subscription. It was really reopened in 1663 and a classical seminary attached to it. Yet, owing to the fact that the family of Leszczynski had passed to the Roman Catholic Church, that a great part of its property was lost, and that the Protestant supporters of the town were generally ruined by war, it never attained its high standard again, although it has passed all the vicissitudes of the stirring history of the country, and exists to this very day, incorporated into and leveled to the present admirable school system of Prussia in her province of Posen.

The Bohemian brethren had also a higher school at Kozminek, established as early as 1553, which enjoyed for some time a great reputation. It dwindled down, however, toward the end of the sixteenth century, into a primary school, of which the Bohemian brethren possessed several in Great Poland, as, for instance, at Poznań, Barcin, Ostrorog, Wieruszew, Loebeń, etc. The instruction given in such schools consisted, in addition to religion, of reading, writing, arithmetic, and Polish grammar, the rudiments of Latin, and in some places of German. The Helvetian confession, which prevailed in Little Poland, had 14 higher schools in that province, including the palatinates of Red Russia, Volhynia, and Podolia. The most celebrated of them were those of Dubiecko and Lubartow. The latter, established and supported by Firley, palatine of Cracow, enjoyed for some time an extraordinary popularity, and was frequented by many Catholic youths as well. But all these schools had only temporary prosperity, and were soon ruined by the want of permanent endowments, the voluntary contributions by which they were sustained diminishing or ceasing with the frequent conversion of their supporters to Catholicism. Thus the school of Paniowce, in Red Russia, founded by Jan Potocki, and apparently of some importance, since it had the privilege of an academy and possessed a printing press, was abolished by Potocki's son, who returned to the Catholic Church. As for primary schools, we may safely assume that every larger congregation had one.

In Lithuania, too, there were quite a number of colleges belonging to the Helvetian Church, supported by the Protestant magnates of the Radziwills, who, although professing the Roman Catholic religion, continued to protect the foundations of their ancestors, and some of them last to this very day.

But, on the whole, it may be asserted that this period also in the Reformed world of Poland was rather barren in regard to the highest education and learning. The many petty but harassing religious

antagonisms between the parties within the church itself hemmed the progress of the Catholic University of Cracow, whose students frequently indulged in excesses; the Jesuit colleges, and the Protestant schools likewise. Many of the best Poles, nobles and divines, had to obtain their education in foreign universities, and, as an indispensable preparation for their academical studies, they were taught foreign languages, to make the foreign literatures accessible to them. In this foreign education, which was brought about by the downfall of the Polish schools of higher order, lies at the same time the reason why these schools could not recover till about the middle of the eighteenth century. The suppression of the anti-Trinitarian or Socinian schools in Poland, especially that of Rakow, which was conducted by scholars, Poles as well as foreigners, who enjoyed a European reputation; that of Lubartow, which belonged to the wealthy magnate family of Kazimirski, and many others; the abolition of their printing offices, prohibiting their restoration under the penalty of civil death, and the banishment of the professors—all left a deep gap in the system of Polish schools of high order.

*Revival of higher education and downfall of Poland.*—To Stanislas Konarski, a priest of the congregation of the Patres pii, belongs the high merit of reorganizing public instruction in Poland, of nationalizing it after the denationalization brought about by the macaronic period, and of giving a new stimulus to Polish literature. He found worthy assistants in the bishops Joseph and Andreas Zaluski, who established at their own expense a public library of 200,000 volumes at Warsaw, which they made public in 1747. When Stanislas-Augustus Poniatowski ascended the throne in 1764, a general movement of renaissance in Polish literature took place, which was zealously accelerated by the King. He also founded at Warsaw the "school of cadets," the nucleus of the now famous university. In order to encourage teachers and students by his presence, he used to come to the examinations held at that school, and had a familiar intercourse with the professors, whose erudition and works he liberally rewarded by the highest offices. After the suppression of the Jesuit order by papal decree, he employed their confiscated property and extensive estates to found and endow schools. Under his reign a commission of national education was established in 1775 to administer and perfect public instruction. This institution was, according to Forster, the first supreme magistracy of the kind in Europe, which sustained the reformed universities of Cracow and Wilno and hundreds of new schools by the funds obtained from the estates of the Jesuits, who had been expelled from Poland after the suppression of the order by Pope Clemens XII.

There is only one other State—namely, Prussia—which, after the destructive defeat of Jena and Auerstädt in 1803 and the subsequent loss of all her provinces on the left side of the Elbe, tried to compensate the material loss by an ideal gain, by the foundation of the University

of Berlin in 1810. Just in the same way, Poland, after the first dismemberment, in 1772, organized the said commission of education in 1773<sup>1</sup> and made it a government institution in 1775.

Of course the influence of the philosophy of the eighteenth century, the so-called period of enlightenment, and the progress in the system of teaching, the study of Montaigne, Komenski, Locke, Basedow, and Pestalozzi, and the spread of the influence of the encyclopædists had everywhere slowly created a sentiment in favor of good schools; in Poland, during the time of her misfortune, more than anywhere else the conviction took possession of many minds that good schools and higher education were necessary for the salvation of the country and for the moral and material progress of the nation. The King deemed it to be the duty of the Government to promote and aid schools of all grades for the promotion and extension of education, and the vice-chancellor of Lithuania, Joachim Chreptowicz, introduced a bill in the Polish diet of 1775 to make the commission of education a government institution. The act gave to the commission the exclusive right to control and govern all the Polish universities, colleges, academical colonies, and all the public schools. The commission was composed of the ablest men; among them were Andrew Zamoyski, Count Ignatius Potocki, Prince Adam Czartoryski, Prince Michael Poniatowski, bishop of Płock; Julian Niemcewicz, the famous poet; Gregor Poramowicz, Pater Kopczynski, and Pater Hugo Kollātai, the latter being the soul of the commission, an able and aggressive statesman, a highly cultured and liberal-minded man, a democrat in the best sense of the word. The commission held semiweekly sessions.

The country, so far as it was not annexed, was divided into six school districts. Each district had higher-grade and lower-grade colleges. The universities of Cracow and Wilno were reformed, and a teachers' seminary (normal college) added to each. Each district had inspectors of the schools and methods of teaching; libraries and museums were founded at the universities and colleges; gold and silver medals were coined to stimulate industry by awarding them to the best scholars; talented young men, after graduating from the home schools, were sent to the western and southern European countries to perfect themselves still further and to acquire more knowledge about other nations, their institutions, customs, and character.

The diet of 1793 extended the powers of the commission of education, and placed also the female institutes under its control. After the second partition the Government lost control of almost all its functions and the commission passed out of existence in 1794.

---

<sup>1</sup> In July, 1873, the hundredth anniversary of the commission of education was celebrated at Lemberg (Lwów), capital of Galicia, Austria. In commemoration of that event the "charter of the commission of education" was reprinted in thousands of copies; it was to be the first volume of the "Pedagogical Library" of Lwów.

It is indeed remarkable that Poland, in the short period of her precarious existence, 1775-1793, made far greater progress in learning and produced more works of merit than during the whole period that macaronism dominated public education, a period which lasted nearly a century and a half. This progress of learning began also to exercise a most salutary effect on the state of the church in Poland, which had immensely suffered from the protracted struggle between the Catholics and the Dissidents.

But the Republic was doomed to annihilation. Yet, as if to illuminate its downfall, one of the most fruitful periods of scientific and literary elevation set in,<sup>1</sup> accompanying the restoration of schools, high and low. Krasiecki (1735-1801) was surnamed the prince of poets. His immense genius excelled in the most varied fields of poetry. His *Myszeis* (*mysz*, mouse; *Myomachia*) is a mock-heroic poem, consecrated to the war of King Popiel<sup>2</sup> against the mice of his kingdom. The oddities of the court of King Popiel and the quarrels, strifes, and intrigues of the mice are ingeniously and bitterly sarcastic allusions to the court and Polish nation of the time. It is in its kind—comparable to Sebastian Brant's *Narrenschiff* and Rabelais's satiric works—one of the best mock-heroic epics and the finest monument of Polish literature in the eighteenth century. His fables, too, are one of the master works of Polish literature. Niemcewicz is especially famous by his historic songs, which have been set to music by the Polish composers. Numerous other great literary men, like the historians Naruszewicz, Krasiński, Jezierski, etc., the jurists Skrzetuski and Ostrowski, the publicist Hugh Kollataj, etc., glorified the political downfall of the country. Stanislaus Staszic, born in 1755, a genuine patriot, after the establishment of the short living Congresspoland, at the Congress of Vienna, was named minister of public instruction, in which position he improved the existing schools and established new ones, and raised the University of Warsaw to a much more important position. He also founded an institute for the deaf and dumb and a school of engineering, thus laying the corner stone for the later developed schools of technology in Russia. It is his merit to have advanced the intellectual condition of the country in its political decline.

Another patriot, who devoted himself to the education of the Polish

<sup>1</sup> It is difficult to see how Morfill can find the period of Krasiecki and Niemcewicz and the literature which the political decay of the eighteenth century produced as "harmonizing with its decadence." This statement is as unwarranted as to call Krasiecki a "Polish embodiment of a French abbé;" "his epic on the war of Chomic no epic at all;" "his lighter pieces and mock heroics as pleasing."

<sup>2</sup> The legend of King Popiel, very similar to that of Bishop Hatto (cf. the mice tower on the Rhine), goes as follows: "King Popiel was a vicious man, and had become so hateful to the nation that a conspiracy, headed by his uncles, was entered into against him. He treacherously poisoned his enemies and left their bodies to the beasts of the fields. But numberless rats sprang from their bodies and consumed the king and his family."

nation, raised the Academy of Cracow to a high standard, bringing about a great progress in the education of the country, was Hugh Kollataj. But his efforts to remedy the political evils of the country were thwarted by the blindness of his opponents.

Thus all the brilliancy of the period in literature, history, and education served only to illuminate the end of Poland. From this time on education in Poland has to go through all the phases and political changes of the three countries of which she forms integral parts.

#### HIGHER EDUCATION OF RUSSIAN POLAND.

On April 25, 1795, Stanislaus Poniatowski resigned the crown of Poland at Grodno, and therewith the history of the country under Russian, Austrian, and Prussian rule begins. Emperor Paul treated his Polish subjects with great regard and kindness. His successor, the romantic Emperor Alexander I, also allowed, to a large extent, self-administration and the use of the native language, and in 1803 conferred great privileges upon the University of Wilno.

The crushing defeat of Prussia by Napoleon and the inglorious Tilsit treaty brought to a part of Poland once more a shadow of independence. By virtue of Article V of that treaty the duchy of Warsaw was created in 1807 under the Elector of Saxony, Frederick Augustus. It was composed of almost all the Polish provinces taken from Poland by Prussia in 1772, 1793, and 1795; it had about 2,200,000 inhabitants and an area of about 101,500 square kilometers, embracing six departments—Posen, Kalisz, Płock, Warsaw, Lomza, Bydgoszcz (Bromberg). In consequence of Napoleon's war of 1809 against Austria, in which the duchy participated, the latter was increased by all the land between the Vistula, Bug, and Pilitza, i. e., Cracow, Sandomir, Lublin, and other cities and territories.

This establishment of a national government in the new duchy of Warsaw had a favorable influence upon public instruction. The commission of education was resurrected, and Count Stanislaus Potocki placed at its head. The name was changed first to "chamber of public education," then to "directory of public education," and after the creation of the "congressional Kingdom of Poland," under Russian government, to "commission of enlightenment." Warsaw was endowed with a law school (1808), to which was added in 1811 a school of administrative sciences and a school of medicine. Each province of the duchy was to receive a district college, every village its primary school.

But the invasion into Poland of the confederate armies in 1813 made an end to the attempted reforms. Still the literary movement and the ascendancy of public instruction went on; historians like Lelewel and Albertrandy flourished, numerous literary societies were formed, and the cities and academies rivaled in preeminence as to certain branches. Thus the school of Krzemieniec was superior to that of Warsaw in poetry; Wilno excelled by its school of medicine; while in Warsaw the

Society of the Friends of Sciences contributed very much to encouraging and developing the literary movement. Mickiewicz planted the standard of romanticism in Poland; he is the Polish Victor Hugo. His *Konrad Wallenród* (1828) and *Malczeski's Maria*, a song of the Ukraine (1826), are pearls of epic and lyric poetry unsurpassed in any literature.

Thus the intellectual progress of the Russian part of Poland ever went on and the political dependence did not weigh too heavily upon the country. Russian Poland was to form a constitutional kingdom allied to Russia by personal union, somewhat like Sweden-Norway. The constitution allowed the country was even too liberal, as compared with autocratic Russia, to last very long. Poland was to be governed by responsible ministers, a senate, and a legislative chamber. A national army under the national White Eagle, a separate budget, a free press, and personal liberty, as well as the free use of the Polish language in private and official life were guaranteed; but this good will would and could not last. In 1819 the anti-Russian movement, which steadily increased, made a censorship of the press necessary, contrary to the terms of the constitution; some of the students of the universities of Wilno and Warsaw were imprisoned and tried for high treason.<sup>1</sup> At last the University of Warsaw and a great number of schools and private institutions of learning were suppressed by ukase of November 9, 1831, and the school of cadets at Kalisz by ukase of January, 1832. An ukase of February 15, 1832, decreed that the library of 150,000 volumes, engravings, and the cabinet of numismatics should be transferred from the University of Warsaw to St. Petersburg. The ukase of February 26, 1832, known by the name of "organic statute," destroyed all the stipulations of the Vienna treaty and declared "Poland is an integral part of the Russian Empire; its inhabitants must in the future form with the Russians but one and the same nation. The ministry of public instruction is abolished." All educational institutions of Poland were placed under the control of the department of the Interior in St. Petersburg. Here the school system of Poland begins to become absolutely Russianized in form, spirit, and contents; and it can not be said that, in spite of many hardships, the efforts of the Russian Government were unwise, impracticable, though hostile to the Polish education of the Polish nation.

In place of the closed university a "general college" was opened for the purpose of teaching law and classics. The nobility and bureaucracy had separate philological provincial colleges, while the other classes ("le tiers état") were educated in the so-called "real-gymnasia" with a more technical training. According to the ukase of Czar

<sup>1</sup> In 1830 Warsaw had the following higher educational institutions: The university with about 600 students; three classical gymnasia (lycea); one polytechnic school, founded in 1825; one agricultural college, founded in 1816; one school of forestry, founded in 1816; one musical conservatory; four seminaries; three female high schools with 830 pupils.

Nicolaus I in 1840 the purposes of education in Poland were to arouse the love of religion and monarchical government and the acquisition of special technical knowledge.

Mr. W. A. Day in his *Russian Government in Poland* (Longman, Green & Co., London, 1867), the best and most impartial book on the subject, based on the best and most reliable Russian sources, speaks about the educational events of that epoch in substance in the following way:

Warsaw and Wilno were the seats of two universities, where men of the Polish race had long been educated; they possessed libraries and collections, the relics of old times, the memorials of an age when Copernicus taught and Sobieski ruled. These institutions were regarded by the Emperor as memorials of that past which it was his mission to crush out. If he suppressed them, he thought he would destroy two of the rallying points of disaffection and revolt, so his mandate went forth, and the universities were closed.

The libraries and collections they had contained were transferred to St. Petersburg and Kief, and Poland and the western provinces were deprived of their accustomed means of education. No longer possessing them in their own neighborhood, the nobles of the Kingdom were compelled to send their sons to the distant universities of Kief, Moscow, and St. Petersburg. Some of the poor students, who were unable to afford the cost of an education, were supported at these universities on condition that after leaving it they should pass several years in the public service. Thus, far away from their own land, the Emperor anticipated that they would forget the misfortunes of their country, that they would cease to look back on its past history with vain repining, and that they would devote all their energies to the service of the Empire.

The result did not answer his expectations; in many instances it prevented the poorer proprietors from affording a liberal education to their sons, and frequently the wealthier classes refused to part with their children, as they objected to the long and remote separation rendered necessary by their distance from the Russian universities. And the wealthier proprietors were unwilling that their sons should enter the public service and they therefore sent them very frequently to some German university to receive their education, and left them to gather it as best they could in the course of foreign travel.

Education was thus in a measure checked by this act of power, but nevertheless large numbers of Polish students went to the principal Russian universities, where, instead of losing their nationality, it became more than ever confirmed.

Sometimes in periods of political excitement they banded themselves together as a distinct and separate body, neither sharing in the sports nor sympathizing in the pursuits of the other students. Thus, in the university of St. Petersburg they formed one-third of the whole body

of students, and in that of Kief they were comparatively even more numerous; in the former they partially and in the latter they altogether refused to associate themselves with the Russians. Oftener, however, they took the lead in daring political speculations, supported the most advanced liberal theories, and endeavored there to prejudice their Russian fellow-students against all the forms of an autocratic Government.

The policy of the Emperor Nicolaus on the subject of education was consistent with the measures adopted in other branches of the administration.

The study of the ancient history of Poland was forbidden or permitted only in the feeble or garbled treatises of Russian scribes, as though every battlefield had not its memory, as though every tomb in the churches, every banner that moldered on their sacred walls, did not teach some passage of her history. The works of foreign authors were rigorously forbidden, and secret commissions punished their study with imprisonment and exile. The visits of foreigners were as much as possible discouraged, and they were subjected to numberless vexatious restrictions, having their speedy departure for their object.

The process of Russification was inaugurated with great skill and executive talent, however painful the systematic policy of destroying an old, historic, and rich civilization might be to the Pole or any other nationalist.

The first act of that process was an act of charity. The poor Polish orphans and waifs, whose parents had perished during the bloody revolution of 1830 or had been deported, were taken under Russian care and protection to be educated in order to become useful Russian soldiers. On the 24th of March, 1832, Prince Paskewitch issued the following order:

It has pleased His Majesty the Emperor that all abandoned male children, orphans, or paupers in Poland be incorporated into the cantonal bataillons, and that accordingly they be taken in a body (*enlevés en masse*) and sent to Mińsk, where they will be disposed of according to the regulations of the generality of His Majesty.

Also the children of the Polish schools of charity, the orphans of the Child Jesus, were taken care of by the Russian administration. An ukase of June, 1832, prohibited the use of the Polish language before those tribunals of Russian Poland which lay outside the Kingdom proper.

The 15th of August Pope Gregory XVI addressed an encyclical to the bishops of Poland (alike in spirit to a recent encyclical of Leo XIII to the Polish bishops in Russia) to submit themselves to their magnanimous Emperor Nicolaus I as their legitimate sovereign. An ukase of June, 1838, prescribes that history and the exact sciences be taught in the Gymnasia (Lycea) in Russian. By virtue of decrees rendered in 1843 and 1845 in regard to the public instruction in Poland, superior and secondary instruction were limited to the technical sciences. To pursue the courses of classical and philosophical instruction the Polish

youths must betake themselves to the Russian universities proper. The communes were authorized to abolish old and incompetent schools according to their best judgment; thus 239 primary schools were closed in the decade of 1845-1855. The revolutionary movement in 1846-1848 forced the Russian Government to new measures of restriction. But a new stimulus was given to the cause of education when the noble Emperor Alexander II, in 1856, appointed Marquis Wielopolski minister of civil government of Poland.

At the accession of Alexander II to the throne, education in Poland was at a very low ebb. The suppression of the University of Warsaw left no establishment in the Kingdom where a superior education could be procured. In all the Kingdom there were only eight gymnasia or institutes for nobles where a secondary education was given, and by law the professors in these institutions were obliged to teach the sciences in the Russian language, though practically this enactment was not always observed, for it was difficult to find professors who could speak Russian, and still more difficult to find scholars to comprehend them.

The elementary public instruction was in a better condition. The number of elementary schools was 1,000, and there were 20 district and "real" schools. Yet even under these improved conditions, in 1860 only 137,417 persons (28 per 1,000) in Poland had obtained a superior education; 325,470 (170 per 1,000) could write and read; 3,877,579 (802 per 1,000), or more than four-fifths of the population, could neither write nor read.

In 1857 the Government had taken the first step toward the establishment of a university in Warsaw by endowing a faculty or academy of medicine there. A further step was taken in 1861, when the Emperor directed the commission of public instruction to elaborate a project of law in order thoroughly to reform the organization of public instruction in the Kingdom. The aim of this scheme was to enable men of every religion and condition to study special sciences there, and allow the common people to acquire all elementary knowledge necessary for them.

The law consequently elaborated was sanctioned by the Emperor, and put in force from March 20, 1862, and consisted chiefly of the following particulars:

Catholic priests and proprietors of towns and villages were allowed to found, at their own expense or at that of the place where they were established, elementary schools for teaching the Catholic religion, reading and writing in the Polish language, and arithmetic, and they could appoint as masters of such schools all individuals having the qualifications required by law for enabling them to take such office. In addition to these, one or more elementary schools were to be founded in each commune at the expense of the Government; these schools were to be placed under the surveillance of the Catholic priests and certain

inhabitants of the commune, elected by the commune itself, and to be subject to their inspection and local administration.

The district schools were to be divided into "general" schools for general instruction; "training" schools for preparing masters for elementary schools, and special or "real schools" for teaching agriculture, trade, and other special subjects.

In addition to the 7 existing gymnasia, 6 more were directed to be added, and instead of the Institute of Nobles a lyceum was founded as an establishment where a supplementary or superior class to those existing in the gymnasia might be taught. The scholars might belong to any religious denomination, and the cost of instruction was only 16 rubles a year.

A polytechnic institute was founded in Pulova, and the plan of the University of Warsaw was sketched out. It was to be composed of four faculties—medicine; philosophy, or physics and mathematics; jurisprudence; history and philology. To the university two seminaries were to be attached for preparing masters for gymnasia and district schools. The polytechnic institute was to be composed of five sections—mechanics, civil engineering, mining, agriculture, and forestry. Students of all religious persuasions were admitted to the university, and the cost of instruction was only 20 rubles a year.

The national language, history, and literature were to be taught in all the schools; the Polish language was alone employed in giving instruction, and the Russian language was only taught in the superior and secondary schools.

Such were the institutions founded in consequence of the decree of March 14, 1861, by the noble and liberal-minded Emperor Alexander II, and his right hand in Poland, Wielopolski. These institutions were intended to pave the way to others of a yet more liberal and national tendency, and to the eventual introduction of a system of constitutional government in Poland, for extended education is the surest preparation for the responsibilities of power.

But the insurrection of 1863 stopped the beautiful free development of a national education in Poland. Yet even under these changed conditions, the fruits of the educational movement were not lost, although partly lost, to Polish nationalism.

Marquis Wielopolski, although animated by sincere patriotism, with great knowledge of his country and the wishes of his countrymen, was nevertheless probably the most unpopular man in Poland. Yet his merits in the improvement of education in Poland were extraordinary. Under him the schools were reorganized and rapidly increased. The university was partly reestablished in 1861 under the name of "Principal School," in 1862 the Marymont Institute was changed into the Polytechnic Institute, and in 1869 the former was raised to the standard of the other Russian universities, all instruction being, however, unfortunately conducted in the official Russian language.

*The new University of Warsaw.*—On June 8, 1869, an imperial ukase was issued to the Ruling Senate (*Pravitelst vuyuschiy Senat*), reading as follows:

Having recognized the advantages of erecting in the place of the now existing Principal School at Warsaw an imperial university, enlarging it in accordance with the local conditions and the legislation on the basis of which the other universities are constructed, we authorize the drawing up, by the minister of public instruction and in the committee for the affairs of the Tsarstvo of Poland, the plans for the establishment and the statutes for the University of Warsaw, and transmitting them to the Ruling Senate, we decree that—

(1) On the basis of these plans and regulations there be established in place of the Principal School at Warsaw at the beginning of the ensuing academic year 1869–70 the Imperial University of Warsaw.

(2) For the support of this university there be turned over the sum of 132,100 rubles, which is at present given for the maintenance of the Principal School, and the remaining sum of 79,680 rubles, needed for the budget of the university, shall be added from the imperial treasury.

(3) The balance necessary for the maintenance of the university in this current year of 1869 in consequence of the change of its status shall be entered into the accounts of expense of the ministry of public instruction.

In the following year (1870) the total of 211,718 rubles required shall be put under the proper heading in the financial accounts of the ministry of public instruction.

(4) All the plans for the construction of the university in place of the Principal School at Warsaw shall be submitted to the minister of public instruction.

The Ruling Senate shall not cease to work for the completion of the proper plans.

ALEXANDER II.

TSARSKOE SELO, June 8, 1869.

The University of Warsaw, like all the Russian universities, belongs, according to Friedrich Paulsen, to the German type of university, which also includes Austria, Switzerland, the Netherlands, and Scandinavia. The word of J. Delyanoff, Russian minister of public instruction, will be unassailable:

We endeavor in everything that concerns educational affairs to accept Germany as a model, and this is very good. Our universities are established after the German type. Germany is the country of higher civilization; its universities stand on a considerable height.

A commission of all the curators of the Russian universities and 7 professors, under the chairmanship of the curator of Dorpat, George von Bradke, in 1862 undertook the modification and advancement of the law of 1835 concerning the universities, not its change. In 1863 the "improved" bill of that commission became law under the minister of public instruction, A. Golownin, who deemed it essential and necessary to make the autonomy of the universities the basis of the law. It consequently transferred the direct administration of the universities to the rector and the academic council, "which shall decide all the affairs either definitely or subject to the confirmation by the curator of the university. The academic council is the center of the internal administration, the highest resort, to which all the other organs are subjected."

Briefly, all this meant self-government of the universities, to the exclusion of the State and governmental power.

Golownin's successor, Count D. Tolstói (1866-1880), soon recognized the necessity of organic changes. The attitude of the students; their excesses of a political nature; disturbances, especially among those of the university, the medico-surgical academy, and the school of technology at St. Petersburg, forced the minister to fix their position legally in harmony with the other higher organs of the State power (1867); collisions in the academic council brought about instructions in regard to the duties and rights of the rector (1868); extremely undesirable results at the reelection of professors, who needed a majority of two-thirds of all the votes of the academic council, caused the abolition of this arrangement.

It was just at this critical juncture that the University of Warsaw was established with the old principal school as its nucleus, and it was but natural that it should receive regulations of its own, especially adapted to the necessities, from a Russian standpoint, of a university of the Tsarstvo of Poland. The other Russian universities received their general statute only in 1884, which decisively transferred the acting power from the academic council and the faculties to the organs of the State, the curator, the inspector, a kind of police supervisor, and the rector.

*The constitution of the University of Warsaw.*—The constitution of the university is given in 11 chapters and 138 sections,<sup>1</sup> of which it may be desirable to make the following brief extracts:

The University of Warsaw consists of the 4 faculties, the historico-philological, the physico-mathematical, the legal, and the medical faculties. It is under the supreme supervision of the minister of public instruction and belongs to the circuit of the curator of Warsaw. He supervises the relations of the university with the minister and the supreme imperial power, decides questions which are not reserved to the minister, and has especially to maintain order and discipline within the university. The immediate administration of the same belongs to the rector, the academic council, the directors, and the faculties.

The Russian language is obligatory in conducting all instruction as well as in all official documents of the university.

The rector is nominated by the minister of public instruction from among the full professors and confirmed by the Emperor. He has the immediate administration of the university and is superior to the officers of the same. The academic council, in which all full and associate professors, under the chairmanship of the rector, have a seat and vote, bestows, at the request of the respective faculties, academic dignities, and has an advisory power with the curator or the minister in the affairs of instruction and inner administration of the university.

---

<sup>1</sup> Ustav Varshawskiego Uniwersytetu, pp. 33.

As to the general features of the Russian universities, their institutions, reforms, administration, I may safely refer the reader to the Report of the Commissioner of Education, 1890-91, pp. 195-242, prepared by Miss Frances Graham French.

The constitution of the universities at St. Petersburg, Moscow, Khar-kov (Charkow), Kazan, Kief, Odessa, is established by the imperial universal statute of August 23, 1884, and by a great number of regulations issued by the minister of public instruction. The University of Helsingfors (Finland) has its own statutes of 1852. The University of Tomsk has so far only a medical faculty, though the other faculties are now in preparation. The statutes of the old German University of Dorpat (Jurjew) and the formerly Polish University of Warsaw do not differ very much from the universal statute except in several incisive points, especially adapted to the purpose of making them centers of Russian learning par excellence. The university of Warsaw under the present curator, Apuchtin, is the center of the educational district of Warsaw, which is one of the 14 educational districts into which the Empire is divided (St. Petersburg, Moscow, Kazan, Orenburg, Charkow, Odessa, Kief, Wilno, Warsaw, Dorpat, Caucasus, Turkestan, West Siberia, and East Siberia). According to the original plan of this division during the reign of Alexander I, at the head of each district a university was to stand, but it is wanting as yet in the districts of Wilno, Orenburg, Caucasus, East Siberia, and Turkestan. All the universities, and in fact most of the schools, of the Empire are under the ministry of public instruction; only certain special schools are under separate ministers. The total contribution for education from the various ministries was 43,884,534 rubles in the budget for 1893.

The board of directors, which consists of the deans of the four faculties and the inspector, is charged with the economic administration, and exercises a judiciary power over the students. The disciplinary power is, first of all, in the hands of the inspector, a police officer without scholarly qualification, who, at the proposal of the curator, is nominated by the minister, and, although dependent on the rector in his activity, reports not directly to the rector but to the curator. With his assistants and servants and with the secretary for the affairs of the students he has to watch over the conduct of the students within the university buildings and, so far as possible, also outside of them. If the good order or good morals are disturbed in the university he has to employ proper measures to restore order.

The university has the right to import books from abroad without censorship as well as the right to publish books without preventive censorship upon the responsibility of the faculties. Each faculty consists of the dean, the full and associate professors, the docenten, and the lecturers. The deans are elected at the meetings of their faculties from the number of the full professors for three years, and, if there are less than 3 such professors in the faculty, also from the number

of the [extraordinary] associate professors. They must be confirmed by the minister of public instruction.

The historico-philological faculty of the University of Warsaw was originally established with 11 professors and 6 docenten.

The instruction in the Polish language as well as in the other modern foreign languages may be given by lecturers in their native tongue.

The following studies were to be obligatory: (1) Philosophy, (*a*) logic, (*b*) psychology, (*c*) history of philosophy; (2) Greek, (*a*) Greek language and interpretation of authors, (*b*) history of Greek literature, (*c*) Greek antiquities; (3) Latin (divisions like Greek); (4) grammar of the Slavonic languages; (5) Russian and the other Slavonic languages and the history of Russian literature; (6) history of general literature; (7) Slavonic philology, (*a*) Slavonic languages—Polish, Czech, Servian, etc.; (*b*) Slavonic antiquities; (8) general history; (9) Russian history.

In the physico-mathematical faculty the academic chairs were originally distributed among 10 professors and 5 docenten: (1) Pure mathematics; (2) mechanics (*a*) analytical, (*b*) practical; (3) astronomy and geodesy; (4) physics; (5) chemistry, (*a*) applied, (*b*) theoretical; (6) physical geography; (7) botany, (*a*) morphology of plants, (*b*) anatomy and physiology of plants; (8) mineralogy, geognosy, and paleontology; (9) zoology, (*a*) anatomy and systematics of animals, (*b*) anatomy of men and physiology of animals; (10) technical chemistry; (11) agronomical chemistry.

The law faculty was to have 10 professors and 3 docenten: (1) Encyclopedia of law, (*a*) encyclopedia of the legal and political sciences, (*b*) the history of the philosophy of law; (2) history of Russian law; (3) history of the Slavonic legislations, with a view to the other ancient and modern legislations; (4) Roman law, (*a*) history of the Roman law, (*b*) dogmatics of the Roman civil law, (*c*) Byzantine law; (5) public law, (*a*) theory of public law, (*b*) public law of the various foreign states, (*c*) Russian public law; (6) civil law and theory of pleading; (7) penal law and procedure; (8) police law; (9) finance law, (*a*) theory of finances, (*b*) Russian finance law; (10) international law; (11) political economy and statistics.

The medical faculty was to consist of 16 professors, 10 docenten, and 3 demonstrators (prosectors), and was to be provided with the necessary clinics and laboratories. One lector, for Russian, German, French, English, and Italian, respectively, was to be appointed.

As to the academic degrees, conditions, and appointments of the docenten and professors at the University of Warsaw, there is no difference from the other Russian universities. I can therefore refer to the Report of the Commissioner of Education, 1890-91, pages 237 to 242. As to salaries, they were fixed in the imperial ukase of 1869 at 5,000 rubles for the rector, 3,000 rubles for the full professors and the inspector, 2,000 rubles for the associate professors, 1,200 rubles for the docenten and demonstrators, 2,000 rubles for the lector in Russian, and 800 rubles for the lectors

in the other modern languages. For the cabinets and laboratories 7,650 rubles were appropriated; for the clinics, 8,000 rubles; for the edition of the university journals and gazettes, 800 rubles.

The matriculation of male students only, connected with many formalities, can take place only at the beginning of the winter semester in the case of such young men as are in possession of a certificate of maturity from a regular gymnasium under the supervision of the minister of public instruction. In the historico-philological and physico-mathematical faculties of the University of Warsaw only pupils of the religious seminaries, after passing an entrance examination, can be matriculated. Also, other friendly disposed persons besides the students can, under certain conditions, be admitted to the courses. Passing over from one Russian university to another can take place only with the permission of the board of directors of the latter institution. When applying for admittance, the student has, with his other certificates, to file his photograph with his own signature. He has to procure from the inspector every semester a new passport and entrance card to the university. The student pays to the university 50 rubles per semester (in the other Russian universities, 25 rubles) and a fee of 1 ruble per weekly hour for the semester (about 15 to 20 rubles). There is, however, an extraordinary liberality in remitting these fees, and even in granting scholarships, to needy but worthy students. These scholarships (*stipendia*) mostly enjoin the obligation upon the student of remaining in the State service for a certain number of years after graduation. Students' societies, deputations, collective petitions, and addresses are forbidden. The punishments that can be inflicted upon students are like those in the German universities—admonition, prison (in the so-called “*carcer*”), removal from the university (*consilium abeundi*), and relegation without the right of passing over to another Russian university.

The complete academic course comprises, for medical students, 10 semesters; for those of the other faculties, 8 semesters. Controlling examinations take place at the end of every semester. After completing his course, the student may obtain scholarships for two or three years, in order to prepare himself for the higher degrees. The requirements of scholarship and attainments are minutely described in the regulations, confirmed by the minister of public instruction. The final medical examination presupposes a preliminary examination in natural sciences after 4 semesters (like the *tentamen physicum* in Germany). There are two academic degrees—that of *magister* and of *doctor*—which are a necessary preliminary for obtaining a professorship in a Russian university.

To the original regulations of June 8, 1869, eleven appendixes (*priloshenia*) were added, to extend and improve the teaching and administering power of the university. These additional decrees were promulgated by the minister of public instruction or the curators of the Warsaw circuit of education from March 18, 1881, to December 27, 1891.

The need of a thorough Polish literary education having been strongly felt, it was at last decided by the committee on Polish affairs to leave it with the minister of public instruction to appoint a professor for Polish literature at a salary of 3,000 rubles. The Emperor having given his consent on January 12, 1882, it was reported by the curator on February 1, 1882.

The regulations concerning the rights of the rector as chairman of the academic council were fixed, the payment of fees by the students arranged, the university library provided with librarians and assistants, the astronomical observatory and meteorological station established, the numismatic cabinet and the museum of antiquities founded: briefly, the university put in working order in every respect.

*Latest statistics of the University of Warsaw.*—According to the statistical data given by the rector of the University of Warsaw, there were on the 1st of January, 1894—

|   |    |
|---|----|
| Professors, ordinary, including the rector.....   | 48 |
| Professors, extraordinary.....  | 12 |
| Privat-docenten, prosecutors (demonstrators in the medical faculty, and lecturers, i. e., instructors in modern languages (the only ones who need not be Russian subjects)..... | 20 |
| Total .....   | 80 |

Of the 47 chairs founded at the establishment of the university and distributed over the 4 faculties, there were 4 vacancies during the last scholastic year—agricultural chemistry, encyclopedia of the law and political sciences, legal medicine, and the clinical chair of therapeutics.

*Number of students*

During the scholastic year 1889-90:

|                             |       |
|-----------------------------|-------|
| Historico-philological..... | 53    |
| Physico-mathematical.....   | 143   |
| Law.....                    | 389   |
| Medical.....                | 579   |
| Total.....                  | 1,164 |

During the scholastic year 1890-91:

|                             |       |
|-----------------------------|-------|
| Historico-philological..... | 53    |
| Physico-mathematical.....   | 138   |
| Law.....                    | 378   |
| Medical.....                | 621   |
| Total.....                  | 1,190 |

During the scholastic year 1891-92:<sup>1</sup>

|                             |                    |
|-----------------------------|--------------------|
| Historico-philological..... | 47                 |

| Total.....                  | <sup>2</sup> 1,173 |

<sup>1</sup> In this year 13 students were excluded from the university by order of the minister of public instruction.

<sup>2</sup> Besides 165 pharmaceutical and 6 foreign students.

During the scholastic year 1892-93 (including 99 pharmaceutical students).... 1, 176  
 January 1, 1894 (including 57 pharmaceutical students)..... 1, 152

The students were distributed among the four faculties as follows:

|                             | Students. | Per cent. |
|-----------------------------|-----------|-----------|
| Historico-philological..... | 29        | 2. 67     |
| Physico-mathematical.....   | 141       | 13. 27    |
| Law.....                    | 351       | 32. 35    |
| Medical.....                | 561       | 51. 70    |

According to religions they were distributed as follows:

|                            | Students. | Per cent. |
|----------------------------|-----------|-----------|
| Orthodox Greek.....        | 192       | 17. 70    |
| Armenian Gregorian.....    | 2         | . 18      |
| Roman Catholic.....        | 624       | 57. 51    |
| Lutheran and Reformed..... | 51        | 4. 70     |
| Hebrew.....                | 216       | 19. 91    |

According to birth there were—

|   | Students. | Per cent. |
|---|-----------|-----------|
| Sons of nobles and state officials..... | 426       | 39. 26    |
| Sons of the clergy.....                 | 47        | 4. 33     |
| Sons of merchants.....                  | 22        | 2. 05     |
| Sons of urban classes (mieshtshan)..... | 531       | 48. 95    |
| Sons of rural classes (krestjan).....   | 38        | 3. 59     |
| Sons of foreign subjects.....           | 24        | 1. 93     |

According to preliminary education there were—

|   | Students. | Per cent. |
|---|-----------|-----------|
| From gymnasia.....                              | 1, 043    | 96. 13    |
| From religious seminaries (Greek orthodox)..... | 37        | 3. 41     |
| From other secondary schools.....               | 4         | . 46      |

These students came from the following educational circuits (okrugi):

|                                  | Students. | Per cent. |
|----------------------------------|-----------|-----------|
| Warsaw.....                      | 828       | 76. 32    |
| St. Petersburg.....              | 19        | 1. 75     |
| Moscow.....                      | 16        | 1. 45     |
| Kazan.....                       | 11        | 1. 01     |
| Orenburg.....                    | 3         | . 27      |
| Western and eastern Siberia..... | 5         | . 46      |
| Charkow.....                     | 5         | . 46      |
| Odessa.....                      | 19        | 1. 75     |
| Wilno.....                       | 56        | 5. 16     |
| Riga.....                        | 36        | 3. 32     |
| Caucasus.....                    | 11        | 1. 01     |
| Kieff.....                       | 38        | 3. 59     |
| Religious seminaries.....        | 37        | 3. 41     |
| Foreign institutions.....        | 1         | . 001     |

In the scholastic year 1893-94 the university granted the following titles and degrees:

|  | As grad-<br>uate stu-<br>dents. | As can-<br>didates. |
|--|---------------------------------|---------------------|
| In the historico-philological faculty..... | 3                               | 1                   |
| In the physico-mathematical faculty.....   | 2                               | 9                   |
| In the law faculty.....                    | 38                              | 27                  |
| In the medical faculty:                    |                                 |                     |
| Physicians.....                            |                                 | 82                  |
| Pharmacists.....                           |                                 | 121                 |
| Dentists.....                              |                                 | 7                   |

*Report of the rector (1893-94).*—The University of Warsaw is composed of four faculties, the historico-philological, the physico-mathematical, the law, and medical faculties, like the other Russian universities, excepting St. Petersburg and Odessa, which have no medical faculties; but the former has, beside the historico-philological, a most admirable oriental faculty.

The work done during the academic year 1893-94 shows that the University of Warsaw is a real universitas litterarum, not inferior to any European school of equal grade in the scope of instruction.

*The historico-philological faculty.*—This faculty consists of three great departments, the classical, Slavonic-Russian, and historical departments.

The principal studies are analogous to those of most of the other European universities here specially adapted to the needs of Polish students who are to be amalgamated to Russian professional, scientific, and literary life. The time to be devoted to study in this faculty embraces four years.

In philosophy there is at present only one chair, to which falls the instruction in psychology, logic, ancient and modern philosophy.

In the Greek language and literature, Greek dialectology, Euripides, Thucydides, as well as translation from Russian into Greek, is conducted by the head professor; the history of Greek literature, an introduction into Aristophanes, translation from Latin into Greek, interpretation of the orator Aischines is conducted by the associate professor of Greek.

The Latin department, conducted by 2 professors, embraces studies in literature, criticism, and hermeneutics in Tacitus, Juvenal, Martial, Cicero's philosophical works, and seminary practice.

Comparative studies of the Indo-European languages, their phonetics and morphology, and Sanscrit proper are taught by 1 professor ordinarius.

Russian and the other Slavonic tongues are taught by 2 professors and 1 lecturer, viz, Panslavic grammar, history of Russian literature in the eighteenth and nineteenth centuries, Russian grammar.

The history of Western-European literature is represented by 1 associate professor, who lectures on the epic poetry of western Europe and modern Greek literature.

Slavonic philology and antiquities are represented by 3 professors and 1 docent, embracing the history of Polish literature, Slavonic literature, and archæology at large, characteristics of the Slavonic races, ethnology, grammar of the Czech and Lusatian tongues.

Western European history, represented by 2 professors, who teach Greek history, German history in the nineteenth century, history of the Middle Ages, diplomatics and chronology, and practical exercises on the history of the Middle Ages.

Russian history, in the hands of 2 professors, treats of the reign of Alexander I and the modern period of Russian history, its ancient period, and the history of Western Russia.

The two principal Teutonic and the romance languages—German and English, French and Italian—are each represented by 1 poorly paid lecturer, generally a foreigner. In these departments lies the weakness not only of the University of Warsaw, but of all Russian universities, that of St. Petersburg not excluded. Instruction in modern languages amounts to mere “*Sprachmeisterei*.” There is not even a beginning of modern philology and critical literature in a university sense, and the contrast with the other highly developed branches of learning is so much the more striking.

*The physico-mathematical faculty.*—This faculty is admirably fitted out with professors and apparatus. All the branches taught in the best universities are here well represented in 22 departments, embracing astronomy, geodesy, botany, mineralogy, and crystallography; general, special, and technical chemistry; experimental physics, zoology, geology, and paleontology; pure and applied mathematics, mathematical physics, physical geography, comparative anatomy, and histology; mechanics and heavenly mechanics.
